4948. That is an argument really for stabilising exchange, is it not, and not for stabilising it at a particular rate?—Yes, I agree with you there, Sir. If it is stabilised once, then that argument is correct. Stabilise it and the outflow of money will be all right.

4949. Just one other question, Mr. Dalal?—But may I supplement my last answer? If you stabilise that exchange at a rate which in the general opinion of the country is too high, and if the country doubts if it can be maintained for all time, then some trouble will begin to arise. Doubt will begin to arise in the minds of the operators of money that the Government may not be able to maintain exchange, and the same trouble will arise.

4950. Yes, I follow that. You referred to the objections to secrecy in regard to the Government remittances, and you mentioned, I think, the sale of council bills as well as the purchases of sterling. Did you imply that there is undesirable secrecy in the procedure for the sale of council bills?—Well, Sir, when there is a sale of council bills there is no secrecy, it is an open operation. But the Government stopped that and began to buy sterling in India, which is the same operation at the other end, and when they started buying sterling at first there was no secrecy. Every morning we knew that Government had bought so much. But gradually we knew this only once a month.

4951. That is the point I want to clear up—that your objection to secrecy related to purchases of sterling and not to the sale of council bills?—No, Sir.

4952. (*Sir Henry Strakosch.*) I am afraid I have to go back to the question which you have just discussed with Sir Reginald Mant, namely, the effect of the raising of the exchange from 1s. 4d. to 1s. 6d., its effect upon the balance of trade, and consequently its effect upon the foreign liabilities of the country. Personally, I am sorry I could not follow the argument which you have advanced in that regard. Let us first take the many liabilities of the country abroad. Let me introduce it by putting this to you. Do prices in India adjust themselves to world prices as they move?—With a fixed exchange, it must.

4953. Therefore it is true to say that gold prices in India move in direct relationship to gold prices abroad?—They must with a fixed exchange, other things being equal.

4954. Whatever the exchange may be fixed at? Let us say it is fixed at 1s. 6d., then at that ratio gold prices in India would move in direct relationship with gold prices abroad?—Once it is fixed, yes.

4955. How do we pay our debts abroad, obviously by shipping goods?—Yes.

4956. Very well, if we ship goods abroad and if prices in India move parallel with prices abroad, why should there be a greater amount of goods going out of the country to pay a fixed foreign debt? That is the point I cannot follow?—But the point is at what rate of exchange it goes out, at 1s. 4d. or 1s. 6d. That was what I was talking of in my answers to Sir Reginald Mant.

4957. May I put it to you then in this way. If a commodity at 1s. 6d. stood at a hundred in the world, gold, that self-same commodity at 1s. 4d. would stand 12½ per cent. higher, would it not?—It should.

4958. Very well, then, that hundred becomes 112·5. Therefore if you reduce your rate of exchange from 1s. 6d. to 1s. 4d., you would be raising the price internally from 100 to 112·5?—Everything else being the same.

4959. But it cannot be the same? That is just the point. If you move your exchange, everything else cannot be the same, because your internal prices, if they are to move parallel with your external gold prices, must move accordingly? Therefore I cannot see why, if you change your ratio of exchange, you should ship more goods than before?—You have of course put it in your own way and I can only explain it in my own way.

4960. Would you be good enough to show me the flaw in my argument? We start from the proposition that gold prices in India and abroad must move parallel. They must be equal, with the exception of the cost of transport. A certain set of goods at 1s. 6d. will cost in India 100. If the ratio is altered to 1s. 4d., then the same goods will fetch in India, 112·5. If that is so, I should be very glad if you would show me why it should be necessary to export more goods to meet a foreign debt when the exchange is high than when it is low?—Well, I will put it this way to you, Sir. I get an order from a foreign merchant to buy this year 100 bales of cotton, with exchange at 1s. 4d. this year; I get a certain price from that foreign buyer, "buy a hundred bales of cotton for say £1,000." My order is from Liverpool. I get that order, "buy a hundred bales of cotton for £1,000, all charges included." Very well, I calculate and the exchange of the day is 1s. 4d. to-day. Then I find that at 1s. 4d. for that thousand pounds, I get Rs. 15,000. Therefore I tell my seller, "I will give you Rs. 150 for each bale of cotton: do you accept it?" He says, "yes." Now 12 months have passed, and you raise the exchange to 1s. 6d. and the same order is repeated to me, "buy a hundred bales of cotton at £100." I calculate exchange at 1s. 6d. I can only get Rs. 1,325 for it. I tell that seller of cotton, "last year I gave you Rs. 1,500 and you accepted it. This year I am sorry on account of the high rate of exchange I will pay you Rs. 1,325, will you accept it?" Then as I have more cotton that I can use myself, I am forced to accept that price of Rs. 1,325. Am I then a loser or not in taking Rs. 1,325 for that cotton owing to the higher exchange?

4961. I do not quite see where you are the loser. If it is true that prices adjust themselves, then what you have done really is, you have given the cultivator in the first case Rs. 150 per bale, that is right?—Yes.

4962. In the second case you have given him Rs. 135. But with Rs. 135 buying exactly the same amount of goods as the Rs. 150 before, I do not see where the damage arises? We start from the premise that prices adjust themselves; therefore the Rs. 135 which the cultivator gets will buy exactly the same amount of commodities as the Rs. 150? That is correct. Therefore I suppose you will agree that a high or low exchange, provided it is stable, cannot damage anybody within the country?—Nor can the foreign debt charge in terms of goods be any heavier in either case.

4963. That cannot affect the question, because you have to ship exactly the same amount of goods to meet that debt? I take it that is so?—I will not concur in that, so please do not take my answer as yes. I want to think it over.

4964. Would you care to reply now?—I will reply afterwards.

4965. (*Chairman.*) Mr. Dalal says he would rather not answer to-day because he wants to think over the matter?—Yes.*

4966. (*Sir Henry Strakosch.*) One other point is not clear to me. You were saying that the cost of changing the ratio to the Exchequer would be in the neighbourhood of 3 or 4 crores, and you said that you prefer higher taxation rather than screwing that amount out of the people by exchange?—Yes.

4967. Is it right, as I believe you have agreed with the Chairman, that the end effect of changing the ratio would be, on the basis of your assumption, that one section of the community would have to go with a lesser income, for the benefit of another section of the community? Would it not be true to say that if you raise that amount by taxation, it would mean nothing more than to raise from the whole body of the community a certain amount to favour a selected few, namely, the millowner and the exporter?—That is based on an assumption, Sir. I do not see why it should be taken from any one class of people; I say, distribute it over the whole class.

4968. Exactly, but the effect of that would be, would it not, that a selected class of the community would benefit by it, namely, the millowner, and the exporter, and that the other members of the community would to that extent bear a burden which benefits a selected class?—You mean the extra taxation? It depends on how you distribute that taxation, Sir. You may lay it on the millowner, if you think a lower exchange is going to benefit him, you may put a tax on him, you may ask him to pay more income-tax.

* Mr. Dalal's answer given later.—I will give my answer this way, then. If the price of a commodity in London is £10 and exchange is 1s. 4d., the price in India would be Rs. 150 (leaving aside freight and other charges). If the exchange is raised to 1s. 6d. an adjustment takes place and the price drops to Rs. 135. The adjustment is permanent and a permanent lower price to the extent of Rs. 15 is established, and whether prices move up or down in London, the permanent difference of Rs. 15 must remain. India must get Rs. 15 less for the £10 of produce, or sell a correspondingly greater amount of commodities.

4969. But then he is just as badly off as before?—He would willingly agree to that, than agree to this indirect taxation and indirect competition.

4970. With regard to the question of the secrecy of Government remittances: remittances abroad I take are not a thing which is confined to Government? We have to remit abroad money to pay for everything that the country needs?—Yes.

4971. It is true that the Government is a heavy buyer of sterling to meet its charges abroad, but the importer equally has to buy a very substantial amount of exchange?—Yes.

4972. Now I put to you a case; if a big firm of bullion brokers were to acquire a big amount of gold or silver and they wanted for that purpose to remit money abroad, would you advocate that this transaction also should be published? I can conceive of circumstances where a bullion broker might buy ten crores of gold in London which is a very substantial amount compared with the Government remittances. Would you advocate that his transaction also be made public property?—Do you want to put the transaction of a bullion broker and the Government of India remittances on the same level? The one depends upon socrecy for its success and the other not.

4973. They are both buyers of exchange?—What of that? But for different purposes.

4974. I understood you to say that the public at large that deals with foreign countries is damaged by the fact that the size of the transaction is not made public?—Indirectly; because the bankers do not know how they stand in relation to exchange. Therefore they cannot render that service to the trade of the country which they otherwise do.

4975. Should they not then know if a bullion broker were to buy ten crores of gold in London?—They may not know. The whole world would know when the ten crores of gold moved from London.

4976. So would you know when the Government publishes them at periods of certain intervals?—But those are too long periods.

4977. What would you say the period should be?—Every morning, the previous day's operations should be announced.

4978. And the bullion broker would not mind if his transaction became public?—There is no analogy between the bullion broker and the Government of India who control the financo of the country. The very life of finance in India depends on Government sales of councils or purchase of sterling. Without that everything is in the dark; the country cannot move. Why should the country be kept in the dark? There is no reason.

4979. What is the total import trade of India, if I may ask you?—I think about 250 crores.

4980. Let us take it at 300 crores of foreign remittances have to be bought to meet that. The Government remittances are but 30 or 40 crores. Don't you think that the remaining 260 crores are a huge item in the exchange market and that if one individual or one firm were to wish to appeal to the exchange market for a very substantial sum of remittance that would have exactly the same effect upon the market as a purchase by the Government?—You assume too large a figure. No transaction is in ten millions. I would be exceedingly surprised if a transaction in bullion is half a million, I mean in one transaction; and say a bullion broker wants to import half a million worth of gold; on the other hand an exporter wants to sell half a million of bills and the operation goes through the bank, buying and selling, but when there is a balance left and that can only be financed through these Government operations and by keeping those operations in the dark, the whole thing gets upset, particularly when exchange is fluctuating. It won't matter so much when the exchange is fixed.

4981. (*Sir Maneckji Dadabhoy.*) I just like to know with reference to your statement on page 5 about the obligation of Government. You state "The obligation to give gold should not be legally undertaken until a vast amount of gold is accumulated in the currency reserves, but Government should give gold as much as possible and convenieut in the transition period." What amount of gold would you recommend to be accumulated? Can you give some rough idea?—In this memorandum which the Government have prepared, it is 100 millions. I should think that until about 100 crores of gold is collected, I would not venture to give gold. About 100 crores, worth about 75 million pounds.

4982. And would there be any difficulty at the transition stage of collecting that amount of gold?—I do not think so; in ten years you can collect that. I think in ten years you can easily collect that. In one year, last year, we imported about 57 millions worth.

4983. There is no difficulty?—None whatever to my mind.

4984. And in fact you do not think that a large amount of gold will be required for actual circulation?—In the initial stages you will have to give gold coins. But I believe that the knowledge of the people in these currency matters is growing very fast and vast developments have taken place in the last ten years. They are taking gradually to the use of notes. Ten years ago during the cotton season, if you sat opposite the Currency Office here, all the day you would see nothing else but a string of carts loading silver rupees for taking up country. To-day you may sit there from morning to evening but not see one cart. That shows that they have been used to the notes in preference to the silver rupees and the same thing will eventually happen in the case of gold. At first they will want gold; but when their economic and currency knowledge increases, when they know that they can always get gold, they will not want it.

4985. In other words, the mere fact that they could easily get gold, that their note issue is convertible into gold, will prevent them from asking for gold?—Yes; eventually it will.

4986. (*Mr. W. E. Preston.*) Mr. Dalal. As there seems to be a possibility of some slight misunderstanding on the part of members with regard to the acquisition of the gold required for what I may call your purpose it would possibly clear the atmosphere if I were just to say to you that assuming that all the council bills available had been utilised; let me put down a figure, 40 million sterling for a year's requirements and when Government had announced that that 40 million sterling had been completed, and they were not selling any more councils or buying any more sterling from this side, it would simply mean the Exchange banks and others if they want further funds would have to ship gold from London to India?—And silver for sale to the bazar.

4987. And you would give out silver here against that?—No; gold and silver.

4988. But you would have no coin to give? In the beginning you would have to give local currency notes or silver; it could only be at somo later date when you have got a mint going on and you get sufficient gold to produce the coins and even then of what value would the coins be to us unless they were freely moved about in circulation and were not hoarded? Otherwise, your system has been defeated.—Let me catch your point. You are afraid that when gold is brought out it won't go into circulation?

4989. Supposing to-morrow Government were to say "we draw the line. No more councils available and we have big demands here for cotton receipts coming on." For any further currency which we may require we would have to ship out gold from London. You would have to give us currency notes or silver here against the gold we are tendering?—Yes.

4990. Taking a hypothetical figure of about 100 million gold to constitute your fund, you would go on each year building up amounts of gold which we send out until that 100 million was acquired?—Yes.

4991. And would you think, therefore, that, after the period of accumulation of gold, ten years hence, you might then begin to add up the pros and cons and see whether the time was not then ripe for introducing a gold standard in its entirety?—To undertake the full obligation you mean?

4992. Yes?—Yes, I would.

4993. I am looking at it from this point of view, that the utmost obtainable might be 10 million sterling each year?—I would take an average.

4994. Not more than 10 years. Would you agree to that?—It may be 15; it depends upon the season. You would get that gold in ten years.

4995. Supposing we get 15 millions each year for ten years. That will come to 150 millions; and beyond that 15 millions no further gold would be required under your scheme?—For the Government currency purpose; but the country will want more for its own purpose, i.e. for the arts, etc.

4996. The country will want more, yes, but now we are only dealing with currency?—Yes.

4997. (*Sir Norcot Warren.*) Regarding Government remittances, are you in favour of purchase of sterling in India or selling of council bills in London or a combination of both systems?—I think if the exchange is once fixed, the sale of council bills is the better system; not particularly in London; instead of selling council bills Government should make a public purchase of sterling in India.

4998. I want to know whether you are in favour of sale of council bills in London or purchase of sterling in India?—I am in favour of purchase of sterling in India.

4999. In preference to the council bills?—Yes; it must be public.

5000. By tender?—Yes.

5001. (*Chairman.*) There was a question I wanted to ask which slipped my memory. It is in relation to the striking statement which you make under the heading "questions 1 and 2," paragraph 4, where you say that foreign imports have increased as a result of the rise in exchange. When I refer to the figures in that connection I do not quite apprehend what you intend by that statement, because on looking at the official figures of imports, I see that the exchange began to rise, if I remember right, in July 1921, and if I look at the official figures of imports, I see the imports for 1920-21 were 335 crores and for 1924-25 they were 243 crores. If one allows, say, 15 per cent. for the increase in value, we still get 278. So that from the course of the figures it does not seem that that there has been any very great stimulation of imports?—Where is that, Sir? Which year do you mean, Sir?

5002. In Appendix II. The critical year is the year in which the course of exchange varied, July 1921. I was then looking at the course of the figures, at the same time making a rough and ready allowance for the rise in value. It was 266 crores in 1921-22 and 243 last year?—I have made a statement here.

5003. I was not sure what you intended?—Let me make it clear to you, Sir. The figure is practically the same; but the effect has been a great deal more in this way that we have imported an enormous quantity of gold in 1924-25, and a very large quantity in 1923-24. Taking into consideration the large quantities of bullion purchased by the people by which their purchasing power was reduced for other commodities, these imports are very heavy. Therefore, they gave a check to the manufacturing industries of the country. That is what I am driving at.

5004. It was not so much the actual increase in the imports of commodities?—No; but practically it becomes the same.

5005. As it were the purchasing power of the people was diverted to gold?—Yes; the remaining purchasing power was divided between these imports and the products of indigenous industries.

5006. There only being this difference, that relatively gold did not enter into competition with any of the internal industries of the country?—Yes it did; if people buy gold they won't buy cloth

The Chairman thanked the witness on behalf of the Commission and the witness withdrew.

(*Adjourned for lunch.*)

Sir VICTOR SASSOON, representing the Bombay Millowners' Association, called and examined.

5007. (*Chairman.*) Sir Victor Sassoon, you have come to assist the Commission on behalf of the Bombay Millowners' Association and you are accompanied by the Secretary of the Association?—I have got the Secretary and also another member of the Association who is more conversant with the technical side, Mr. Stones, who is also a member of the Committee.

5008. The Bombay Millowners' Association is an association of the owners of cotton mills?—The word "owners" is rather a misnomer. We are more the managing agents of mills. It dates from the time when most of the mills were proprietary, but I don't suppose there is a single agent now who owns the mill he manages.

5009. For the benefit of the members of the Commission, who may possibly not be familiar with the organisation of business in Bombay, will you tell us what the typical work of the managing agent is to the industry?—Shortly, the managing agent is a firm who takes the place of a whole time servant usually styled Managing Director at Home. The Managing Agent is not, however, a whole time servant but acts for a number of companies as a rule, besides carrying on his own business, generally that of a merchant. The practice dates from the time that suitable men were very much sought after, and has the additional convenience of at any rate one partner being on the spot to carry on the work while the other is on leave. But besides carrying out the executive functions of a managing director, a firm of managing agents is largely responsible for arranging any finance required by the concerns they manage and to do this have to pledge their own credit. This is probably their most valuable function to-day and the reason why they have not been superseded by whole time managing directors.

5010. We have the benefit of a memorandum* from Mr. Maloney, the Secretary of the Millowners' Association, which sets forth in some detail the proposals and recommendations of your Association, and I will proceed if I may to ask you some questions to elucidate the nature of your proposals and to ascertain the weight of emphasis which you place upon them?—If I may interrupt for a moment, Sir, what my Association have allowed me to say in coming before you is that we do not pretend to be experts in currency; we obviously view the matter from a rather domestic point of view, but at the same time certain members of the committee thought that they would like to amplify, if you notice, what we call suggestions; but really what we wish to emphasise is what affects us more closely, that is to say, the effect of an appreciated rupee to-day and the effect of a gold currency. That is what affects us more closely; the rest are merely suggestions, and I do not suppose I shall be able to give you opinions which would rank as weighty as those of the experts you have had before you.

5011. I should naturally suppose it would a misapprehension to conclude from what you have said that your proposals refer only to the interests of the Millowners' Association; I should rather suppose that your proposals are put forward on the ground of general public interest?—On the ground of general public interest certainly, Sir; but at the same time shall we say more from the business man's knowledge rather than from a currency expert's knowledge. I mean we have certain views which you may call commonsense views held by business people; but certainly my knowledge as to the details of some of these technical questions is by no means extensive, and I should not perhaps be in a position to reply as to

* Appendix No. 25.

certain causes and effects if it concerned the very highly technical part of currency questions.

5012. We are to look upon your proposals in the sense that you are only prepared on behalf of the Millowners' Association to deal with these matters in so far as they affect the practical interests with which you are acquainted?—And also, shall we say, a layman and not as an expert; it is chiefly that side I want to emphasise; I do not pretend to be an expert at all or to have expert knowledge.

5013. I think we shall probably all agree that knowledge which is based upon practical experience is the only knowledge to which very much attention should be paid in such matters. You say: "They further consider that the two main essentials for the permanent solution of the currency problems are:—The introduction of a true Gold Standard in India with the value of the rupee fixed at a rate which will correspond with countries where currency has returned to its normal value." You continue: "With the rupee exchange at the present rate 100 United States of America gold dollars are worth Rs. 272·4 as against Rs. 307·8 in January, 1914. From this it would seem that the present value of the rupee is far too high unless the Government of India are in a position to show that the United States of America has a depreciated currency." That leaves some little doubt in my mind, and the doubt is this: too high in relation to what?—In relation to the gold dollar.

5014. What standard are you referring to in the relation of the rupee to the dollar?—We are taking the standard which was in existence before the War, what you might call the par values which were in existence for a number of years in this country and for a large number of years in others, and we are comparing the position to-day as far as India is concerned with a country like the United States which is commonly supposed to be very prosperous and to have come out from the effects of the War better than most other countries of the world. It appears illogical that the United States should have a depreciated exchange as compared with India compared with the pre-War values.

5015. Of course, it is apparent that the present value of the rupee is higher in relation to the dollar than it was, but it seems to need greater clearness as to whether it is necessary to proceed from the obvious circumstance that it is higher to the further conclusion that it is too high. Do you mean that in relation to Indian prices the rupee is overvalued in the external value?—We were rather looking at it from the point of view of our external relationships in our competition in the world markets, the competition that India has to fight from an industrial point of view. We take the example of the United States, because, although we are not as advanced industrially as they are, we, in common with them, are large exporters of produce. Further, we note that the United States does not appear to be in favour of having an appreciated exchange, and have been helping the pound sterling to regain its par value, and to keep it. This was confirmed to me by my banker friends in New York on my visit there last summer.

5016. Is it then your opinion, or is it not, that the rupee is still overvalued as regards its external value in the sense that there has still got to be a substantial readjustment of internal prices in India in order to produce an equivalent of the internal and external value of the rupee?—As far as internal prices are concerned, there is no doubt that cereals and pulses, which are the products of the large bulk of the agricultural worker, are much below prices they should be at if you take into consideration the rise in cost of living and if you take into consideration the rise in wages and salaries that have taken place in towns and in industries in India. That is, talking generally, if we take the particular point of wages in industrial concerns like our own, we find ourselves in the position that the pre-war par was reached, I think, somewhere about last September. The present 1s. 6d. rate was only reached, I think, in March of this year. Our industries and the industries of this side of India—I am leaving out the Eastern side where they have got special conditions—have not been flourishing during the last 15 months, and we find ourselves in the position that, through the rise in the gold value of the rupee, our labour is being paid 12½ per cent. more from the world point of view than it was before, although you cannot tell a mill hand that his wages are 12½ per cent. more because he is only thinking in rupees. And this high exchange is also hitting us as regards all our fixed charges which we cannot get away from. It is not only hurting us seriously as regards our trying to export our finished article; it is also hurting us internally because it acts as an advantage to competitive imports as well; and, therefore, if we were merely to go back to the position we were in 15 months ago as regards charges we would have to reduce salaries and wages, which are the only things we could reduce, by something like 13 per cent.

5017. I do not quite follow that last figure?—If we are to be in the same position as we were 15 months ago, when the gold value of exchange was 1s. 4d., as regards competing with the world in India alone, we should have not only to reduce salaries and wages by 12 per cent., but by an extra half per cent., to make up for the increase in gold values that we have to pay on rates and taxes, insurance and similar items which we cannot control. It is always said these matters adjust themselves. It is very difficult in India to adjust wages, and I take it that even the Government must find it difficult, because I have not heard that there is any suggestion that the Government salaries and wages should be reduced by 12½ per cent. owing to the appreciation during the last 15 months.

5018. What has been the general tendency of wages in the cotton industry in Bombay over a considerable period, shall we say, for the last 25 years?—They have always been upward, of course; we have got a nominal 70 per cent. increase in wages since the war; actually, if you take the pre-war figure as 100, the wage would be 231, while the rise in all commodities (I am taking these figures from the Indian Trade Journal of the 12th November) would be 60 per cent. or figures of 160.

5019. You have given us some very helpful figures compared with the pre-war period. Your general reply would be that, for the preceding period, the figure would be upwards?—It would not be downwards.

5020. What has been the tendency of wages since the actual movement in the general level of world prices, since about the middle of 1921?—We have had no cuts at all; the wages have not altered; to-day they are getting the same wages as they were receiving, they still receive the peak; other countries have had cuts since the war, we have not.

5021. In view of those circumstances, that there was a general rise in wages which appears to have ceased in 1921, I want to ask your opinion upon a contention which might be advanced from another point of view, that is, that although the rise in exchange has not been off-set by any reduction in money wages, it has in fact been off-set by the prevention of the regular increase, and thus an adjustment has taken place, although the adjustment is masked by the general tendency of wages in Bombay to rise?—That, of course, is rather a difficult question to answer; we can obviously show you how the average cost has dropped from 179 to 160, I mean the average cost in all commodities, since September last year; I take that date because our exchange was then about 1s. 4d. gold.

5022. That is the general index number of prices of commodities?—Yes; but the great trouble is that there is a considerable amount of masking there—I mean it is very difficult to answer, because world prices obviously do affect our own prices here; you cannot get away from that, especially when you are dealing in world commodities, such as wheat and linseed and such like; but I do not think that, although, admittedly, they are bound to be affected, the one balances the other. In my mind, although it may have masked a possible rise——

5023. Let me put it to you in quite a crude way in order to make it clear that our minds are at one. Wages suddenly began rising; then exchange began to rise; at that point wages stopped rising, and that was, as a matter of fact, effected by the adjustment resulting from the rise in exchange making itself felt upon wages?—I did not follow that; that is quite easy. In other words, your point is that if it had not been for the rise in exchange wages would have risen since last September. That is much simpler. I can say "no," because (I am talking since September, 1924) there had been no rise in wages for some period before that.

5024. I am taking from July, 1921, which is the point at which exchange began to rise?—We are not complaining about any rise in exchange up to the 1s. 4d. gold which took place about September, 1924. I do not think, as far as our industries are concerned, that, even had exchange remained where it was, that there would have been a further rise in wages during the last year.

5025. That is an important relevant consideration which you have now advanced. What are the grounds for your opinion that there would have been no further rise in wages, even if exchange had not changed?—Because owing to certain world conditions the industry was not in the healthy position in which it had been when the extra wages were given. It is obvious that workers ask for an increase only when the industry prospers.

5026. Is that obviously the case always?—In India I think that you can take it that when labour sees an industry prosperous, as during the boom years, it is supported in its demand by public opinion; on the other hand, when the industry is not holding its own the question that confronts your labourer is not whether he can get a further rise, but whether he can keep what he has got, especially when wages in similar industries abroad have fallen and his has not, for it must be remembered that both Lancashire and America have made wage cuts from their top. I think that the psychological effect that other countries had made cuts and we had not would have prevented any serious demand for a wage increase during the period you mention.

5027. You would then attribute the cessation in the rise of wages rather to the psychological effect than to any change in the cost of living?—Yes; I am quite certain of one thing that the rise in the rates of wages of the millhands, being, as it was, 240, was much higher than the highest commodity rise; let us take the highest that I have got here on this sheet; in 1921 the average commodity value was 181; it was lower than 1920, when it was 204; in 1922 it was 180, and in 1923 it was 176; in 1924 it was 177. These are general index numbers. So there was nothing from the point of view of rise in cost of living to have justified a rise in wages, when they were getting 230.

5028. That must be the Calcutta general index number?—Yes.

5029. Do you think the Calcutta index number throws very much light on the cost of living? Should it not rather be in the form of a budget of a wage-earning household?—To be very frank, I always view all these cost of living figures with great suspicion.

5030. I quite appreciate the force of your reply; but, apart from that, does even a highly scientifically based and calculated index number of general commodity prices throw very much light upon the cost of living index?—It gives you the trend of prices, even if you do not take the actual average; when I look at it I rather look at cereals, sugar and the more obvious things that we know the labouring man takes.

5031. The point is this, that the rate, on the average, must be so very different for the budget of the working class household, where you have got the constituents composed mostly of lentils and so on, that you run the risk of getting a very misleading figure?—I quite agree, but as far as we are concerned here we do know from practical observation that the rise in wages of our mill hands is more than the rise in the cost of living. It is proved by the way they are spending their money. They are buying luxuries they could not afford before. I am even now taking a census in my mills of the number of men who are wearing imported cloth costing 30 per cent. more than what we sell them, because we always let them have our cloth at reduced prices; in the old days they could not afford to buy the imported kind. Then, again, the demand for money orders to the districts from which these men come has increased tremendously, and that demand is still keeping up. You may take it that they are much better off than they were in pre-war days.

5032. Your opinion is that there has been a steady and substantial increase in the real wages, and, in consequence, an increase in the standard of living?—No, Sir; the increase has not been in the standard of living; the increase has been in the purchase of luxuries, in drink; instead of drinking country liquor the workman now likes to drink a bottle of wine with a foreign name on the outside; some of them have been sending money to their homes; those people no doubt have obviously increased their standard of living when they return home; but there has been a good deal of ——

5033. You are referring more to the moral aspect of it?—I would call an increase in the standard of living, living in a better room, or having fewer people in the existing rooms, but they do not do that; they still live huddled up as they did; they will eat more, and drink more and enjoy themselves more now; but if you take some of their money away they will only have to do without their luxuries, for their overheads, such as rent, have not gone up.

5034. The increase in the rate of wages has resulted in an increase in expenditure on luxuries?—Expenditure which is not necessary.

5035. I wanted to follow out whether, as a consequence of that, you are recommending that it would be inadvisable to stabilise the rupee at a higher value than 1s. 4d. gold?—That is from the point of view of fluctuations.

5036. Let me generalise the question: I understand your general recommendation is that the rupee should be stabilised at 1s. 4d.?—We think that it would be a point which you can stabilise it at owing to the experience of the past; whereas we do not consider that it can be stabilised at 1s. 6d.

5037. Is the basis of your recommendation because it can be stabilised at 1s. 4d. and cannot be at 1s. 6d. or is the basis of your recommendation the advantages that would be conferred upon India or any part of the Indian community by the selection of the 1s. 4d. rate?—Our main point is that the 1s. 4d. rate is to the advantage of India as a whole and to the large majority of the inhabitants of India. Our second point is rather taking the point of view of the merchant who says: "Let us have a stable exchange; if you give us a stable exchange I do not mind what the rate is." The first point is the reason why we are really fighting for this 1s. 4d. But we say that, if you are talking to a merchant who does not mind whether the rate is 1s. 4d. or 1s. 6d. so long as he is able to buy the goods and he can trade (and I, too, am a merchant, and I am speaking from practical experience) but who does want a stable rate, you will get it with 1s. 4d. more easily than with 1s. 6d.

5038. Dealing with the first aspect, namely, the positive advantage that the 1s. 4d. rate might confer on the Indian community as a whole and on various sections of the Indian community, carrying out your original suggestion, it would be useful, I think, if I were to ask you as to the effect this would have on the particular interests with which your association is concerned. What would be the effect upon the business interests with which your association is particularly connected of the reduction of the rate to 1s. 4d.?—At the present moment, as you know, Sir, the excise has been removed, and therefore this would obviously appear to be a distinct advantage to the mill industry, not necessarily from the point of view that they are going to make more, but that they can sell at a lower price by its removal. I have worked

out the difference between the present 1s. 6d. rate and 1s. 4d. rate as a very little less than the excise. So to-day, with the excise removed, all we are getting is, I think, a ·03 per cent. advantage over what we would have had if the excise had been left on and we had our 1s. 4d. gold as we had last year. I am afraid I have not been clear?

5039. As I follow your reply, it is that whatever bad effect was produced by the rise to 1s. 6d. is substantially counteracted by the removal of the excise?—Although it is generally considered that we must have benefited by the removal of the excise, that is not the case; it is merely giving us back what was taken from us before by the rise in exchange.

5040. There is a minus to set against that plus?—And the position to-day is that from what we can see of trade generally, the mill-industry as a whole will not be able to work at a profit during the coming year, in spite of having got the excise removed.

5041. You are assuming in your reply (I don't say whether rightly or wrongly) that the reduction of the rate to 1s. 4d. would confer some benefit upon the cotton industry. What I wanted to ascertain was what benefit that would be and how it would act?—I think in the first place, it would mean a reduction of 12 per cent. in wages, which would not be made up by a rise in wages. I don't think, speaking generally, that if you went back to 1s. 4d. there would be any consequent rise in wages, certainly not in our industry and not for a large part of India. I think it would probably lead to higher prices for certain produce like cereals and pulses, and we, as mill-owners, would welcome that because, although the cost of living might be increased slightly in consequence, more money would be going to our purchasers who would have more to spend. The trouble which we find is that our customers, who are the poorest people, the agricultural people in India, have, in spite of five good monsoons, not been able to buy as much of our products as might be expected; and although, as I have admitted, these index numbers are often misloading, I think the fact that you have only got 135 as the figure for cereals, and 241 for cotton manufactures, can be taken as fair support of what I have been saying. We think that if the index numbers of cereals and pulses approach more nearly to the general average and more particularly nearer to the figure for cotton goods, the ryot would have more money to spend on our products.

5042. Let us follow that up a little. The mill-owner's position would be improved because, on the fall in exchange, he would get more rupees for his foreign currency for which he sells his exports?—Yes, it would help us in our exports.

5043. The importer, on the other hand, would have to pay more rupees for whatever he imports, in order to lay down the same foreign credit as he paid for these imports. That would result in a rise in the price of imported goods?—Which, Sir, are not, or a very infinitesimal portion of which is in our opinion bought by these poor classes with which we are dealing.

5044. Laying that point aside for a moment, let me ask to what extent does the cost of production, if at all, in your cotton mills depend upon imported goods?—The replacement of machinery—I am not taking the main machinery because that is already there—replacement of machinery and stores . . . . let me see, for yarn it is 1½ per cent., for cloth weaving it is 5·7 per cent.

5045. That makes a total of round about 7 per cent.?—No, the yarn is included in the other figure. If you take it on the finished cloth, it is 5·7.

5046. Your reply is that the proportion of the cost of production which is affected by the price of imports is round about 5 per cent.?—Between 5 and 6; say 6 per cent. to be on the safe side.

5047. Now, take the other great constituent in the cost of production, wages. You have expressed the opinion that the cost of living depends very much upon the cost of those foodstuffs produced and consumed in India?—These cereals.

5048. Yes. In your opinion would the rise in the price of imported foodstuffs have no reaction at all upon the internal prices in India of those articles?—Sugar, of course, is a separate commodity. Even then they have got their unrefined sugar, they could use that for the poor. But most of the imported foodstuffs are imported for the Europeans. I don't think they compete with your ryot at all or your mill hand. His rice, his cereals, there are no imports of these, or of anything that could compete with these.

5049. Let us take it from another point of view which may perhaps make clearer the series of contentions which, in order to apprehend your views, I am venturing to put for your opinion. Supposing the rate were to be fixed at 1s. 4d., by what methods as regards the currency of the country would the change be effected?—There my association have allowed me to suggest that we should not be dogmatic, as we are not currency experts, as to how it should be done. We only know that it has only risen from 1s. 4d. to 1s. 6d. exchange in the last fifteen months, and we are convinced that a return to the 1s. 4d. rate would not cause a national crisis or anything of that sort. As for the actual methods, as to how it should be done, whether quickly or spread over a period, our point of view is that it is for the expert to point out the best way.

5050. So that perhaps I ought to venture to lead you a little more. Would it be an answer, were it to be put to us, to say that just as a rise to 1s. 6d. has been brought about by a restriction of the currency and by various methods that have been explained to us, so a fall to 1s. 4d. would be brought about by an increase of the currency, and by a reversal of the methods previously employed to restrict the currency?—Well, Sir, if your point is how a fall should be effected, I think that two bad monsoons will certainly give you that fall without the necessity for inflating (if you want the word) currency. Our point is that it is only through the occurrence of five consecutive good monsoons that the 1s. 6d. gold rate has been got. That is a record, and the chances are that we will have a series of bad or only partially good monsoons, which would automatically bring your rupee down without any need of increasing the currency.

5051. Now to bring you to a point upon which the Commission would be glad to have your opinion, may I ask you to make an assumption that the 1s. 4d. rate is attained by a reversal of the methods by which we are told that the 1s. 6d. rate was attained, that is, by some letting out of currency?—May I also assume, Sir, that that currency is to be let out against gold delivered to the currency office, or is it to be merely a pure inflation with no backing to it?

5052. That is really not the question. If the transition within a reasonable time is to be attained to 1s. 4d., can it be attained otherwise than by an increase in the purchasing medium in proportion to the things to be purchased?—I think, Sir, that it is purely a question of whether you allow your gold to be imported or converted into currency. If the Government chose to say to-day, in practice we are making a 1s. 6d. gold imported point, that is how it is being worked, whatever the reason may be—if you chose to say that for the next three months we are going to make it 1s. 5¾d. and then afterwards 1s. 5d., and then gradually bring it down by stages—there may be a disadvantage. As I say, we are not experts from that point of view. What we know is that the moment it gets normally to 1s. 4d. we should get the 1s. 4d. rate fixed, but you are likely to get there within two years automatically.

5053. I will ask you a question about that, if I may, in a moment. I gather, then, it is your opinion that reversion to 1s. 4d. can be attained without any increase in the cost of living in the country?—I don't say that, Sir, but I say that any increase in the cost of living would not be anything like the 12½ per cent. difference between the two currencies. It would be a much smaller one.

5054. Supposing there is an increase of even that small amount in the cost of living, would it be possible to resist a demand for increase in wages?—From the mill hands' point of view, yes, because they have already got so big an increase that it would be infinitesimal, they would not feel it.

5055. Let me put to you a final point which might be put by a critic. In so far as there is any increase in the cost of living, and in view of the circumstance that you do not contemplate any rise in wages as a result of the change, what would you say to the suggestion that, under those circumstances and to that extent, the extent to which there was a rise in the cost of living, the benefit was being obtained by the cotton mill industry and the cotton industry at the expense of the interests of the wage earner in the industry?—That could be said. Of course, the answer would probably be, you have got so much more than any possible rise in cost of living. You have had no drop at all since the peak, which has not been the case in any other country. Of course, if the industry could stand higher wages, it would probably pay, but I do not think that the industry would be over-prosperous even with this. It is a question of letting it live. I am assuming now that the advantage the industry gets would merely enable it to make some sort of profit, to pay its depreciation charges and so on instead of as at present letting it run at a loss, and I am assuming it could be said that labour was losing to the extent of a small rise in the cost of living. But, on the other hand, it might pay labour to have a smaller real wage, to a very slight extent, rather than have the mills closing down, in which case they would have no wages at all.

5056. But, generally speaking, if we considered the results of this change over a substantial period of time, is it, or is it not, your opinion that, as a result of readjustments following upon the change of internal prices and internal wages, the benefit conferred upon the cotton industry might prove to be only a temporary one which would exhaust itself after those adjustments have taken place?—No, Sir. Since labour has been getting these high wages, one of its little luxuries has been an increase in the absenteeism. They have not been working as regularly as before, and there is no reason why a man should not take away just as good wages as he has to-day by merely being a little more regular. Since the hours of work have gone down, absenteeism has increased enormously; and one of their reasons is this. "If we have got the money, spend it." We maintain that labour has only got to work satisfactorily as it used to work before to be able to get the wages they are getting to-day without any increase in the cost of production.

5057. I am aware that it would be an irritating contention, but might not a critic contend that, as a matter of fact, this permanent benefit was being obtained at the expense of labour by robbing him of one of his favourite luxuries, the luxury of absenteeism?—When you are dealing with a manufacturing industry like the mill industry, I am sure that the mill hand in Lancashire and America would not welcome any cuts in his wages, but he has had to have them, and he has realised that when the industry is doing badly, he has got to bear his share of the burden. In this case, I quite agree if your cost of living is going up even by ·0001 per cent. and you are giving no rise in wages, it is perfectly true that the labourer is suffering to that extent; but I might also say that during the last year his wages have gone up 12½ per cent. I am perfectly sure his cost of living has not gone up, it has gone down instead, and we have not got any of that back, so he would really be going back to where he was a year ago, or fifteen months ago. We are really taking something which he did not expect that he was going to get.

5058. If we had a labour leader here arguing against your point of view, he might add this to the reply that "it appears to me that the permanent benefit which you expect to the cotton industry is to be obtained not really as a result of a fall in exchange but as a result of labour putting up with rather less wages and working harder"?—"Less wages" *or* "harder work," isn't it, Sir? If they work harder, they are going to get exactly what they had.

5059. Very well, "or"; I accept your correction. Would there be anything in that contention?—Only if a labour leader were going to assume that any advantage which came fortuitously was not to be taken away; I maintain that this rise in wages within the last fifteen months was not asked for by labour at all; they just got it. We are taking away something that they got by luck and never expected. Labour never expected fifteen months ago that they were going to get a rise in wages, or that the industry justified it. I do not think that even a labour leader would urge that. If he did, he might ask for 1s. 8d. exchange. One thing is certain, that either something of this sort would have to take place or they will still have to forego this 12½ per cent. and have that cut in wages; otherwise we cannot live. This year we have just got our figures, they are confidential, but I may give them to you—the industry has lost two crores of rupees; and no industry can keep on at that rate of loss.

5060. The point I wanted to ascertain was whether these fundamental difficulties in the situation would receive any permanent alleviation from the change in the rate, or whether the alleviation would only be temporary?—I think that it would be permanent, because, as I said, the rise they have got is unexpected.

5061. Turning to the other aspect of the recommendation in favour of the 1s. 4d. ratio, it is your opinion that a 1s. 6d. rate is more difficult to maintain than a 1s. 4d. rate? You say that "if the value of the rupee was fixed at 1s. 6d. gold, my Committee believe that in the event of two successive failures of the monsoon it would be found impossible to maintain its parity." If we assume any scientific system as a basis for the currency of the country which provides for the automatic contraction of the currency when there is a heavy demand for foreign currencies to cover foreign payments, why does your Committee think that there is anything more difficult in the maintenance of the rate at the higher stable figure than at the lower stable figure?—The same reasons, Sir, for which it would be more easy to keep it stable at 1s. 6d. than at two shillings.

5062. That is just the question. Would it?—It has been shown that it has not been possible to keep it at two shillings. It has been shown in the past that it has been possible to keep it at 1s. 4d. We have got our record of the past to show that you cannot keep it stable at 2s. but can keep it stable at 1s. 4d.

5063. Must you not try to distinguish between the difficulties of achieving a higher rate in comparison with that which prevails at a given moment, and the difficulty of maintaining that rate after there has been a period of adjustment during which prices and so on have accommodated themselves to the new rate —I am assuming as between two stable rates?—You are not assuming that prices have adjusted themselves to 1s. 6d. gold exchange?

5064. I am making here two assumptions for the purposes of a comparison. On the one hand I am assuming a 1s. 6d. gold ratio to which prices have adjusted themselves, and on the other hand a 1s. 4d. gold rate to which prices have adjusted themselves, and I want to ascertain why it is easier to maintain the lower rate than the higher rate?—I think, Sir, as the point is to maintain the rate when the tendency is for it to drop, it is obviously easier to maintain a lower rate than a higher rate.

5065. It is not perfectly obvious to me why?—But it would appear, Sir, in practice—I am not an expert—in practice we do know that 1s. 4d. has been maintained, and we are maintaining that if you have 1s. 6d. gold since last March, and if prices could adapt themselves so quickly to 1s. 6d. exchange—it has been below 1s. 6d. and only reached 1s. 4d. gold last September—a 1s. 4d. rate cannot be any great hardship, and we cannot see why there should be any reason to choose 1s. 6d., which is more or less a new six-monthly rate.

5066. You refer to the failure to maintain the two-shilling rate. Should we not reflect that, at the time the effort was made to maintain the two-shilling rate, there was no provision for the automatic contraction of currency, and would it not be a justifiable opinion that the reason why there was a failure to maintain the two-shilling rate was in fact because currency was not automatically contracted during the sale of reverse Council Bills? On the contrary, there was no contraction of currency, and does not that suggest that if you have got a system which provides for the automatic contraction of currency, once prices have adjusted themselves to one rate it is as easy to maintain the one as the other?—Now, Sir, you are asking me a hypothetical question and I am not technical enough to know.

5067. The practical part of the question was whether the failure to maintain the two-shilling rate was not really due to the failure to contract the currency?—We do know that as merchants we consider that it is not going to be beneficial to the country to contract the currency more than is absolutely necessary, and our point rather is, why choose the 1s. 6d. gold? What is there magical about the 1s. 6d. gold. And we say, why choose the 1s. 6d. gold? It has not been 1s. 6d. gold at any period that we know of. The two-shilling rate had one advantage, that it has existed in the dim past, but it never has been 1s. 6d. What is the advantage?

5068. I should put the contention which has to be met in this way, that there is nothing magical about 1s. 6d., just as in the same way as there is nothing magical about 1s. 4d.; that the only big characteristic about 1s. 6d. is that it is the existing rate to which prices have substantially adjusted themselves, and that any variations from that rate would involve disturbances. Therefore the argument in favour of the 1s. 6d. rate which is put before us is not that it has any positive advantages, but that it has the negative advantage of avoiding any disturbance?—May I say that if you had been called here a little over a year ago, when the 1s. 4d. rate was in force, then it would have been said that as it was the rate at the time it was a good rate.

5069. These contentions to which I have referred apply with equal force to the 1s. 4d. rate, with the single reservation that the 1s. 4d. rate had prevailed long enough to allow for substantial adjustment of prices?—I maintain that the 1s. 4d. rate existed a great deal longer than 1s. 6d. rate has existed. I think that any adjustments that would have taken place with 1s. 6d. rate must have taken place since last March, which is a very short time, and I think that considering that you have 1s. 4d. so long, that it has really been in existence since the war, and the 1s. 6d. in our view has only been made possible without artificial support because of your five good monsoons, which is a record, it is advisable to take a rate which is normal and suitable to the fineness of the gold sovereign. It has been in existence for a long time, the rate at which this country laid down a good deal of machinery. The bulk has been laid down at 1s. 4d.; 1s. 6d. is an entirely new rate. It might be that some machinery has been laid down at over 2s., but I don't think much, and the bulk of it has certainly been laid at 1s. 4d.

5070. Of course, the advocates of this contention to which I have referred would, I imagine, say that the question is not whether once upon a time prices were adjusted to some other rate, but whether they are now adjusted to the present rate, and I rather gather that your replies are based upon the fact that prices are not now adjusted to the 1s. 6d. rate?—I do not say they are not; but I do say that if they are adjusted, the adjustment has taken place, between March and now. If you went back to 1s. 4d., they would readjust themselves with equal simplicity and without any more trouble.

5071. That makes it necessary for us to consider what that equal simplicity was. Your contention, as I understand, would be that the adjustment to 1s. 6d. could only be attained at the cost of very great disturbance to the various interests in the country?—I maintain that the Government is going to lose a great deal in taxation and that a large protective measure will have to be probably passed, protective measures for certain industries. I have got one little point which may help you. The Tata's steel as a protection of something like Rs. 12 a ton. I am told that the difference in exchange between 1s. 4d. and 1s. 6d. works out at Rs. 20 a ton. So the Government will cause a great deal of trouble to themselves by having this new 1s. 6d. rate, whereas if they went back to 1s. 4d. they will probably find that a number of industries which now want protection will not need it, or they can justifiably refuse it. That is a point in favour of going back to the last year's rate.

5072. If I may pass from that to the recommendations of your Association as regards the basis of the currency system, do you prefer the English sovereign or an Indian coin for legal tender?—As far as my association is concerned, I think they would like an English sovereign to be a legal tender; but I think they would probably also like an Indian coin of the same value.

5073. You would see no inconvenience in having two coins circulating?—I do not think that there will be any more inconvenience than an English sovereign and an Australian sovereign circulating.

5074. Does the Australian sovereign circulate in India?—No, but in Australia they take English sovereigns.

5075. Assuming thero is no difficulty in getting the English sovereign into circulation by suitable arrangements, I want to know whether you have any objection to the simultaneous circulation of an English sovereign and an Indian mohur? I rather thought it was your opinion that you would have both?—I think they rely on English sovereigns to circulate. I do not think that my committee looked at it from this point of view. I do not think my committee has any particular view one way or the other.

5076. Then you recommend that gold certificates should be issued on tho basis of Rs. 15 to the sovereign against gold held in reserve in India. Anybody who brings gold will get gold?—In that connection I may say that my own personal view is not quite that of my committee. I am not so much in favour of it, I do not consider it so essential that there should be gold currency as long as they have got the note, which is fully covered by gold. But taking it from the point of view of my committee, they consider that for a few years all tho gold tendered should be taken and not necessarily gold in sovereigns, but notes against this gold should be issued. They think that in that time you would get a ratio of tho metal held to the total amount of notes in circulation and the silver rupees in circulation, which would compare very favourably with the Bank of England at the present time.

5077. The accumulation of sufficient gold, to meet the obligation of converting outstanding rupees into gold, would no doubt involve the accumulation of a very large amount of gold in the reserves?—The extra gold for present rupees?

5078. Yes. If you are contemplating undertaking the liability to convert rupees into gold at some future time, that would require the accumulation of large gold reserves?—On the same parity as in England.

5079. I do not follow?—You will have to have reserve of metal to the same percentage of the note issue.

5080. You contemplate only a percentage, approximately equal to that of any currency system?—I think we ought probably to have more. I think even to-day they have got more. I worked it out, I may be wrong; I looked into the "Economist" just now, and I find that the Bank of England has a 35 per cent. margin, whereas India to-day, on the assumption that your silver rupees are worth 8 annas only in bullion, has a 58 per cent. margin.

5081. That may be so. What I want to know is what your ultimate idea is. Is it your ultimate idea that the rupee should cease to be legal tender and should be replaced by the sovereign, by the gold coin?—I think that eventually, and here my committee realise that it is very difficult for us to say when it should be, but it should be the ultimate aim of Government to limit the number of rupees which should be legal tender.

5082. Can that be done unless you have as a preliminary measure undertaken to convert outstanding rupees into gold, rupees either in circulation or kept in hoards or other forms as stores of value? Otherwise they might complain that the limitation of legal tender had seriously affected the value of their hoards, and that they had not been given the opportunity of substituting for them some more satisfactory medium?—As long as the silver content of the rupee is not worth less than what is now, they would not be worse off.

5083. Supposing I hold 1,00,000 rupees in my hoard and the Government suddenly comes along with a declaration that these are no longer legal tender?—More than a certain number?

5084. More than, say, 50 or 100 or any number. Will that not seriously affect the value of my stores of value, because I cannot use them any longer?—You can go on changing the fifties. You can change for notes slowly.

5085. I am assuming that if you are holding a lakh of rupees you may not think that you will be feeling secure?—Yes; though they know that the rupee is a token coin, they feel happier with the silver than with a note. Only it is a question of time.

5086. Would you not admit that there would be a necessity for an intermediary period during which the rupees outstanding might be changed into gold?—No; if you do not make any more rupees, the increased requirements of the country for single rupee currency would probably take care of that, and you must remember that if all the new currencies are backed by gold your percentage of gold to your total would be even higher. To-day it is 33 per cent., if you merely take the gold sterling reserve. I gave 58 including half the value of rupees, but if we take sterling and gold it works out to-day at 33 per cent., which is only 2 per cent. below England.

5087. Supposing we have about 150 crores of rupees in active circulation?—I have got 200 down.

5088. Supposing we have the same amount, or perhaps a little less, of rupees held up in some form or other, could you estimate at all how long it would take for the normal increase in the requirements of currency of the rupee circulation to absorb those hoards into circulation?—The difference between good and bad monsoons which bring out rupees would make adjustment easier. It would mean that a large number of those rupees after bad monsoons would come back into the coffers of the Government, who would refrain from re-issuing them.

5089. But at the same time you remember we are meeting the needs of the country for a normal increase of circulation by the import of gold and the issue of gold certificates against it?—Let us take a bad monsoon when your rupees come from circulation into your coffers. Then it is for the Government to decide whether they should re-issue those. They could gradually melt those down and sell it as bullion, or use it in other ways. Every year you will find a very great shortage in the change for your rupees. The demand for small coin is increasing and the silver rupees that are withdrawn might be melted and used for that.

5090. *Chairman*: You further recommend that the sale of Council Bills should be restricted to the actual needs of the Secretary of State for the financial year in which the sales are made; that the whole of the remittance operations of the Government of India should be entrusted to the Imperial Bank; that the control of the note issue should be handed over to the Imperial Bank with definite regulations regarding its expansion and contraction; and that I think completes the positive recommendations contained in your memorandum as regards possible improvements.

5091. *Sir Alexander Murray*: You referred a moment ago in reply to a question of the Chairman, Sir Victor Sassoon, to the point that Government should have intervened at 1s. 4d. instead of at 1s. 6d., to fix exchange at 1s. 4d. instead of at 1s. 6d.?—I think I suggested that on the argument that had been put forward if this Committee had been sitting a year ago, the 1s. 4d. rate would have been upheld. As a matter of fact my own feeling is that the mere fact that the Committee is sitting to-day or then is not to my mind sufficient reason to advocate either a 1s. 4d. or a 1s. 6d. rate.

5092. But the fact is that Government did actually intervene on a 1s. 4d. basis, isn't that so?—Yes, it did for a period and then changed.

5093. But they actually intervened on the basis of 1s. 4d. gold?—And then if I remember rightly, they moved up to 1s. 6d.

5094. You suggest that we would be better off on a gold standard? Isn't it true that gold prices in India would fluctuate with gold prices in other parts of the world?—They would be influenced by world prices. But where you have got a country which exports foodstuffs you do not get the fluctuations as absolutely as in a country like England which imports its foodstuffs and which would feel the influence to the full extent. In a country which produces its own foodstuffs a good deal depends upon the harvest.

5095. Speaking generally one of the main advantages of going on to the gold standard is that prices will fluctuate uniformly all over the world on the basis of the gold standard?—I do not think that that is so. In certain cases they would; in the imports they would; but in your foodstuffs they would not necessarily, that depends on your home harvest; just as sometimes you might get your prices locally, even under the gold standard, above the gold prices of the world.

5096. Do you remember that a year ago America's price index number was actually 149 whereas the index figure for India was 179, Calcutta 181, Bombay an average of 180; that is to say, gold prices in India a year ago were actually 31 points higher than American prices?—The danger of the index figures, which the Chairman has already pointed out, is more emphasised when you are dealing with a country like the United States and comparing it with a country like India. The index figures are not so useful in comparing one country with another as in showing the fluctuations inside the country and even then as the Chairman says, it is dangerous to rely on them I do not agree that as a comparison they have any value at all between conditions so wide apart as those which exist in the United States and in India. I mean the standard of living in the two countries is so different that I do not think you could compare them.

5097. It is rather an extraordinary coincidence that now in 1925 the price index numbers in all three countries, Great Britain, the United States and India, are more or less in line with one another, namely, 157?—I shall be interested if that is the case to know exactly how the prices of your cereals and pulses compare with those of those other countries.

5098. The cereals and pulses are included in your average prices?—Yes, but I should like to have those taken out here. Cereals and pulses affect something like 80 per cent. of the agricultural population.

5099. You cannot take individual things; individual prices must fluctuate even under the best managed system?—But if 80 per cent. of your population has to depend on cereals and pulses, I think those should be taken into account.

5100. You are a representative of the Bombay Millowners' Association?—But as the Chairman put it at the beginning, I am also here to make suggestions for the benefit of the country and not merely from our point of view.

5101. From the millowners' point of view am I right in saying that the wages in Indian mills have gone up 130 per cent. If 100 is the pre-war figure it is 231 now?—Quite true; they have gone up from 100 to 231.

5102. But the cost of living has never been above 190?—That is right.

5103. And your last wage increase was given in 1921 when the cost of living level was actually only about 177 according to the figures I have here?—That is where the discrepancy comes in. There are two forms of raising wages. One is a percentage which is an increase over all rates, that is to say, if your rate is 100 and you give a 70 per cent. increase for cost of living he gets 170; but the mill industry as well as giving that 70 per cent. over the 100 raised the basis, raised the 100, and the net result is we have 231, if you take wages to-day compared with 1914.

5104. And the cost of living to-day is 151 as against 100?—Yes.

5105. And you think you are justified in not putting pressure on your workers to reduce the cost of living as they have done in other countries. For instance when you gave the last increase of wages in 1921 the index figure in Bombay for the cost of living was 177. In the United Kingdom it was 219. In the United States it was 217. Well, since then the United Kingdom and the United States of America have each dropped their index number by 40 points. You have only taken yours down about 20 points?—Well, the cost of living is not the same in two different countries. I think a good deal depends upon the percentage of necessities against the total amount of the cost of living in the two countries.

5106. Quite true, but I take it the cost of living is more or less on the same lines in those countries. What I mean is that other countries have reduced their cost of working expenses more in keeping with the reduced cost of living?—Other countries have certainly reduced wages but one of the great arguments of labour to us when we have given them these figures, is that although they agree that they have had a much bigger rise in wages than there has been in the cost of living, they maintain that the standard of living was so low before the War that it should be raised for the industry, and do not propose to go back to the state they were in before the War.

5107. Not entirely?—Not at all. If you ask Mr. Joshi he maintains it should be increased to-day. As you know, where an industry is making money, it does not mind sharing some of it with the workers, but not otherwise.

5108. Yes, but you have not been making money for the last few months?—Well, we tried to reduce the cost of living.

5109. Not having got that, you got the excise duty removed?—To be quite frank, having the excise duty reduced so balances the wages and the exchange that we are really no better off than we were before; but as a pledge has been given we have to restore the cuts. As a business man I can say it is not justified.

5110. And the Millowners' Association now suggests that the rate of exchange should be reduced from 1s. 6d. to 1s. 4d. in order that the $12\frac{1}{2}$ per cent. cut you would like to have made but could not might be covered in that way?—Not entirely or merely in our own interests. It is going to benefit the 80 per cent. of agricultural labourers who are dependent on the cereals and pulses and in that way it will benefit the whole country. We are not asking for it against the country but with the country.

5111. *Sir Maneckji Dadabhoy*: Sir Victor, am I right in inferring from your discussion that the ratio of 1s. 6d. has not continued sufficiently long to give us any idea that it has settled down at that rate and that we could revert conveniently to the former ratio of 1s. 4d.?—I take the view that if it only took from March to now to get that rate and it was done so simply and so easily and wages have not to my knowledge dropped during that period to make up for the exchange rise, if you returned to the 1s. 4d. there would be no necessity for wages to rise because wages did not drop in that period.

5112. There would not be any appreciable economic disturbance?—I say we did not have a drop in wages, so there need be no rise in wages; the two balance each other.

5113. And people during the last 25 years have got accustomed to the ratio of 1s. 4d. in all their dealings and transactions, and to them that ratio would be more preferable than the ratio of 1s. 6d.?—Certainly.

5114. You have stated in answer to the Chairman that if we went back to 1s. 4d. there would be no rise in wages in your districts. Do you fear any serious disturbance in the internal economy of the country in rural areas?—I think there would probably be some rise in the price of cereals and pulses. I think I said to the Chairman that I thought that prices would probably rise to some extent but to a very small extent compared to the $12\frac{1}{2}$ per cent.

5115. Can you give us some idea of that rise as compared with the $12\frac{1}{2}$ per cent. Have you worked out the figures?—No, but I am just looking at the difference between September, 1924, for cereals and October; there has been a drop of 7 points there, but of course the big trouble admittedly in this is that articles like cereals are affected by world prices to a certain extent, and that this drop of 7 may not be due entirely to the exchange going up to 1s. 6d.; it is bound to be affected by world conditions as well. That is the danger of taking these figures. I do not feel somehow that in the short period between March and now we could be feeling the drop; we ought just to be beginning to feel the drop. There is always some delay. I do think that any drop there might have been during that period due to exchange would only just be beginning now to make itself felt. So if you turn to the economic side of the matter, the people would not have been feeling the effect of the drop till very lately.

5116. And would you do it immediately or would you require some period?—My own personal feeling is that if it is done immediately, you would have no trouble at all because the effect of 1s. 6d. is only just beginning; the quicker you are, the less the effect will be and the less you will have to undo.

5117. Regarding a gold coin your Association expresses its preference for the sovereign?—A sovereign or else an Indian coin of the same value.

5118. From the point of view of the Empire, would it not be more advisable to have one gold coin all over the Empire like the sovereign?—You mean in contradistinction to having an Indian sovereign?

5119. I mean if you are going to have a gold currency would not that be desirable?—If everybody else has it. But supposing South Africa, and the Dominions; Australia has its own golden sovereign I know. I have seen them and handled them; if they want their own sovereign, there is no reason why we should not do the same as they do, but I see no reason why we should have only the English sovereigns.

5120. And would you have gold coins of smaller denomination?—As I say, my own personal opinion is not quite the same as my committee's. My committee have not only meant the sovereign. Feeling as I do that it would be better not to encourage hoarding of gold, I should personally only have the gold sovereign, so that if they want to hoard they will only hoard the sovereign and not smaller coins. That is my personal view.

5121. (*Sir Purshotamdas Thakurdas.*) Regarding wages you said you had made no cut since 1921. Was not there something like a bonus which you paid to the millhands which had been taken off?—I was talking of a cut in wages which did not include bonuses.

5122. Do you include the bonus in the figure you gave, 231?—No: they have had bonuses on top of that 231.

5123. When did you discontinue the bonus?—Two years ago.

5124. Therefore since 1921 you have actually reduced something from the return to labour, which it had before?—That is true, but it has not been included in the increase over 1914.

5125. Any way you have made a cut or a decrease in payment to labour?—Yes.

5126. If you add it to the 231, what would that come to?—It was one month's wages per annum; but only some of them made the full amount, since most of them worked only for certain periods.

5127. What was the average?—It was about 5 per cent.

5128. When did you begin to give the bonus?—1919.

5129. And when did you discontinue it?—1924 (i.e., no bonus was paid in 1924).

5130. Did the labourers go on strike when you cut off the bonus?—Yes.

5131. How long did they remain on strike?—Six weeks.

5132. And then they reconciled themselves to it. They came back to work without the bonus?—Yes.

5133. Just one more question: it can be said by some critic that you are seeking the 1s. 4d. rate in order to benefit the industry at the sacrifice of the labourer. Would this be a correct representation of your point of view? You have said in your written statement that if 1s. 6d. was to continue it is likely that you may have to insist on a cut in wages, and that might entail a long strike and a good deal of trouble between labour and their employers?—As I said in reply to the Chairman, 1s. 4d. exchange would merely make a cut of an extra amount which the labourer got without knowing it in the last fifteen months; if we do not have it, and conditions do not alter, I think we will have to make a cut which would entail another strike.

5134. Which means that 1s. 4d. would enable the employers to avoid that cut which would otherwise have to be made?—Exactly.

5135. (*Sir Purshotamdas Thakurdas.*) If the scheme of gold standard was likely to cost the country a fair amount, do you think that in the interests of the tax-payer you would disapprove of the introduction of the gold standard owing to that cost?

5136. (*Chairman.*) Perhaps it would be more convenient to the witness to answer if you put a figure to him.

5137. (*Sir Purshotamdas Thakurdas.*) Say a crore or so per year?—I should think that the advantages to the government from the existing taxation under 1s. 4d. would more than make up anything like a crore a year; they would get a bigger return from their present rate of taxation by certainly more than a crore, than they would get by 1s. 6d.

5138. I was thinking more of the cost the gold standard and currency would entail on the tax-payer: if it entails an additional cost of a crore of rupees on the tax-payer, would you have a gold standard in preference to a gold exchange standard at that additional expense, or do you think it would be too much to pay?—I do not think that it would be necessary, because I think that the gain to the State by going back to the 1s. 4d. rate would more than compensate for the one crore.

5139. (*Chairman.*) Just to make it clear, I think what Sir Purshotamdas refers to is the cost of introducing a gold currency, while you are referring to the cost of returning to 1s. 4d.?—I personally would prefer to have a gold standard; I feel sure my committee would prefer to pay a crore and have a gold currency.

5140. (*Chairman.*) The Commission is very much obliged to you and your colleagues for your very full assistance this afternoon.

(*The witness withdrew.*)

FIFTEENTH DAY.

Monday, December 14th, 1925.

PRESENT.

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.

Sir PURSHOTAMDAS THAKURDAS, C.I.E., M. B. E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER (*Joint Secretary*).

Dr. BALKRISHNA, called and examined.

5141. (*Chairman.*) Dr. Balkrishna, you are a Master of Arts and a Doctor of Philosophy?—Yes, Sir.

5142. And Principal of the Rajaram College, Kolhapur?—Yes, Sir.

5143. You are kind enough to come to assist us to-day with your evidence, and in particular you have given us the advantage of a very full memorandum,* in which you set out your recommendations and support it by your reasons, which enables us to apprehend the nature of your views. I should like to ask you a few questions to understand precisely how your scheme in your opinion would work, and to elucidate any point that requires elucidation. I understand your proposals are that, while a gold exchange standard should be retained for a year or two, until 1928 in fact, the ultimate ideal should be what you describe as a gold standard, that is, a standard with a gold currency?—Yes.

5144. In the first paragraph of your recommendations you say:—"The most effective measure to secure both stability in internal prices and foreign exchange is to introduce gold currency in the country, as the Gold Standard is comparatively the most stable standard." Could you amplify that a little by giving us your reasons why it is that a gold currency in the country achieves a greater stability in the standard?—Well, going through the last fifty years, that is, from 1870, I should say, or 1874, we find the countries which were having a gold standard

* Appendix No. 26.

had of course got fluctuating prices to some extent, just as in England, for instance, prices were fluctuating, but from 1900 practically we find, up to the outbreak of war, prices had been rather stable. There had not been much change. When we come to the war period, of course the conditions become abnormal, and therefore we cannot base our conclusions for a gold standard or any other standard because prices were altogether divorced from the gold standard, and they were based merely upon the inconvertible paper money. Therefore, our conclusions can be based only up to the war period, that is, 1914. From 1870 roughly, of course up to 1914 we find that the countries which were having this standard show no great fluctuations in prices.

5145. The countries which were having which standard?—The gold standard with a gold currency. England and Germany, France and the United States. I do not say that these were not having fluctuations, or a rise and fall in the prices, but not so much. And the world prices moreover are linked together, and therefore there is always a stability for time as well as for space. And thus, as I have said, gold finds its own level. Naturally, the prices will be made stable. They will not fluctuate so much in various countries, and if they don't, that is within the confines of the country also, there will not be much variation in prices. We have to see the effect of the gold standard over time as well as over space, and I believe that statistics also go to prove that there has been such stability both in time and in space.

5146. By a gold standard you are referring to a standard, the principal feature of which is a gold currency, and, as I understand you base your opinion in this paragraph upon your observations of the conditions in those countries to which you refer before the war—England, Germany, France and the United States?—Yes.

5147. Can you tell us what proportion of the active circulation of those countries was in gold?—Well, in England we might say it was merely one per cent., one or two per cent., not more than that, of the whole money instruments, that is credit instruments included, note circulation and gold coin. All these put together, if we say the ratio between actual gold circulating in the country and credit instruments combined, of course functioning as money, I will put it between one and two per cent. only. But it is not a question of the proportion or ratio between the actual gold circulating in the country and the credit instruments which are functioning as money, but the real question is whether there is a convertibility—a free, automatic convertibility between gold and all those instruments which do the function of money. Drafts, cheques, notes, these things when they are freely, automatically convertible into gold, then there is no question whether the circulation of gold actually is large or small. It is the gold basis, and the belief that they can be converted at any time into gold that places them on the same level as gold itself.

5148. We arrive then at the first elaboration of your paragraph, that one must not regard the actual amount of gold in circulation as that which gives stability but the ready convertibility of the actual medium of circulation into gold?—Yes. And along with this convertibility there is the second point also which we should say is the free flow of gold, that is export and import also. People know that whenever they want gold they can export it or they can import it. Free and automatic gold standard or full gold standard means free convertibility as well as a free flow of money.

5149. When you refer to convertibility, do you mean convertibility for internal payments or convertibility for international payments, or do you perhaps mean both?—Both. Therefore, I say free flow of money from and to a country. Therefore, both.

5150. What do you think is the relative importance of these two aspects of convertibility in securing stability?—Well, I think it differs in various countries. It all depends upon the use of gold which people are habituated to and at the same time upon the idea of security which the people have got regarding their governments and the banks. Therefore, I don't think there can be any cut and dried figure given here as to the relative importance of convertibility of these two items. In India, for instance, we find that there is a great deal of apprehension that the Government may not "convert rupees and notes into gold." And similarly there is not much use of gold also. The people are not habituated to it, naturally we require a great deal of circulation here. There will be a greater circulation of gold here than in England where the people are habituated to these things and the people have got an idea about the full security of the Government as well as of the banks.

5151. You now make an illuminating reference to the question of confidence. Could you tell us whether, in your opinion, the convertibility of the internal currency into gold, apart from the question of confidence, has any effect upon the stability of prices. I am differentiating now between internal and external convertibility, and I am asking whether, in your opinion, the fact that the token currency is convertible into gold for internal purposes has any effect upon the stability of prices, apart from the question of confidence?—Yes. If the token money which is now, for instance, the rupee, is inconvertible, then it means that the agency which is issuing that token money has got full control, and instead of automatic agencies we have got controlled agencies, that is, a managed currency, and all the evils of a managed currency will be there. It is only according to the dictum or the discretion of the Government to issue, to expand, the currency, as well as to contract the currency, and naturally the prices will depend more or less upon their discretion and not upon the automatic operation.

5152. I quite follow that. Leaving aside for one moment the question of the possibility of inflation, you would agree, I imagine, that, apart from that, stability of prices is secured by making your internal currency convertible at a steady rate into the medium of international payment?—No, I beg to differ.

5153. I am reserving the question of confidence and of inflation?—Well it is not a question of convertibility into an international medium—the convertibility of the money that is circulating in this country for instance into an international medium, because prices are not I believe controlled or influenced by only the international medium. Prices in India have been going on, say, in one course, while prices in England might be going in another course. We cannot say that prices are controlled altogether by any international medium. There is no such thing. In that case convertibility into an international medium does not mean much. As I have shown, our internal trade is vastly more important, and in each country of course it is much more important than the foreign trade; and, moreover, if India has got the rupee, as it has up to this time, inconvertible, the prices are altogether divorced from international prices. I should not use the word "altogether," but they are divorced.

5154. You would not agree that if the external convertibility of your token currency for external payments is assured, the effect of internal convertibility upon prices is not a matter that can directly arise?—We shall first have to ask ourselves what is the standard of value, gold or the rupee.

5155. Of course prices can be upset by the currency authorities by increasing the amount of internal currency in relation to the business of the country. Can you assist the Commission by explaining how and why it is more difficult for the currency authorities to do that with what you describe as the gold standard than it is with what you describe as the gold exchange standard. What are the additional safeguards?—Under the gold exchange standard for the present, are we to postulate that gold will not be given for internal purposes, gold in exchange for rupees and rupee notes?

5156. Yes; for an exchange standard you should postulate that gold is given only for export, either in the form of foreign exchange or in the form of gold metal?—Well in that case there is no automatic flow of gold either into or from the country, and India, so to speak, is separated from the rest of the world in the quantity of its money.

5157. Supposing the currency authority undertakes to buy and sell gold for export at the gold point, can it be said then that there is no automatic export of gold?—There will be to a certain extent. But the question is whether the rate at which they are selling this gold is a controlled rate or whether it is the natural rate which is in the market at that time prevailing. If it is a pegged rate, naturally there will be a difference.

5158. It is a fixed rate, fixed if you like by statute?—But take the 2 shilling rate at that time when it was so fixed and the market rate which was quite different. In that case we know what has happened. The market rate may be 1s. 10d., and the statutory rate may be 1s. 4d.: how are the two to be accommodated?

5159. The ordinary working of a gold exchange standard is that it is based upon reserves adequate to enable the currency authority to control the exchange market, within foreseeable fluctuations, in a manner that will enable it to keep the rates within the gold point. If the market rate differs from the adopted rate, if the market rate actually moves outside the gold point, the reserves are exhausted and the system breaks down?—We know that the system broke down in 1919-20 when the rate was fixed at two shillings.

5160. We will leave that question for the moment; let us go back to the question which you are assisting us upon as regards this danger of inflation. What are the safeguards under your gold currency standard which do not exist under any exchange standard system?—There is, first, as I have said, the free minting of gold. Gold will be brought into the mint and exchanged for sovereigns and sovereigns may be brought in for gold bullion. This free minting of gold automatically serves to stabilize the foreign exchange as well as the internal prices. Secondly, we have got the question of the free export. When England had laid an embargo upon the export of gold, naturally, on account of that the price of sterling could not be kept to the gold point. So there has been a depreciation. So in India also will be the case. Free exportability as well as free minting, then free convertibility, that is so far as notes are concerned, these are the three things which will be done under a gold standard and they would always depend upon market conditions. If more money is required, people will be coming forth with their gold to get it converted into sovereigns. If less money is required, naturally they will send in their notes and the money will contract. So these things are not to that extent possible under the gold exchange standard.

5161. Might it not be said that your safeguard against inflation is the observance of a due proportion between your reserves and the currency issued against those reserves. If the currency authority, whether the Government or the Bank, chooses to disregard the normal or the legitimate proportion of reserves to currency, then what is there to prevent it doing it in the one case rather than in the other? In order to put that question to the test of practical experience, did those countries to which you refer, England, Germany and France, which had the gold standard which you recommend, find the least difficulty in inflating to their hearts' content during the war?—Well we cannot say that there was the same automatic standard during the war as before the war.

5162. That brings me to the point of my question, and that is, would any standard prevent the currency authority from inflating, if it chooses to do so?—Oh, yes. When we come to the actual gold, we know of course that is a very small amount in circulation, in active circulation. Largely of course money depends upon credit instruments, whether currency notes, bank notes or cheques. In that case it is these which have to expand and which have to contract and they have got an automatic tendency. People will be bringing back, sending their cheques, their money, for deposit or sending their notes back to the banks. Naturally money will contract, but here there is no such thing. Our rupee is inconvertible under the gold exchange standard and the whole management is under the Government. We know of course that Governments are tempted to issue more at certain times.

5163. I understand that your preference there for a gold currency is based upon the circumstance that, under the exchange standard system as it was functioning in India, there was no provision for the automatic contraction of the currency, which is, I think, admitted on all hands to have been an obvious defect of the pre-war system. Is that defect remediable, in your opinion, on an improved exchange standard system, or is it not?—I do not stand for a managed currency at all.

5164. I am trying to examine a little deeper the process of your reasons for and against?—I have said that Governments cannot be relied upon in this matter; no Government, not the Indian Government alone; the Governments of Germany, England, all Governments are here on the same basis. Therefore, we should trust this function only to the Banks.

5165. Just examining your last reason, which I see weighs with you, against the exchange standard system, that is the failure to make any provision for the automatic contraction of the currency under that system before the war, I should like to have your opinion on this contention which has been put to us by various witnesses: that you might have an exchange standard system which would be automatic as regards the contraction of the currency in this matter. It was not automatic before the war because, when there was a demand for sterling with a falling exchange, that could be covered by borrowing from the gold standard. When the gold standard reserve was reduced, there was no reduction in the currency reserves, and therefore no automatic reduction of the currency. What has been said to us is that you can remedy that by combining the gold standard reserve and the paper currency reserve, so that there should be a fixed relation between your reserves in any form of currency, and there could be no possibility of diminishing your reserves by the sale of sterling against local currency without an immediate contraction of the local currency. Would that, in your opinion, remedy this defect to which you refer, the failure automatically to contract the currency?—For the last few years the paper currency reserve as well as the gold standard reserve have been combined. Paper currency reserve also was located in London, I mean so far as the gold portion is concerned.

5166. They were not combined in the sense of there being any necessary relation of strength between the gold standard reserve and the paper currency reserve. But in this essential, particularly from the point of view which I am considering, there was no such combination, was there?—The paper currency reserve, so far as I know, was in the minds of the authorities also kept up for exchange. In that case, in the gold exchange standard, we have got much emphasis laid only upon the stability of exchange rates. We are viewing currency from the point of view of foreign exchanges. Why is foreign exchange alone so very important that it should be kept in view? The prices, internal prices, and the stability of internal prices as well as the other things which are connected with a sound currency system, why should they be not before us? We have to see how we can attain, how we can achieve, a sound currency system in India which should work both for internal purposes as well for foreign exchanges. The foreign exchange standard merely shifts the question. It lays a stress upon, say, a part and a very minor part I should say, while the major portion is altogether

neglected in that way. The latter is shunted off from our way. I do not think a gold exchange standard can give us a sound currency.

5167. It is important to remember that that is the first question with which we began,—how gold currency in relation to internal convertibility, as distinguished from external convertibility, can possibly affect internal prices. Now let me ask you one or two questions upon points which are of interest in your memorandum. Under question 4 you deal with the important question of the future of the rupee? —Yes.

5168. I understand it is your recommendation that the rupee should ultimately be demonetised to the extent of making it no longer legal tender for any sum above Rs. 1,000?—That is for the present; not for ultimate purpose. Only at present, for a few years. I have suggested that as a tentative measure only.

5169. Then I think I have not quite followed you. Do you suggest that there should be an immediate measure to demonetise the rupee to that extent, or that you should wait?—Up to 1,000 it should be legal tender. But if we find that this also will be inconvenient we can reduce the limit to 100 or to less even. As present I propose that this should be as I have stated according to the reasons I have given.

5170. That you would do at once?—Of course; in 1928 as I suggested. If we are having this as a standard, naturally the rupee will be legal tender up to 1,000.

5171. In paragraph 3 you say that "the people of India are used to the rupee for the last several centuries. The demonetisation of silver will not be liked by them?"—Yes.

5172. Do I understand it is your opinion that that adverse effect would be wholly prevented by maintaining the large limit of Rs. 1,000 as legal tender? —I want to introduce slight changes if possible in the very beginning. That is my point and as a large amount of business is still to be done with rupees or by means of rupees, the people ought not to be put to any trouble. The masses generally are more or less habituated with the use of the rupee and therefore I want to cause as little trouble as possible.

5173. To understand how this will work, you say the gold exchange standard should be continued until you take complete control, with this modification that rupees and rupee notes shall be redeemable in gold notes. Gold notes would be redeemable in gold, would they not?—Yes.

5174. What I wanted to make clear was that in that case in effect rupees and rupee notes would be redeemable in gold. You get your gold notes against rupees and rupee notes, and gold against gold notes? —No. Gold notes will be given in exchange for rupees up to 31st March 1928. I say, let gold notes alone be given in exchange for rupee notes and rupees. That is, gold is to be given for foreign remittances and not for internal use.

5175. But the gold note is not itself to be encashable in gold?—No, not up to 1928 according to my scheme. We want to bring in the use of gold notes and when the people have been habituated for 2 years with their use and Government reserves also are sufficiently backed up, then it may be that gold may be given in exchange for gold notes, rupee notes and rupees.

5176. If one's desire is to inspire confidence, would not there be certain disadvantages in issuing a thing called a gold note which is not encashable in gold? Might not that tend very much to discredit your efforts to inspire confidence in the free availability of gold?—I think not; because we will have gold backing for gold notes. That I made clear; and the people when they have that confidence that with a gold currency gold standard will begin from 1st April 1928, then naturally there will not be any apprehension.

5177. For this period till 1928, against gold notes people could only get silver rupees?—Yes, silver rupees and silver notes.

5178. And you do not see any disadvantage in producing an impression that a thing called a gold note is in fact a thing against which you can only get silver rupees?—This is to habituate the people, instead of rupee notes, with gold notes and to have the unit of value, so to say, gold instead of silver. That can only be done slowly. Therefore we go step by step and that is the first step that I am proposing.

5179. My difficulty is that it appears to me that what you would be habituating people to is that they must understand that the thing called a gold note is a thing against which they can only get silver?—It is only for the interim. It is the mercantile community and the educated people who have to understand the whole thing, not the masses. The masses will not use many notes. If the mercantile community and the educated classes know that the intention of the Government is to begin initiating full gold standard from 1928, they will have confidence in the thing. We must allow some period for the reserves to be built up and if from the beginning we go on giving gold, naturally our reserves will be depleted.

5180. When you come to the period at which you begin to demonetise silver, as soon as it gets known that silver rupees are to be no longer full tender, even with the limit of 1,000 you fix, what effect will that have on the holders of rupees in hoards and as stores of value?—I do not think there will be much depreciation. That is the reason why I keep that limit very high. I do not say that rupees will be demonetised, because the stock of rupees when the population is increasing and when the demand for trade also inceases, no rupees being coined, will barely suffice and there will be no demonetisation in the actual sense of the word.

5181. At this period you will be beginning to give gold against rupees?—Yes.

5182. Would not you look upon it as at any rate possible that the result might be a great rush to change the silver hoards into gold, or do you think that is not likely?—I do not think so, on account of the reasons I have given. I say that the demand for the rupees will be sufficient and therefore I propose that there will be no actual demonetisation of the rupee, unless of course we find by experience that a great quantity has been returned to the treasury.

5183. In view of the possibility of a rush, do you think it will be prudent for the currency authority to undertake the obligation to give gold against rupees without providing against, at any rate, the possibility, because it is a serious thing, is it not, to undertake an obligation which may attain a certain maximum limit without having covered that maximum?—I find that about 74 crores of rupees are in the two reserves in London, that is the figure for 1924-25.

5184. 74 crores of what?—Gold and gold securities. Then there are 21 or 22 crores with the Currency Department, gold, I mean. This comes to 95 crores and within these two years we will be getting gold. If we get it even at the rate of 20 crores, we will have 40 crores. 95 *plus* 40 comes to 135 crores and so there will be a large amount of gold there.

5185. What is your estimate of the amount of rupees which is likely to be presented for substitution by gold?—It all depends upon the stock of silver rupees that we have got. I could not come across any latest estimate of the rupees in circulation.

5186. You have not been able to form an estimate of that?—No, I could not.

5187. Without forming an estimate of that kind, it is difficult, is it not, to form an estimate of the amount of gold that should be held before the step could safely be undertaken?—I think there will not be a rush, on account of the reasons given before. I am sure because every day there is the use for the rupee. There will be no question of a rush of that

kind. The rush can only be when there is any non-confidence in the Government or in the inconvertibility of the rupee. When they have got full confidence in the rupee, when they know that they can convert it at any time, there will be no rush at all.

5188. Will it not be a bit of a gamble to depend upon there not being a rush?—No; we have to see human nature. All of us are, of course, students of human nature and I do not think that when there is confidence in the currency authority regarding the full convertibility of the silver into gold and gold into silver there can be any rush. The people will not be panic-stricken in any way and the price of silver will not be going down much because we are not demonetising silver to a very large extent.

5189. In order to attain greater confidence in convertibility before you initiate this step, the only positive step that you would take, so far as I understand, is to issue gold notes instead of rupee notes?—Yes and building up the reserves.

5190. Is that a matter which impresses itself deeply upon the psychology of the hoarder, the percentage of your reserves?—The masses are led by the educated classes and when the mercantile community has got that confidence, this confidence breeds confidence and it percolatos to the masses also. What is our agency for creating any agitation? It is the papers and the mercantile community voicing forth their grievances. When they have confidence in the full convertibility of gold into silver and rupee into gold, I think there will be thorough confidence amongst the masses also.

5191. Your proposal is that the amount of reserves accumulated need not cover the maximum possible demand there might be; it need not take into account a rush for gold. If people really apprehended that the amount that you have accumulated is not enough to cover the maximum possible demand, may that not suggest to them the advisability of being first in the field and getting what there is to get?—This question can, I think, be elucidated by studying the ratios of notes to gold reserves. Well, in the various countries we find that this ratio differs from 14 per cent. generally to say 30 or 35 per cent. There are somo countries which have higher reserves after the War, if we see the conditions before the War and leaving France of course out of the question because the Bank of France has got about 40 per cent. of its holdings in gold; leaving France out of consideration and coming to the normal conditions before the War we find that this ratio varied from 14 to 30 or 35 per cent. gold in the banks against notes, etc., which they had issued.

5192. You are referring to the amounts of reserves held in the Central Banks in European countries against note issues in pre-war times?—Yes, and in that case if full convertibility is achieved we do not find that there should be any difficulty here when we have about 40 per cent.

5193. Does that really provide us with an analogy which gives any guidance as to the amount which we may require under special Indian conditions, where, as we are told, we must contemplate the possibility at any rate of converting into gold a very large accumulation of silver rupees which are held as stores of value in hoards? Is that not a very special circumstance?—I do not think there is a very large holding of rupees in the country. I was just making an estimate of how much would have been left in the hands of the people by referring to the silver imports from 1850 onwards up to 1925. If we study that, and allowing for a depreciation of 5 per cent. for various uses, then I find very little stock will be left in the hands of the people.

5194. I must not trouble you about the actual figures because you have not the means to make an estimate and we have possibly the best evidence available as to what they are. Turning to another point of your memorandum, let me ask you a question in regard to tho location of the gold reserve. You give some reasons in favour of locating all, or most of, the gold reserve in London. I understand the reasons against that are possible suspicion and misapprehension on the part of the public as to the uses to which the gold is being put?—Not all of them object on that account.

5195. Not all of them do. That is just the point. I want to know, apart from that question of confidence to which due weight must be given, what are the practical reasons against locating these reserves in a foreign centre and not in an Indian centre?—One is that we are buying securities and applying that money for financing foreign trade. If we have these reserves in our own country naturally the trade and industry of this country will be financed. This is the greatest thing. If this 74 or 60 crores at present used in that way to finance other countries were used to finance our own trade and industry, there would be so much more good done to it.

5196. These are the currency and exchange reserves?—Yes.

5197. Just to follow out you opinion, would you assist us to understand how those credits will become more available for the financing of trade and industry by being kept in India?—Of course it is to be supposed that the management will be with the Imperial Bank, not with the Government altogether, but with some Bank.

5198. That is your recommendation?—Yes, with some bank; with the Imperial Bank, the State Bank. In that case the banks have their branches outside also and they are always buying foreign paper. Every bank in every European country to make remittances does hold foreign credits, so at the timo when it is necessary they will remit those foreign credits for making up the exchange if there is an unfavourable balance of trade or buying more. It all depends upon the market conditions.

5199. But are not those processes just the same whether the reserves are held in one place rather than another?—Well, ultimately they do not come to be different but it is the question of the agency. On the one hand trade conditions settle the rate; on the other hand, the Secretary of State has got the discretion and the power to sell and to buy; and that makes the whole difference.

5200. Just to take an hypothetical case, if the reserves were controlled by the Imperial Bank and yet held in a foreign centre your objection on this ground would be removed?—Of course it will be; but in that case the bank will not be holding so much money in foreign securities. We have got so many foreign exchange banks here and they have their head offices in London; it is very easy for them to make all those remittances.

5201. I quite follow how the matter presents itself to your mind. You say here the control of the note issue should not be transferred to the Imperial Bank, because the masses have no confidence in the Imperial Bank. I would like to clear up what your opinion is on that. Do you mean it to be read in connection with your next paragraph, that the constitution of the Imperial Bank should be improved?—Yes, this is to be connected with that.

5202. So I rather gather that what you say is that there might be such a transfer after an improvement in the constitution of the Imperial Bank?—Yes.

5203. Would you tell us what is the substantial nature of the change in the constitution of the Imperial Bank which you would consider satisfactory as a preliminary to the transfer?—The representation of the Indian element should be increased, say in tho directorate, as well as among the shareholders. More capital should be issued and in that way Indians should be encouraged to come in. And then I have suggested that the latest recommendations of the Controller of Currency in the United States of America should also be given effect to in the control of the Imperial Bank by the State, and at the same time I think some committee should be appointed, say a currency committee, from the representatives of the people in the Legislative Assembly who should be kept in close touch with the Bank's affairs, and in that way they would be able to inspire confidence both in the Government and the Legislative Assembly as well as the people.

5204. Do you approach this question of the constitution of the Imperial Bank from the point of view that it is desirable that the constitution of the Indian Central Bank should make it subject to Government control or should make it free of Government control?—I think there should be Government control, but with the proviso that I have stated here that there should be a committee, say a currency committee or a banking committee or whatever you may name it, consisting of elected members of the Legislative Assembly and that committee should be kept in touch with the Bank's affairs just as we have got a Standing Finance Committee to come in close touch with the Finance Department. Similarly there should be a committee of that kind.

5205. What would the functions of that committee be, advisory or executive?—Advisory; no executive functions can be given; those must be mainly with the Directors. The committee will be there merely for checking the business and inspiring confidence among members of the Assembly and through them among the public.

5206. It is a common doctrine among the publicists of Europe that, in order to prevent the interference of political considerations with monetary policy, it is desirable that the Central Bank of issue should be absolutely independent of the Government. I understand that you adopt a contrary opinion under Indian conditions, and perhaps you would tell us what the special conditions are in India which make you think it desirable there should be Government control?—Up to the present fortunately or unfortunately—I think unfortunately—the people have not had confidence in banks. We can divide our banking institutions into two classes, those which belong to India properly, subscribed by Indian capital, and others, foreign exchange banks and others like these, and the Imperial Bank also to a large extent comes under the same. Since 1913 when there were banking failures, the confidence of the people has been rudely shaken in our banking institutions and I do not think that up to the present time it has been fully restored. People are not very much connected with the foreign banks, that is, the foreign exchange banks and others; they do not come much in contact with them, and they are not doing their business also for internal purposes. In such a case it seems to be, in my opinion, a fact that people have not got as yet any knowledge of the

5209. Now, let me ask you a question on another passage in your memorandum which may perhaps require some elucidation. On page 9 you say that seventy million pounds of gold in circulation in India will do an incalculable good to trade and industry here; and lower down you say that the world owes so much money to India and we can claim its payment in the form of gold. With regard to that, is it in your opinion better for India, when the choice is open, to import gold and silver rather than the corresponding value or securities or indeed definite wealth-producing commodities?—The value of the two reserves in London is 73 crores; and the question is whether they are to be brought back in the form of gold or securities: I suggest that they should be brought for the present in the shape of gold; naturally that conclusion would follow.

5210. My difficulty was about the words "in circulation." I wondered whether we were to take it that, in your opinion, gold in circulation enriches the country more than the gold's worth in the form of good investments abroad or commodities brought home?—In the shape of securities also it will be giving a help to our trade and industry, if those securities are in India.

5211. Not if it is in circulation?—I do not mean here actual circulation; what I mean is that if it is brought to India naturally we will have a gold currency; of course it will go into circulation; but I do not mean in actual circulation.

5212. Again another point in your memorandum that I think you can elucidate is where you say: "Gold Standard will not be much more wasteful in India than in France or Italy." What would distinguish our gold standard in India from that in France would be that there will be gold actually in circulation?—Yes, in India it will.

5213. In France it is not?—Not so much as it will be in India; there is more gold in circulation in France and Italy than there is in England on account of the cheque system prevailing there and the credit system being more used.

5214. Accepting for the purpose of my question the assumption that it is desirable for ulterior reasons to have gold in circulation, I suppose we can agree that to put gold in circulation is an actual expense?—Yes.

it; in the first six months there may even be what is called a rush. There will be a demand no doubt.

5219. There will be some demand against which it will be necessary to provide some further stores of gold?—Yes.

5220. And in so far as it is necessary to provide some further stores of gold that will involve some expense?—Yes.

5221. Have you been able to estimate at all what the expense involved would be?—No; I have not actually worked out the figures.

5222. We are looking at this from the practical point view?—I can express it in this way: that taking 1 per cent. to be the increase of population and, say 1 per cent. for the increase in prosperity, it means about 2 per cent. increase every year in the circulation. We have got, say, 400 crores of rupees in circulation. We require about 2 per cent. a year more. Silver will not be monetised, but instead gold will be monetised and at the same time some money will be returned, that is, rupees will be returned to the treasuries, and gold will be required instead to some extent. So for the first six months there will be a large demand; but after that when normal conditions have set in I think we can take about 5 to 6 per cent. as the demands for gold for actual circulation.

5223. Taking it at that figure, it is very relevant to consider, is it not, when we are considering the practical advantages and disadvantages of the proposal, what it will cost, because it might indeed cost so much as to be prohibitive. On the other hand it might cost such a mere trifle as to be quite negligible. Somewhere between the two one must decide what is the limit of cost at which you think the proposal would be worth while?—I have already expressed that when I said that in the countries which are having a central banking system they have a 13 or 14 per cent. gold backing for their note circulation. I consider the rupee and the rupee note to be on the same level. If the rupee and the rupee notes in circulation are both 600 crores it means that we need have about 25 per cent. backing in gold; that gives us a rought estimate of the gold which will be required for backing our system.

said during the course of the discussion that we have got 74 crores in our reserves; another 20 crores in the paper currency department; that means 94 crores there. It is possible that we may require over and above this amount, about 50 crores for paying gold, that is, by means of borrowings. I think there will not be more demand in the very beginning. During these two years when the reserves have to be built up about 50 to 60 crores will be required, not more than that.

5226. On which the interest charges would be about 2 crores a year?—Yes, at 6 per cent.

5227. Taking it at that figure, would it seem too much to pay for the benefits you mention, or not?—No, I do not think so.

5228. You would be prepared to raise it to that extent?—Yes.

5229. We have to recognise of course that, whatever the additional charge, it will have to be met somehow in the national budget, either by economising or by fresh taxation?—Yes.

5230. There are just one or two more questions I should like to ask. In your memorandum (Appendices, page 225) you express the opinion that the Secretary of State should not have been given the power to sell Council Drafts beyond his own requirements?—Yes.

5231. If you are referring to the working of an exchange standard, is not the power and the obligation to remit without limit at the gold points an essential part of the machinery for the working of any such standard?—Not necessarily. He can draw it through the Imperial Bank.

5232. Even if it is the Imperial Bank that has to draw it. If an exchange is being worked, the way in which that standard works is, is it not, that the currency authority must be prepared to buy and sell whatever it is necessary to buy and sell in order to maintain the exchange within those points?—I may here wedge in one remark and that is this, even if the gold standard is to be kept up, I say it should be kept up on the same level as England has got at present. That is, there are no foreign exchange rates fixed. The exchange rate between sterling and the mark or the exchange rate between sterling and

—Yes. But there is no ratio fixed between the mark (the gold mark I am talking of here) and the sovereign, or the sovereign and the dollar, the sovereign and the franc, or the sovereign and the lira. There are no such rates fixed either by the bank or by the Government at all. It is the day to day operation of the trade which is fixing the ratio. The Government is not doing anything, nor is the bank doing anything. We should say, the commercial community, whatever the conditions of the market are, in the two countries, these are fixing the ratio.

5238. What is the essential difference between that system and an Indian gold exchange standard system, under which the value of the rupee would be fixed at 1/15th or 1/13⅓rd of the quantity of gold in the sovereign?—The sovereign is the circulating medium in England.

5239. The sovereign is not?—Before the war it was, though in very small proportion. But that point has already been cleared, because a small actual circulation of gold does not mean that it is not a gold standard. But let us leave that point for a moment. Let us say the sovereign is the circulating medium in England. Or say the franc is the circulating medium in France and the rupee is the circulating medium in India. Country A and country B are to be pegged to each other for their exchanges. Well, in England you are not now fixing in that way the rates between country A and country B. Neither the bank, I should say, is fixing it nor the Government. During the war, for instance, they had pegging. The English Government then had pegged the sterling to the dollar as well as to the franc. That was merely a managed system. The normal Indian system before the war, as well as up to 1920, I should say has been that of the war, when the English sterling was pegged to the dollar and the franc. What I want is that there should be no pegging at all, as there was during the war, but it should be left to itself. For internal purposes naturally you will have pegging but not for external purposes.

5240. Now on the question of the ratio, returning to your memorandum in which you deal with this question, I understand that you express an opinion in favour of the ratio of 1s. 4d.?—Yes.

5241. In the first place, let me put for your consideration what I imagine might be the contention of a critic who was dealing with this part of your exposition. What would you reply to one who said that many of the benefits to which you refer as resulting from the 1s. 4d. ratio are the benefits which can always be obtained no doubt by a measure of inflation, but that such benefits are temporary, as experience has shown, and are followed by a reaction which produces evil effects which more than counteract the temporary benefits?—Yes.

5242. That is obviously a criticism which might be made in connection with such an argument as you develop here, is it not?—Yes, it may.

5243. And what is your reply?—May I have the question again?

5244. That the benefits which you anticipate here from the effect of returning to 1s. 4d. are benefits which are characteristic of any measure of inflation, that such benefits are only temporary and are inevitably followed, after a period of prosperity, by evil consequences in the nature of a reaction which more than counteracts the temporary benefits?—Is that inflation going to be through the Government or through automatic causes?

5245. How can we get back to 1s. 4d.? That is the first question to which we must direct our attention?—I have shown there will be two things by the adoption of the gold standard, the price of silver will go down and the price of gold will go up. Naturally the ratio will hover about 1s. 4d. That is the automatic effect of that. And it is for internal purposes that we are fixing the rate at 1s. 4d. and not for external purposes. Just as 20 shillings are to be exchanged for £1, similarly 15 rupees are to be exchanged for £1. That ratio is for internal purposes only, according to me, because I am not in favour either of fixing the foreign exchange or having a gold exchange standard, and secondly, as I have said, even if there is a gold exchange standard, let there be no foreign exchange rate. I am here only discussing tho question from the internal standpoint.

5246. Would you mind repeating your answer? Some of us have a little difficulty in hearing the whole of your answers?—I say by the adoption of the gold standard there will be a depreciation in the price of silver and there will be an appreciation in the price of gold. So this appreciation on the one hand and depreciation on the other will bring the ratio of the rupee to the sovereign say to 1s. 4d. and the present ratio of 1s. 6d. for instance will not be retained on account of the appreciation of gold and the depreciation of silver. This is the automatic change which will be brought about between the two prices. Therefore it will not be through the action of the Government. Government has only to adopt the gold standard, the automatic forces will come into play and the ratio will possibly be 1s. 4d.

5247. Could you explain a little further how the fall in the price of silver will affect it, because, *ex hypothesi*, we do not adopt the gold standard except concurrently with the demonetisation of the rupee or its reduction to the position of a coin which is no longer the standard coin?—Yes. Silver is necessary for the monetisation of money—every year, of course, money is being monetised. Henceforth, silver required for the monetisation of the rupee will not be required. There will be less demand for silver. And then there will be the psychological effect also on the silver market. So, less demand for silver for monetisation and the psychological effect, these two will reduce the price of silver. And more demand for gold for the adoption of the gold standard will send up the price of gold.

5248. Send up gold prices?—Yes, the price of gold will go up.

5249. Finally, I want to ask for your assistance in elucidating a passage in your memorandum, where you say; "India as a debtor nation will be benefited by the return to 1s. 4d." It is not quite clear to me how India would benefit by having to find more rupees to meet a given sterling obligation?—It will have to sell less commodities, and in that sense it will be gaining. A falling rate is more favourable to debtors because they can easily pay off their debts by paying money of less value. So India also is in the same category as other debtors are.

5250. But as regards her sterling obligations, she would have to sell more of her produce in order to raise the same amount of sterling credits, and must that not be set against any other possible benefits?—How? I beg your pardon?

5251, In order to raise certain credits to pay fixed sterling payments, she will have to sell more of her produce?—But that will not be the case if there are higher prices, naturally there will not be so much; or more produce will not be required; it all depends upon the price and the quantities.

5252. Does it not follow from that that, in this matter as indeed in all others in connection with a fall or rise in exchange, you usually find some other side of the account to be considered beside the first, some detriment to be set against the benefit? —Therefore I have stated the question from both the points of view.

5253. (*Sir Reginald Mant.*) There are two points in your recent replies to the Chairman which I did not quite follow. In the first place I understood you to say that the adoption of a gold currency would reduce the price of silver and bring down the value of the rupee. Now the rupee as we have often been told may be regarded as a note printed on silver. If you reduce the price of paper, it will not bring down the value of the paper note. Would you explain how reducing the price of silver would bring down

the value of the note printed on silver?—I do not think that I said so, that the price of the rupee in that way may be brought down. The price of silver will be brought down, and we are considering here the ratio between the price of silver and that of gold. Therefore when there is a greater demand for gold, gold will go up in price, while the smaller demand for silver will reduce its price. The ratio prevailing now between gold and silver will not be the same as it will be when we adopt the gold standard and demonetise our silver. If we have pegged the rupee at 15 or 16 or 18 to the pound, that ratio will remain. That has nothing to do with the price of silver because the rupee is a token money. The price of the token money will be in no way affected by the price of silver going up or going down.

5254. How does the price of silver come into the argument? What is the relevancy of your reference to the price of silver? I did not quite follow that?—That will be in the case of foreign exchange. Internally, we peg the rupee at 15 to a sovereign. This is in no way affected. Of course, if the ratio is such that the silver in the rupee is more than it can be had in the market, naturally it will have an adverse effect. The ratio should be such that the value of the silver in the rupee will be less than it can be had in the market. But for external purposes we have to see that the ratio of the prices of silver and gold, whether it will be 1s. 6d. or 1s. 4d. or any other ratio between the two I think that the natural rate, the natural ratio of the prices of silver and gold, will vary on account of the adoption of the gold standard and the demonetisation of silver and it will be anywhere between say 1s. 4d. and 1s. 6d.

5255. I presume the immediate effect of reducing the value of the rupee to 1s. 4d. would be an increased demand for currency in India, would it not?—Why?

5256. You would require a larger number of rupees to carry out the current transactions of the country, if the rate be 1s. 4d. than if it is 1s. 6d.? The effect would be similar to what has been called inflation?—As I have suggested, you might issue gold notes and issue the rupee notes, but as I suggest, we should for two years issue gold notes only so that people will be habituated to that form of currency.

5257. But the results which you anticipate, appreciation of prices and the stimulus to trade and industry, would be similar to those which ordinarily follow from inflation of the currency?—Yes, the inflation of the currency by automatic causes. If the trade requires an increased amount of currency there will be an inflation. If the trade does not require it, then there will be none.

5258. But this is not an automatic increase? The proposal which you make to reduce the value of the rupee from 1s. 6d. to 1s. 4d. is not automatic? It would be an arbitrary change? There is nothing automatic about that? That addition to the currency will be practically a measure of inflation?—To some extent it will be.

5259. And would not equally beneficial results follow if you carried the process further and reduced the value of the rupee to 1s. 2d.?—We ought to have such a ratio as can be maintained and which should not be revolutionary. The people have of course now been used to fifteen rupees to the pound, and that was the case even in Moghul times; Rs. 15 gold mohurs were used then; moreover the prices of silver and gold are hovering about this ratio. That is what I am saying, that by the demonetization of silver and the monetization of gold in India the prices will come up to this ratio of 1s. 4d. Now the ratio is 1s. 6d. to sterling, which means, to the sovereign it is about 1s. 4d. and some points. When therefore we suggest that it should be 1s. 4d., naturally it will be an automatic change.

5260. You are really supporting the 1s. 4d. rate on the ground that it is a natural rate and because people are accustomed to it?—Yes. Two reasons I have given, first, that it is an automatic thing, that the ratio of the prices of gold and silver will be about 1s. 4d. The second is that the people are used to this, they have been used to Rs. 15 for one pound; and therefore if we keep up that ratio, it will be desirable. Then I give various other reasons which of course support my view that 1s. 4d. is more desirable as giving an impetus to trade and industry and so on.

5261. The other reasons being the usual inflation benefits?—Of course.

5262. The other point which I did not quite follow is this. You said that India being a debtor nation would benefit from a depreciation of the value of the rupee. Would you explain how she would benefit in regard to her foreign obligations?—Well, I look at the question in this way, that so far as commodities are concerned, we have to pay our debts by selling commodities. All that will be paid only by means of exports. So we have to see whether less exports have to be sent or more exports have to be sent for the price that we have to get; and in India of course we will have to dispose of more commodities when we are to get Rs. 15 for one pound. Fifteen rupees will have to be obtained in order to get a pound. Well apparently it seems that more commodities should be sold to get fifteen rupees in the country in order that the debt may be paid. But the question is that because prices will have risen, therefore the result will be that probably the same amount of goods will be sold or even a lesser amount of goods will be sold to realize the price. Therefore India as a debtor country will in no way be suffering but it might gain.

5263. How would it gain? I do not follow that?—If the debtors in the country itself are to sell less commodities in order to pay off their debt, by the rise of prices,—to-day, if there is a rise in prices, naturally I will be selling less commodities to get the same amount of money.

5264. Are you referring to a rise in internal prices or external prices?—From the rise in internal prices we are going to the rise in external prices.

5265. And do you suggest that by reducing the exchange value of the rupee India will raise external prices, the gold prices abroad?—It cannot raise gold prices in that way. There will be an appreciation in the price of gold, which means there will be a fall outside, because we will demand more gold, there will be appreciation in the price of gold, and there will be a fall in prices outside.

5266. We could leave out the question of the demand of gold from this argument because the reduction in the value of the rupee which you propose could be equally well effected under a gold exchange standard without bringing in the question of a gold currency. For external purposes also; we are exporting from here agricultural produce and commercial products? Well the unit of value being the rupee for the masses, they merely evaluate all their needs in rupees. They will be selling less crops for obtaining the same amount of rupees. It is when it comes through the hands of the exporting firms that they deal with foreign countries. The masses having the rupee for the present as the unit of value, will be selling less commodities internally of course for getting the same amount of rupees. Therefore when we come to the question of the debts of one country to another, it has to be seen whether we are selling less commodities or more commodities. I think we shall be selling less commodities to give the same amount of interest or to pay off the same amount of debt.

5267. You suggest that although foreign prices have not risen, foreign countries will be prepared to accept a lesser amount of commodities in discharge of your foreign obligations?—When our prices have risen, on account of the sympathy of the market, the prices of commercial products will also go up; we have a monopoly in several things, such as jute, tea and skins and seeds. Thus on account of the general rise in the level of prices, the foreigner will be paying

more prices. The prices of these commercial products and crops are to be settled by the conditions which are prevailing in our country.

5268. You mean then that by reducing the value of the rupee you will be able to force up prices abroad?—To some extent we can. A crisis in one country can either raise the prices or bring down a fall of prices in other countries. The world is linked together in these days.

5269. One other question, Dr. Balkrishna; you have given a glowing account of the stimulus to trade and industry that arises from a rise in prices. Would not the same effect occur in a gold using country from a fall in the value of gold?—It will.

5270. And all gold using countries will, therefore, benefit from a fall in the value of gold?—Yes.

5271. Now turning to your memorandum (Appendices, page 223) in which you discuss the effect on the world of a possibly large absorption of gold by India, you say "the introduction of a gold currency in India by arresting the fall in the price of gold will do a real good to the whole world." Could you explain that apparent discrepancy with your previous argument?—Yes; the prices on account of the war and other causes after the war, have risen to such a high level that those countries which have got these high prices will suffer more if there is a rise in the prices which are already on the peak; Germany, France and even United States, all of these have got high prices and it is better for them that those prices should be reduced a little.

5272. But the argument was, was it not, that the rise of prices produce cheerfulness, buoyancy and so on?—But there ought to be a limit for these. If these prices have to be approached to the gold level, there ought to be a great deal of deflation and also therefore a fall in the price of the commodities. But that can be brought about only by the adoption of a gold standard by these countries or if the conditions do not allow them to adopt a gold standard, India should come forward and adopt a gold standard and thereby relieve the pressure on those countries. That is the gist of my argument.

5273. Then perhaps I should be right in summarising your position as advocating a small dose of inflation but not too much of it?—Yes.

5274. (*Sir Purshotamdas Thakurdas.*) In replying to Sir Reginald Mant, you said that in your opinion 1s. 6d. sterling to-day was equal to 1s. 4d. gold?—I do not know the actual rate now.

5275. Is not the sterling very close to the gold point to-day?—I think there was 6 to 7 per cent. premium. A few months back it was even 12 per cent.

5276. It has been round about 4·86 for some months now. It is very close to the gold point. If that is so, 1s. 6d. is not 1s. 6d. sterling but 1s. 6d. gold also?—It has been coming up. It may be a month or so; it has been coming up from July onwards.

5277. You are not in touch with the latest quotations?—I say it has been coming up. My impression is that before July there was a depreciation to 10 or 12 per cent.

5278. You do not know what it is now?—No.

5279. Can it be said at present that 1s. 6d. is 1s. 6d. sterling and it represents gold also?—Of course if the price of sterling is equal to gold, it will be that.

5280. In paragraph (9), (Appendices, page 217), you say, "This can be done by issuing sterling notes." What do you mean by "issuing sterling notes"?—The word "sterling" is used loosely. It should be "gold."

5281. You would like the word "gold" to be substituted for "sterling" there?—Yes.

5282. (*Professor Coyajee.*) As regards the point put by Sir Reginald Mant to you, don't you think that the ultimate exchange is between goods and goods between two countries and that the ratio of 1s. 4d. can be of some benefit to the exporter only temporarily, until the prices adjust themselves to the new ratio?—Yes; it will be.

5283. Temporarily there will be some benefit?—Yes.

5284. Then there was another point. In your memorandum you have argued that by bringing the gold standard reserve and the paper currency reserve to India, our industries could be assisted. You added that the Imperial Bank should hold foreign bills in order to control the foreign exchange. Then what would you do with the gold standard reserve?—Some of it will be employed in buying Indian securities and some amount will be utilised in foreign securities and the rest can be in liquid gold.

5285. But so far as the Imperial Bank holds an equivalent amount in foreign bills, that will also help to finance foreign trade?—In every country we are doing that.

5286. What kind of help, assisting foreign trade?—To some extent. But we have to take other things also into consideration; when we have got the gold standard with gold in circulation, other countries will have to buy our securities to pay off our debts. Then the gold securities will be interchangeable and as we are a creditor country so far as our exports are concerned, they will be more eager in buying our securities than we will be. I think we will be in a better position to hold in that way less foreign securities than our securities will be in the hands of the foreigners.

5286A. That is true; but that is irrespective of whether the gold standard reserve is in India or we hold our bills on foreign countries. They must be holding our securities already.—Now we have these rupee securities; at that time we will have more or less gold securities.

5287. What I mean is this: Uniformly they must be holding bills on us?—Yes.

5288. They must be holding them even now?—Yes.

5289. (*Sir Rajendranath Mookerjee*): You say that by substituting for the present ratio the ratio of 1s. 4d. the prices of commodities will increase?—Yes; there will be a tendency for that.

5290. And the agriculturists will gain?—Yes.

5291. Now among the agriculturists, there are many who have very small holdings and whatever they produce, after providing for their own necessities, leaves a small margin for outside sale. Therefore whatever profit they make by selling the little portion of their produce will go to compensate the loss they will incur by having to purchase other necessaries of life at a higher price, such as dhoti, fish and so on which they do not produce. Do you agree with that?—No, I do not agree.

5292. Will you please explain why you do not agree?—We know that many villages are self-sufficient. Little of the foreign cloth or even the cloth which is made in our mills at Ahmedabad and Bombay is consumed by our villagers. They produce their own cloth and, for the present, the tendency on account of the Gandhi movement is to use indigenous cloth. So this movement is making them self-sufficient. There was a tendency for that self-sufficiency to be broken, but now I find that on account of this movement when cloth is to be produced in each village, they do not require much cloth.

5293. That is the future. But at present the agriculturists cultivate their land. They turn out a certain produce, mostly food crops. After they provide for their food, they have a very little to sell to outside people. That much you admit?—Yes.

5294. They may get a higher price if we fix the ratio at 1s. 4d. But though they may get a little higher price, it is not sufficient for them to buy other necessaries of life?—We have to find out in each case the ratio of the money spent on them, on things which they buy from elsewhere and also the ratio of the produce they sell and then we will be able to find the profit.

5295. Generally speaking, they have got small holdings, 1 acre, ½ acre and 2 acres?—But they are at the same time paying part of the produce to the zamindar. That is half of the produce or nearly ⅓ of it they pay to the zamindar and he will be selling it.

5296. Are you quite sure that even that little profit they make does not go to the money lender or to the

middleman?—No—They will sell less produce to the money lender.

5297. So that the profit goes to the money lender and the middleman?—No.

5298. I leave it there. Reverting to what the Chairman and Sir Reginald Mant asked you about, you state in your memorandum that the falling rupee is favourable to India as a debtor nation. Again you say (Appendices, page 220): "India has been a creditor country and it shall remain so as far ahead as we can see." Will you explain in which sense you use the words "debtor and creditor" here?—Debtor in the sense of Home charges only; because there is no other debt to be paid; and also the debts that the Government raise for productive and unproductive purposes. Debtor in the sense of home charges to be paid annually for the Home Government and secondly in the sense that debts have been raised by Government for productive and unproductive purposes just as every Government has got some debts. In these two ways we are a debtor nation. We are a creditor nation in the sense of trade, or foreign trade. Our exports are always more than our imports; so in that way we are a creditor nation.

5299. So we gain both ways, without being absolutely either a creditor or a debtor, according to your theory?—Yes. It has to be seen what is the proportion between the debts and credits.

5300. (*Sir Maneckji Dadabhoy*): Dr. Balkrishna, in answer to the Chairman you stated that the currency of the country should not be looked upon only from the foreign exchange point of view?—Yes.

5301. Now, you know that India is a country of raw materials and is under the necessity of exporting her surplus produce. Do not those considerations make it impossible to avoid the considerations of the foreign exchange as a material factor in our economic history?—No, Sir, my words are foreign exchange should not be given predominance. That is the idea.

5302. That is different. You now say it ought not to get predominance?—That is the note underlying the whole of my memorandum, that the policy of the Government has been more or less based on the stability of foreign exchanges. I say it should not be so; it should be based on internal prices. Therefore it is a question of predominance and the relative importance that is given to foreign exchanges.

5303. I see your point. Then you want to settle the ratio so far as internal prices are concerned?—Not that alone. I do not say that we should ignore the foreign exchange altogether. We should of course have in view the question of the foreign exchanges too; but more than that we should pay attention to the stabilisation of internal prices and to a sound currency system by which of course this end can be achieved.

5304. Then so far as foreign exchange is concerned, you want to leave it to natural conditions, to adjustment of trade; that trade should adjust the ratio?—Yes.

5305. From time to time?—Yes.

5306. And you think that the adoption of the gold standard may stabilise the exchange to a certain extent?—Yes.

5307. That is how I understood you. Now during the interval we have also to make our Home remittances and charges. On the basis of what ratio will those remittances have to be made and how will they be made?—The basis will be the rate which is fixed in the market between gold and silver as it has been going on up to now. The Government fixed the ratio at 2s. but that ratio could not be kept up and the Government then left the whole thing to automatic causes.

5308. Then even in the matter of Home Charges it will have to be left to automatic causes?—I say it should be made through the Imperial Bank and therefore the Government has nothing to do with the fixing of the rate. It should be done only through the banks and that means natural causes will come into operation.

5309. But the Government of India in framing its Budget will have to adopt some ratio; otherwise how can it adjust its balances?—I see there will be some uncertainty in the framing of Budgets, but of course it is impossible to remove the whole element of uncertainty when you leave the rate to natural causes. That inconvenience will always be present, especially during the interim when the ratio is fixed at 1s. 4d. I think, as I have already said, on account of certain causes the ratio will hover about 1s. 4d. Therefore the Government can make provision for the variation of the ratio: it may be to 1s. 5d.

5310. No, but the Government has to adopt some definite figure in its Budget, either 1s. 6d. or 1s. 5d. or 1s. 4d., otherwise Indian finances will be in a state of chaos. So if you leave it to automatic causes and conditions to work out the destiny of the ratio what will be the position of the Government of India in the matter of its Budget formation?—Well, it will have to make up for the losses with a supplementary Bill; there can be no other alternative here. When we leave the thing to automatic causes we cannot divine what will be the rate at any time. If we fix the rate at 1s. 4d., the Government will be framing its Budget at that ratio; and if the ratio fluctuates adversely and the Government sustains a loss, naturally it will come up to the Assembly and ask for more grants.

5311. Then if it is to be left to these automatic conditions, will you please let me know how long it will take for the automatic forces to bring the ratio down to 1s. 4d. Have you made any estimate of the time?—I do not think any one can divine the effect of these forces. It is very difficult because if the gold standard is adopted by Germany or by some other countries, such as Australia, the appreciation in the price of gold will be very high and probably the rate may come up to 1s. 4d., and then as I find the production or output of gold also is being lessened the price of gold will go up to some extent on account of that cause too. But if the Central European countries do not adopt the gold standard, the price of gold and silver may remain divorced from each other for a long time. Therefore there are so many causes which are uncertain in their nature that any estimate of the time to be given as to the fixity of the ratio as 1s. 4d. will be impossible for us to make.

5312. Then would not during that interval there be dislocation to a certain extent?—In foreign exchanges for the remittances of the Government?

5313. Yes?—Yes, there would be and the Government would be on the same basis as the merchants. The merchants are dealing with these things say up to the extent of 4 or 5 hundred crores of rupees, while the Government has to remit only 30 million pounds. It will be placed on the same level as the merchants of the country; it will not have to suffer more. Merchants as a community will be also liable to that fluctuating rate and in every country they are liable to that fluctuating rate; what if the Government is in the same position as the mercantile community?

5314. Will this fluctuating exchange then in your opinion have any effect on internal prices?—It is a very complicated phenomenon. There must be some effect of the fluctuating rate of exchange, otherwise there is no use in saying there should be fixity. These exchanges and fluctuations must have their effect on internal prices, otherwise why should we try to fix the ratio at 1s. 4d. By reducing the rate you are having an increase in prices, and by raising the rate you will have a fall in prices. Therefore it means that internal prices are linked to some extent with the foreign exchange. But as every one of us knows the phenomenon of prices is so very complex that we cannot say that this cause is more important than the other. This much I can say, that the internal prices are linked to some extent to the foreign exchanges.

5315. Will this policy of non-interference be on the whole to the interest of India?—I think so.

5316. (*Sir Henry Strakosch*): Professor, I should like to ask you a few questions with regard to a statement which you made with reference to the amount of gold needed to put your plan into operation. When I

speak of your plan I mean the plan in 1928 of converting the token coins, be they notes or rupees, into gold. You told us that you thought that as the European countries held a matter of 14 to 35 per cent. of their note circulation in reserve, a similar ratio might be applied to India?—I did not say similar, not exactly the same ratio. I said that gives us the basis for estimating the gold that will be necessary for us. That will be the mimimum rate which must be required and Indian conditions will require more.

5317. They will require more? At what percentage of the note circulation would you estimate the requirements?—If I am not wrong in my impression I think 35 per cent. is the present holding of the Goverment of India in liquid money to its own notes here. That has to be seen. Well if that is the case, in the first few months we shall require a large gold reserve; I think 50 per cent. will be necessary in the first six months; afterwards normal conditions will prevail and we can come down to the same reserve as the Government is holding now. That is what experience has shown us.

5318. In that connection you probably follow the statutes of the chief Central Banks who are entrusted with the management of the currency in other countries, and you probably know that the minimum reserves to be held by, for instance, the Central Bank of Germany, the Reichsbank, is about one third of its note issue, that the Federal Reserve system 40 per cent. of its note issue?—Yes, Sir.

5319. I do not quite appreciate why you say that in Europe notes were covered before the War by 14 to 35 per cent. of gold. I am telling you the minimum reserves?—No doubt so far as Germany is concerned, in France of course there is no statute, but in Germany there was; and when I said 14 to 35 I was also thinking of the English banking system and the ratio of the deposits against cheques, I mean against the cheques they have issued and the notes. The 14 per cent. of course refers to the reserve against notes as well as cheques. In certain banks, for instance, the result came to only 14 per cent.; in others a little more and in others higher still.

5320. But have you not got to take the percentage of reserves held by the Bank of England and not by individual banks as a measure?—Well that is a banker's Bank. Naturally it must have a large reserve; it must hold a very large reserve. I have referred to what the banks themselves are holding.

5321. But these banks can go to the bankers' bank and discount their bills at any time and procure currency and credits with the Central Bank. Haven't you therefore really got to estimate the position from the balance sheet of the bankers' bank? —Yes we have to; therefore we can find out the ratio in the other way. The bankers' bank, that is, the Bank of England's reserve only will not be the right guide because that is the maximum amount held. On the other hand, the banks' reserves will be the minimum. So we have to find out a ratio which will lie between the two, the reserve in the Bank of England and the reserves in the other banks.

5322. But if those other banks hold their reserves as balances with the Bank of England, would you not then say the return of the Bank of England is the only guide?—Therefore I am saying that is the maximum limit; the reserve in the Bank of England is the maximum; while the reserves in the other banks will be the minimum, and between these two we can find out the true ratio to the note circulation.

5323. Would you be surprised if I told you that the Bank of England held in pre-war days about 50 per cent. of its liabilities in reserve and equally the big central banks of gold standard countries?—There is special consideration to be given to that point of the 50 per cent. reserve in the case of the Bank of England; it is not only the financial conditions of England which have to be looked to; but London being the financial centre of the world and having to make payments through its financial machinery to nearly all the countries of the world, it had to hold a very large amount of reserve for that purpose. In the case of India, as she will not be the financing centre of the world and will not have so much banking business, we can therefore hold less reserves.

5324. But what is the purpose for which you hold these reserves?—For converting notes into gold and for foreign remittances.

5325. Exactly: I wanted to come to that. It is for foreign remittance that you are holding the reserve, and therefore if there is a possibility of these foreign remittances requiring a large amount of gold your reserve has to be proportionately high, has it not?—I have said that.

5326. Now, then, on introduoing a gold standard with gold in circulation you say you estimate that 50 per cent. cover of the note issue would be sufficient?—Yes.

5327. The note issue at present is 190 crores?—Yes.

5328. So that you would regard 50 per cent. of that as sufficient, which means 95 crores?—Yes.

5329. Now what liabilities have you got to meet with those 95 crores, on introducing your gold standard with gold in circulation? Would you give me the headings of the liabilities that have to be met out of that reserve of 95 crores?—Notes to be redeemed, rupees to be redeemed; and at the same time the payment of foreign remittances; these will be the three headings, I think. Redemption of notes, redemption of rupees, and remittances.

5330. In order to weigh to what extent you will require to trench upon your gold reserves, you have to know what amount of rupees are likely to be tendered for conversion?—Yes.

5331. And to estimate that you will have to know how many rupees there are to be converted?—Yes.

5332. Do you not think it is necessary to know that very precisely?—I have said in my statement, when I was giving oral evidence, that the latest estimate of the rupee circulation is not with me and therefore I could not give that in the memorandum to form an estimate.

5333. How then do you come to the conclusion that 95 crores would be sufficient?—As I said, there are 75 crores in the reserves in London; there is another sum of 20 crores in the form of gold reserve in India, giving a total of 95: with a two years' interim which will bring in more gold, I said that at tho rate of 25 crores I take it to be 50 crores; so that in all it would be 145 crores, not 95 crores.

5334. Let us take your figure of 145: why do you say that that will be sufficient, if you do not know the number of rupee coins that may be presented for conversion?—We have got the estimate of 1911 or 1912, I think, so far as that estimate is concerned. That will be more issue for the present, and therefore it will be merely a vague statement, even if we make any rough estimate on the basis of the estimate of 1911, because so much more money has been coined after that.

5335. But we have to make an estimate to-day?—Yes, of course you have to.

5336. It is a very responsible task to undertake to promise to convert your token currency into gold and not be prepared for that, and therefore we should like to get enlightenment as to the amount of reserves that will have to be accumulated before you can undertake that?—I had made an estimate of that; unfortunately it is not with me just now; it was an estimate from the year 1850 to 1925 of how much silver has been imported into the country, and giving a 5 per cent. depreciation on it per annum, not one or two per cent. as is done in other countries (I shall give the reasons for that later if you want); but on that depreciation of 5 per cent. per annum we come to a certain figure, that in 1924 we have got so much silver in the country and some of it must be in the form of bullion while the other must be in the form of rupees. In that case

I take it half and half, that is to say, roughly speaking, half in the shape of bullion and half in the shape of rupees. I made out that estimate and I shall send it as supplementary information if you want it.

5337. Yes, that will be most valuable, but I do not quite appreciate your point that you have to reckon 5 per cent. depreciation per annum: you mean 5 per cent. of the rupee coin in circulation?—Not rupee coin: silver imported into the country is what I am saying. 5 per cent. is the consumption per year, consumption in the weight, which is wasted and goes out of existence.

5338. Five per cent?—Well, I will give my reasons for that. In other countries we know that the wear and tear is taken at one to two per cent.

5339. I am not aware of the figures?—One to two per cent. is the wear and tear of currency so far as rupees are concerned. I am here talking of the consumption of silver imported into the country and therefore finding out how much stock of silver there is in the country.

5340. You mean actual loss or disappearance?—Yes.

5341. So that, putting it in a different way, silver disappears completely in twenty years?—Yes, according to me.

5342. The silver which has been imported into this country disappears in twenty years?—That is my view; I will give my reasons: The wear and tear of coin of course is quite well known. But we are using silver as well as gold for medicinal purposes, as well as for plates and ornaments. A very large amount of gold is consumed in the shape of ornaments; and these ornaments and plates are melted and re-melted; fashions are changing very often; the women-folk are not satisfied with the old ornaments and they have new ornaments made and therefore there is in that way a great deal of wear and tear. You will find that from the year 1851 to 1900, nine-tenths of the silver that was imported into the country was coined, and passed through the mints. In that case it seems to us that one-tenth has been used in the shape of bullion, that is, for medicinal purposes, ornaments, etc. But it also appears that rupees were used for ornamental purposes. There is therefore of course a great deal of depreciation or loss of silver when we use it as ornaments and plate. The higher classes are using silver in the shape of plates, cups and saucers and other things such as hookahs, etc. For medicinal purposes also we are using silver and gold which means a good deal of consumption. Therefore taking all these things into account I think there is a great loss and that is why I have fixed the rate of depreciation at 5 per cent. instead of 2 per cent. for wear and tear.

5343. (*Chairman.*) You referred to the basis of an estimate which you had compiled. If it is convenient to you to let the Commission have it in the form of a supplementary memorandum it will no doubt be of interest to them?—I shall do so.

5344. (*Chairman.*) On behalf of my colleagues I must express our thanks for the very full assistance you have given us this morning.

(*The witness withdrew.*)

Mr. J. A. WADIA, called and examined.

5345. (*Chairman*).—Mr. Jamsetji Ardaseer Wadia, you have been kind enough to come and help the Commission this afternoon, and you have also been good enough to provide us with a very full memorandum* of your preliminary views on the questions submitted to us for reference. Let me ask you, just for the sake of our record, in the first place, from what aspect you view these questions, from the point of view of the business man or from the point of view of the student?—More in the interest of India as a whole, not my personal interest. From the point of view of my personal interest, I would favour a very high exchange.

5346. But your actual experience has been that of a man of business?—Yes.

5347. Engaged in business in Bombay?—In the manufacturing business in Bombay.

5348. In the cotton trade?—Yes.

5349. From the point of view of a manufacturer or merchant?—No, I have been a promoter and Director of about 12 or 13 companies, having about 12,000 looms under their control.

5350. I propose to ask you a few questions to elucidate the opinions expressed in your memorandum rather with a view to seeing where particular emphasis is to be laid and of clearing up any points that seem to require clearing up?—Yes, Sir.

5351. In the first place, there is a very interesting point of view expressed in your memorandum that there are advantages in the free coinage of silver. This is summarised in the last paragraph of your memorandum, in which you say:—"If that (*i.e.*, gold currency) is not allowed to us on account of the monetary interests of London, then I would prefer an open mint to silver. Silver or gold currency must be honest"?—I say that.

5352. In the event of it being for any reason impossible for India to obtain a full gold standard with a gold currency, to all other systems you would prefer the free coinage of silver?—Impossible for what reason?

5353. Is it relevant to ask from what point of view it is impossible?—Then, what I say is if that is not allowed to us, I prefer altogether a silver currency. If you had not closed the mints, I would have been happy. That was the mistake made. Now that there is a possibiity of our having a gold currency, let us have an honest gold currency. If you cannot do that.

5354. The question I ask you as having a special individual interest and which you might enlighten the Commission upon is, what you think would be the effect, firstly, upon the trade and commerce of India, secondly, upon the standard of living and the prosperity of the Indian people as a whole, of a restoration of the free coinage of silver?—My ideal is this, that if we are to open the mints to-day, of course prices would be affected but not to that extent as you expect. You will see from the figures I have given you—they have been taken from the official figures— that when the mints were open and when your exchange was 23d. to the rupee and when it fell to 13d. to the rupee, food prices in India were practically not affected. These figures show that, and there is also the evidence tendered by Sir Anthony Macdonnell before the Fowler Committee to show that the internal prices were not affected. I have got his opinion in my pocket. I took it from his evidence before the Fowler Committee, and he says that the internal prices in India were not affected although the rupee in relation to gold fell from 23d. to 13d. I have just taken it down.

5355. When was this?—Before the Fowler Committee. "Apart from the dislocation caused by famine and bad seasons, the purchasing power of the rupee has remained pretty steady. There have been local variations, of course, owing to scarcity and so on, but apart from this the purchasing power of the rupee has remained steady from the middle of 1886 to the middle of 1896. In 1886 exchange was 1s. 6d. and then it went down as low as 1s. 1d. in 1894. In the 10 years from 1885 to 1895 it has had but very little influence." These are his own words which I have taken from his printed evidence.

* Appendix No. 27.

5356. What in your opinion was the reason why the Indian mints were closed to the free coinage of rupees?—It was absurd. The opinion was that the Government said, "we were not able to make both ends meet," and yet at 13d. they had a surplus in 1895 after closing the mints. Now you are taking from the country 45 crores more of direct taxation, that is, the Imperial Government, and I believe 45 crores from indirect taxes like the enhancement of railway charges and so on, and yet you are at wit's end.

5357. It was a fact, was it not, that during the last 20 years during which the mints were open to the free coinage of rupees there was a steady decline in the exchange value of the rupee?—Yes, which affected nobody but the English officials in this country who wanted to remit money home.

5358. Had that no effect on Indian trade?—It was expanding. If I, as a producer, for one sovereign pound of my cotton or wheat selling in the neutral markets of the world for one pound in 1873 got Rs. 11, and if in 1895 I got at the rate of 13d. Rs. 19, the country did not suffer—I did not suffer as a producer. I got more rupees. The Government of India in their report to the Home Government in 1886 acknowledged that. You will find that in the quotation from the Blue book. They said that the producers of the country benefited, they said that in plain words.

5359. You understand that if I ask questions intending, as it were, to examine the bases of your opinion it is only in order to reveal the opinion in its strongest form and that it does not imply any particular assumptions on the part of the questioner. I rather gather from what you say that you look upon the circumstance that there was a steady fall in the exchange value of the rupee as on the whole by no means detrimental to Indian trade?—Certainly not, the Government of India acknowledged it themselves in their despatch in 1886.

5360. Then would it follow from that logically that you look upon a continued fall in the exchange value of the rupee as conferring fresh and continuous benefits to India trade?—Well, there cannot be a continuous fall. There must be a limit. All I say is that you depreciated it artificially; that is a different thing.

5361. Where would you put the limit?—I do not know where I would put it. It is for the workers in the mines, it is the capacity of the mines. I could not tell you what the capacity and what the consumption would be. I say that India did not suffer by the mints being kept open for the free coinage of silver. The Government of India was inconvenienced for the time being, but beyond that inconvenience there was nothing to show that the Government of India or the Home Government were justified in interfering with our currency, and after interfering with it giving us neither gold nor silver. They destroyed our natural currency and they gave us nothing and for 33 years we have been fumbling about.

5362. You recognise that, with the free coinage of silver, if and so far as the market price of silver falls, exchange falls?—Yes.

5363. If and when exchange falls, I gather your opinion is that it is rather beneficial than otherwise?—Of course it is, and it is not detrimental to the import trade. If I make more rupees, I am able to buy more. But now what happens? Supposing the market price of silver rises, of course the exchange will rise, like the market price of any other article.

5364. If it is beneficial to India that the exchange should fall, is it detrimental to India that it should rise?—If it rises through natural causes, it would not be detrimental because the whole world will be on the same basis. All the silver-using countries will be in the same condition.

5365. We then arrive at the circumstance that the benefits are equal to India whether exchange rises or falls?—I do not think so. I think India is in a very peculiar position. The producer benefits by the fall, and if you raise the exchange the producer suffers, but if it rises through natural causes, of course there is nothing to be said. It is like the rise and fall of cotton or any other commodity or gold. Gold has appreciated and depreciated.

5366. You recognise, do you not, that as a standard of value silver is more variable than gold?—Silver, as far as the purchasing power of the coin was concerned, was a better metal than gold any day, until you closed the mints. As I show you, with silver at 23d. to the rupee and with silver at 13d. to the rupee, the purchasing power internally was not affected. Of course if I bought a bottle of champagne it would be different, but the internal prices as revealed by our own Blue book tell a different tale.

5367. Taking it in general, you do not see any disadvantage to India, either from the point of view of commerce or from the point of view of the economic advantages of the Indian people, that their standard of values should be one that would vary with the market price of silver?—I do not see any disadvantage at all. In fact that is the opinion; if you will read clause 34 of the last Babington-Smith Committee's Report they say that silver-using countries have prospered and can prosper with a fluctuating exchange; in clause 34 of their findings they say that. That is not my opinion, that is the opinion of the Babington-Smith Committee.

5368. I suppose the object with which the recommendation in the report of the Babington-Smith Committee was founded was, if it was anything intelligible, to establish the exchange value of the rupee at such a level that it would be independent of variations in the silver market? Was not that the object of their recommendation of the two shilling ratio?—I do not know what their object was; it was a very foolish thing, whatever it was. To try and stabilize the rupee in relation to gold when the whole world was topsy-turvy was one of the most curious things one could think of on the part of the Government of India. I believe, if you will allow me freedom of speech, the Government of India wanted a high fixity, and they thought, silver being high, of screwing up the rupee. That was what I think they aimed at in their heart of hearts. Of course they have failed.

5369. You refer to the Babington-Smith Committe's Report as supporting your contention as regards the relation between the price of silver and the standard of value in this country. Is it not the case that, whether ill-advised or well-advised, the object of that Commission in its Report was to select such a ratio for the silver rupee as to make its token value independent of the variations in the price of silver?—I suppose so, that they had that in view.

5370. So on the whole it shows that they were not adherents of that opinion which you express?—I do not express it, they express it in clause 34. Kindly do not attribute that opinion to me. I think they were quite right in their opinion.

5371. You recognize that by linking the rupee currency to the price of silver by permitting free currency, it would result in the circumstance that the exchange value of the rupee, and in consequence Indian prices, would vary with the silver market?—Yes, partly, not wholly; I have again stated that the silver fell to 13d. The internal prices were not affected. I have given the figures from the Blue books and I have quoted the opinion of a prominent member of the Fowler Committee and I cannot say anything more.

5372. Let me ask you one or two more elucidatory questions upon your memorandum. In quoting the Treasury, in the first paragraph of your memorandum, you say: "The proposal—(that is for closing the mints)—appears open to those objections to a token currency which have long been recognised by all civilised nations, viz., that instead of being automatic it must be managed by the Government and that any such management not only fails to keep a token

currency at par but exposes the Government which undertakes it to very serious difficulties and temptations." That of course was written before the event, was it not? If one looks back at the history of the rupee after the closing of the mints, did this policy, as a matter of fact, result in a failure to keep the token currency at par or did it not ultimately result in a substantial stabilisation of the rupee round about 1s. 4d.?—Yes; you succeeded in stabilising the rupee at 1s. 4d.; you also succeeded in destroying the purchasing power of the rupee internally. Because you will see from the figures that your food grain prices went up by leaps and bounds owing to your inflation and token currency. You destroyed our natural currency and you gave us token currency with the gold standard as you chose to call it and the result was that the food grain prices which were 114 in 1894, 117 in 1902 rose up to 199 in 1913 and 222 in 1914; but the English prices showed no such fluctuation. I have given you the English prices as well.

5373. When the mints were closed to the coinage of the rupee, that was followed by a period during which the Government made no further issue of rupees?—Exactly so; consequently there was no fluctuation in the price of food grains; they only rose from 114 in 1894 to 117 in 1904. Then you began to coin your token currency at high pressure and the prices began to rise.

5374. I am examining the effect of the closure of the mints from the figures which you have given us. I understood from your argument that there was no conceivable relation between the closure of the mint and the exchange. Is that not so?—No. What I say is that when you closed the mint and stopped the coinage, the prices were not affected except with a very narrow limit. Then you began to coin between 1900 and 1904 and you coined 50 crores of rupees. The country having been starved all these years of coinage, the currency was required. After that the prices were affected. My point is that you attained the stability. In exchange you destroyed the stability in prices. The result of all our present trouble was the destruction of stability in prices. We were obliged to pay higher wages. Higher wages means higher cost of production and higher cost of production means our inability to compete.

5375. But this is, I understand, subsequent to the date of which you complain against the currency authority in India and not the necessary and inevitable consequence of the closure of the mint?—I do not know; but by the way in which you closed the mint, you destroyed the internal economy.

5376. Have you calculated what would have been the effect of keeping the mints open?—I can only say that your exchange fell from 23d. to 13d. and your internal prices were not affected.

5377. The question I wanted to ask was this: Have you been able to calculate at all by means of reference to the actual price of silver in the market what would have been the effect if you had kept the mints open?—I cannot tell; what the price would have been if the mints had not closed it is impossible for me or any human being to predict because you have stopped the consumption of silver and the silver fell very low. What it would have been if the mints had been kept open at present, is the price of the rupee would have been 13d. I can tell you that. But it went much lower.

5378. If I may refer to the second paragraph of your memorandum, you quote an extract from the "Statist," a London Newspaper: "If the purchasing power of the rupee were raised by 20 per cent.,"—(this is at the time of the closure of the mints) "land tax and other taxes payable to the Government would likewise be raised"—(they were contemplating the possibilities and the consequences of the closing of the mints)—"so would all debts due at the time the change was made. In other words, every banker, capitalist and usurer would find his property so far as it has been lent out to others increased by 20 per cent." I should like to ask you if you feel able to make any calculation of what would have been the converse possibility if the mint had been kept open to the coinage of rupees?—If the mint had been kept open and we know very well that when the mints were closed and exchange fell from 1s. 4d. to 13d. we had a surplus; but if the mints had been kept open to-day and if silver was 13d. to the rupee, of course we would have required more rupees in taxation; but as it is you are taxing us up to the hilt with your 1s. 4d. You have taken 45 crores per annum from indirect taxation and put up 45 crores in direct taxation. Moreover my opinion is this: that we are a debtor country in one way and in another way a creditor country. But as a debtor country if we owe 20 million pounds or 30 million pounds, what I would call Home charges, to England or any other country in the world, your silver or gold does not affect the country at all. I am supposed to produce in India goods worth 20 or 30 million pounds which would sell in the neutral markets of the world. My exchange, either 1s. to the rupee or 2s. to the rupee would not be affected. I have got to produce goods. They would not recognise whether your rupee is 14d. or 16d. or 18d. The Government of India would be inconvenienced for the time being. But beyond that inconvenience and that has been acknowledged by the Government of India report in 1886, the people at large are benefited. I am sorry I have not got the quotation here. But I can give you the opinion of Sir Robert Griffin as to what the consequences would be in case with an open mint exchange fell and the Government of India were not able to balance their budget. Would you like to hear it?

5379. May I know what is your opinion?—I agree with him.

5380. If you agree with the opinion I am sure it will be of interest to the Commission?—I agree with him. We are giving our produce which in the neutral markets are valued at 20 or 30 million pounds. If you call a rupee 1s. or 2s. Government takes so much more money or so much more produce out of the pockets of the people.

5381. If I follow the point you are at present emphasising it is this; that the actual level of the exchange, when you consider India from the point of view of a debtor, is insignificant because the actual amount of its sterling debt has to be settled by the sterling market?—Yes.

5382. That is an opinion which the Commission is interested to hear, as it is different from other evidence we have heard to-day. Now let us look at it from another point of view. Let us look at it from the point of view of India as a great developing country, with great needs for fresh capital in order to develop its vast undeveloped resources; in fact I think we agree that one of the greatest of all needs in India is the obtaining of a bountiful supply of fresh capital. From that point of view, do you not lay a certain amount of emphasis upon the necesity of obtaining a reasonable, stable rate of exchange in order to remove from the path of those who are contemplating investment of fresh capital in India any doubts on the subject?—As to stability of exchange, I will tell you right off that it is a convenience.

5383. Convenience?—It is a great convenience; but I am not prepared to sacrifice the country for the purpose of this convenience, in the way in which it has been sacrificed for the last 30 years. If you had when you closed the mints, 1s. 4d. rate and had given us a gold standard and a gold currency as the Fowler Committee intended, the injury to the country would have been greatly reduced. But you never chose to do that and as to your saying about the capital which is required for industrial development, according to our Finance Minister India is rich enough to provide all the capital. He said that only the other day.

5384. Let us envisage that question, which is one of great interest. In your opinion India is sufficient to provide all the capital?—That is what the

Finance Minister says. He said so the other day to some people in Calcutta. He said that we were rich enough to provide all capital.

5385. That is an opinion which you endorse?—I am not prepared to say that. All that I say is this: that if you can give us a low exchange, say 1s. 4d., with a gold currency in a reasonble time, directly you say so, you will be satisfying us. A higher rate like 1s. 6d. I strongly object to.

5386. This is raising another question, is it not? We were thinking at the moment of the question of the relative advantages and disadvantages of the variability of exchange, but you are prepared to express the opinion that a stable exchange is beneficial from the point of view of investing capital?—Yes.

5387. Before I ask you one or two general questions there are a few points upon the memorandum which I want to clear up. You have told us already in your replies that, from the point of view of settling India's sterling debt, the rate of exchange is a matter which is not relevant?—Nothing at all.

5388 That opinion, if I may say so, is in accordance with what is actually considered as economic theory. But now you say in the last paragraph of your memorandum, "I do not see any use of examining this question again, except to squeeze the tax-payer by a high fixity for the benefit of the foreigner." How does that fit in with the opinion which you have just expressed? How does the high fixity squeeze the tax-payer for the benefit of the foreigner more than the low fixity?—It is very easy to account. Say my exchange is 1s. 4d. I have got to produce goods which will sell at 1s. 4d. in the neutral markets of the world. Now you raise the cost to 1s. 6d. I have to produce cotton as much as what it will fetch 1s. 6d. That is, I have to pay you 2d. more in goods; that is where the squeezing comes in.

5389. Then the absolute level of exchange is relevant in considering the burden of the sterling charges?—Of course.

5390. I gather from your last reply that when your mind turns to this paragraph in your memorandum you find that the absolute level of exchange, whether it is 1s. 6d. or 1s. 4d., is relevant as to the raising or the lowering of the burden of India's foreign charges?—Of course. Suppose your mints are open. Suppose you pitch at 1s. 4d. and your exchange goes down to 1s. 2d. There is a loss of 2d. but the loss is only loss to the Government. To the country it is not a loss at all. The country has saved 2d. It has sold less goods. This is a remission of taxation lowering of exchange. I would like to read Sir Robert Griffin on that point, if you would like to hear it. That is a point which the Fowler Committee did not take in very easily. Giving evidence before the Fowler Committee he said: "It (i.e., the fall in exchange) is a remission of taxation in that the community of India does not contribute the produce if the taxes remain the same. Until you make the change the people of India do not contribute the produce. The Government is short of so much produce. But what I say is the people of India have it."

5391. That pronouncement is perhaps not wholly free from obscurity in expression?—No, it is not obscure at all, because if the exchange goes from 1s. 4d. to 1s. 2d. the Government of India is short of cash, say 5 crores worth of produce. The people have it for the time being till you raise your taxation. That is what he means and that is quite clear to me.

5392. You are on the point now, as indeed we both are no doubt, that if you reduce the rate of exchange then the Government of India has got to increase its taxation?—If you have to lower it?

5393. Yes?—Oh yes, of course.

5394. Let us take that point. Supposing you were to effect a reduction of the present rate of exchange from 1s. 6d. as it stands at present in the market to 1s. 4d. Have you estimated what the effect of that would be upon the Budget of the Indian Government?—Yes, they would have to produce more rupees. But what I want to impress upon you is this. It is their meddling with the currency, giving us a token currency and inflating prices, compelling them to pay higher wages to their employees and higher wages mean higher taxes; it is owing to that meddling that they are in this muddle. I am myself in easy circumstances. I used to employ my servant for Rs. 10 a a month, the very man I am paying Rs. 25 to-day. It must be the same with larger employers of labour. If they pay more they must raise more money by taxation. They first inflate the currency; that is reflected in prices; high prices mean high wages and high wages mean high taxation.

5395. The specific evils to which you refer are the evils of inflation by the Government of India?—That is it.

5396. To follow up that line of thought, I understand you recommend the ratio of 1s. 4d.?—1s. 4d. with a gold currency; no more token currency without limit.

5397. In any arrangement as to the final standard of currency, would it in your opinion be possible to return to the ratio of 1s. 4d. from 1s. 6d. without such an increase in the volume of currency medium as would actually be in the nature of a further inflation? I mean, a critic who had been listening to the development of your argument might say you complain of inflation as the greatest of evils; you desire a return to 1s. 4d.; a return to 1s. 4d. is impossible without further inflation?—Why should it be so unless you give us silver. Give us gold, give us a gold currency and there will be no inflation. Your silver is simply a metallic note.

5398. By what steps would you propose to reduce the ratio from 1s. 6d. to 1s. 4d.?—And also gold currency directly? It is possible to do so. The steps should be taken at once without giving anybody any notice. As you closed the mints without giving anybody any notice, reduce the 1s. 6d. ratio to 1s. 4d. without giving anybody any notice. If you give anybody notice they will be gambling; everybody will send money to England at 1s. 6d. and bring it out at 1s. 4d.

5399. What would the practical procedure be?—The same procedure as you adopted in closing the mints. That is to say, declare you will maintain the 1s. 4d. ratio. You maintained it for 20 years and there was no reason why you should have gone to 1s. 6d.

5400. You would declare that the rate is to be 1s. 4d.?—Yes; with gold currency.

5401. I am trying to ascertain how the question of gold currency would affect the rate. You would declare the rate to be 1s. 4d.; then what further steps would you take?—Then you should within as short a time as possible put us on a gold basis; put us on a gold basis at once; and I may tell you one thing: before the Fowler Committee Lord Rothschild was asked what would be the amount of gold required for an effective gold currency and he said 20 million pounds sterling. But then our currency was as regards coinage 130 crores; as regards currency notes it was about 26 crores; so for 130 crores of rupees in effective circulation and 26 crores notes he said we would require 20 million sterling. Now things have changed. You have inflated your currency. Your rupees are supposed to be 235 crores and your currency notes are 180 crores or in that neighbourhood. How much gold you should accumulate before you can declare convertibility it is for you to judge.

5402. That perhaps raises another issue to which I should like to refer in a moment. I am referring to the present state of affairs. Under the present system of purchasing foreign exchange in the market, the ratio stands round about 1s. 6d.; and I am contemplating that your recommendation is adopted. If the Government declares that the ratio is to be round about 1s. 4d. perhaps you might agree that the immediate result of that announcement on the market would be that dealers in exchange would very soon knock the rate down to 1s. 4d.?—Yes, at once.

5403. Supposing no further measures were taken in order to keep the rate there by way of letting out

currency, would the rate be likely to stay there or would it not recover to 1s. 6d. as the result of speculative operations?—No, I do not think it will recover at all. You see you can take the exchange up to anything you like as long as the balance of trade is in India's favour; to 1s. 6d. or even as high as 1s. 8d. because you are the seller of rupees and if I am a banker and I want a crore of rupees I can only come to the Government and say "Give me rupees." Then they will say "We can only give you at 1s. 6d." So long as the balance of trade is in India's favour; you can reduce the balance of trade but you can maintain the rate.

5404. Ultimately the rate will be decided by the relative supply and demand of the two currencies, the internal and external currency?—Yes, if there was no monopoly in the rupee of course it would be; but you have created a monopoly. Suppose you give me a monopoly of salt and say sell salt at 1s. 4d., and then I say I can take it up to 1s. 6d., I can do that; there is a monopoly in a very necessary article and when you have a monopoly you can take the price of the article as high as possible.

5405. Let me ask you to assist us in regard to what your proposals are for the introduction of the gold currency. What measures would you take in order to secure that end?—Accumulate gold, that is all. You have got gold, I believe 40 million pounds is now in the gold exchange standard and you know what your currency is.

5406. You have undoubtedly a certain number of these amounts to which you refer in the reserves; would you accumulate a bigger reserve?—Necessarily. I am only giving you the opinion of Rothschild that 20 millions would be enough at that time. We have to double and treble that and I think we should have 60 million pounds in gold.

5407. How would you accumulate that additional amount, whatever it may be, in the reserves which are required in order to effect the change?—He recommended 20 million pounds to be raised by loan. I do not know how it is to be accumulated; that is more for the Government of India and its expert advisors. If they are going to give us a gold standard and a gold currency they ought to have thought of that.

5408. Undoubtedly the expert advice of the Government of India is a very essential contribution. I hoped perhaps that you might have considered some suggestions?—What suggestions can I make? Here I give you the opinions of some great men who are financial experts. Lord Rothschild also said that the maintenance of the exchange depended upon exports and if you have a high exchange your exports will be interfered with.

5409. Supposing that by some means, advised by the appropriate experts of the Government of India, you have accumulated sufficient reserves to contemplate the obligations of the introduction of the full gold standard, by what measures would you carry out the transition from the present arrangements to a full gold standard and a gold currency?—Well, we were before the War getting enough of gold; enough gold was in circulation; and from the Moral and Material Progress Report for India for 1911-12 you find in one of their paragraphs, I have got the paragraph with me, the Government say that gold is very much appreciated by the people and is more in use than silver. You need not undertake to give gold for 15 rupees but you can go on giving gold as before and when once people know gold is obtainable there will be no hoarding or very little hoarding.

5410. I will come to that question in a moment. In the first place, we have to contemplate making practical recommendations as to what the actual measures should be by which such a change as you suggest should be carried out. I wonder if you could give us any assistance as to that?—I could not give any assistance beyond what I have said.

5411. Finally, on this very interesting point which you have just raised, you told us that gold is very much appreciated by the people of India?—I do not say so. The Government of India say so in their Moral and Material Progress Report. I think I can give you the paragraph. I need not read it out to you. I got it only this morning, although I had read it before. It is at page 167.

5412. What is the document?—The Moral and Material Progress of India: it is a ten-yearly report.

5413. I think it is made annually covering the previous ten years?—Yes.

5414. (*Chairman*): This is for the period ending with 1911-12. It says on page 167 "The net addition to the silver currency was about 61 crores. Excluding currency notes (7·56 crores) the total absorption of currency amounted to over 20 millions sterling in value, the latest estimate of the total number of rupees in circulation being 180 crores, while gold and currency notes may be put at 60 crores each. The figures indicate that during the year the growth of the circulation of silver did not keep pace with the growth of the circulation of gold and currency notes." That is a very interesting comment upon that period.

5415. (*Sir Purshotamdas Thakurdas*): May we know to what period it relates?

5416. (*Chairman*): The ten years ending with 1911-12.

5417. (*Sir Purshotamdas Thakurdas*): In that report, where it talks of "the previous period," it means the period ending 1899-1900?—I could not tell. I copied it verbatim. Perhaps it refers to the ten previous years.

5418. (*Chairman*): The report says that during tho year the growth of the circulation of silver did not keep pace with the growth of the circulation of gold and currency notes: is this in your view the general tendency?—That is what the report says.

5419. That raises, from the point of view of this discussion, a very pertinent and relevant question as to whether the cause of this slight increase in the growth of circulation of silver was the increase in circulation of gold or the increase of circulation of currency notes. Perhaps you can tell us which it was that was increased in circulation. My impression is that it would have been currency notes that increased in circulation?—No, it says both.

5420. It gives us no guide as to which was the predominant factor?—The present tendency in India, when you import treasure, is for more gold than silver. People have more predeliction now for gold.

5421. That is just what I wanted to ask you about. We recognise of course that, since the establishment of the 2s. ratio, it has been impossible for gold to go into circulation?—The 2s. ratio has broken down long ago; it is only on paper that the 2s. ratio exists.

5422. In your opinion has the 2s. ratio no effect upon the question of circulation as between gold and currency notes?—I could not tell that. The 2s. ratio did not last long; it only lasted long enough for the exchange banks to make money and some rich people; that was all; it lasted for their benefit long enough; money was never made more easily.

5423. As regards the general tendency, in your opinion has there been any tendency during the periods in which it has been possible for gold to go into circulation for gold to be accepted in circulation?—Yes; we all like gold: I used it myself; we all like gold.

5424. Can you refer us to any figures which indicate the increase of figures in gold and notes?—I could not tell you; but I think there are Government figures available.

5425. Generally speaking, we have had a good deal of evidence as to what one witness called the impossibility of satisfying the demands of the people of India for gold to keep as a store of value in hoards. Do you agree that there is such a strong and permanent demand on the part of the people of India for gold to be kept, not in circulation, but as a store of value?—Yes; but the Babington-Smith Committee held that they were not importing more gold than was absolutely necessary for their domestic requirements. India is rather a peculiar country; even a poor man, though he may starving, or even without clothes, will have a trinklet; when his

children marry or are engaged or when he takes a wife to himself, there is always a little present of gold or silver.

5426. Is that the principal requirement of India for gold?—Yes; that is their savings and they prefer it very often to the savings bank.

5427. What would be the effect supposing gold was made freely available?—I do not think it will have any effect at all. I think that the Fowler Committee or the Babington-Smith Committee said that if they want gold they will have gold, whether you give them in the shape of gold coin, sovereign or bullion or ornaments; they will have gold.

5428. Finally, two general questions. Have you been able to calculate by what amount it would be necessary to increase the supply of gold in India in order to carry out the recommendations which you make as regards the establishment of a gold currency? —I have told you what the figure given by Lord Rothschild was when your currency was of a certain volume; it would be a matter for calculation; but I think if you once declare your fixity and say that in the course of a very short number of years you will have an effective gold currency, I think you will be able to manage it without much difficulty. The great thing is to give confidence to the people. They have no confidence now. They do not know what you will do. We have had several committees; they all fixed it at 1s. 4d.; and now they find all of a sudden it is raised to 1s. 6d.; and that has been going on for the last thirty-three years. It is rather a sad thing for me to contemplate that in a big country like India with such an enlightened Government, so many committee reports are required.

5429. These are the principal questions which I wanted to ask you in chief. I am very much obliged to you for your replies. Would you be kind enough to deal with any supplementary questions which any of my colleagues may care to ask you on the questions which we have raised, or is there anything you would care to add?—No; I have got nothing to add; but I would like to say one thing, and that is this; I have been sometimes told that a high exchange has been given to us for our benefit, while countries like France and Italy are struggling for fixity and they are very much troubled with the depreciation of their own currency. All that I want to say as to that is that there is no comparison between India and those countries. Their inflation is caused by war circumstances and their not being able to balance their budgets, and their depending upon the printing of notes and creating an inflation artificially. We created that war inflation simply through ignorance. We had a natural currency and it has served us very well. You thought of giving us gold because we were connected with Great Britain and Great Britain was on a gold basis and you thought that it would do us good too. You gave us gold nominally, but we were on a silver basis throughout. When it suited you you called the rupee a token coin; when it suited you you made it a standard coin. What I want to say is that there no comparison.

5430. Let me try and clear that up. When was this difference of policy inaugurated as between calling the rupee a token coin and a standard coin?—It has been called a standard coin all through; it was only a token coin in name; directly you ceased to give us gold it became a standard coin.

5431. When "we" ceased to give gold,—that is Great Britain?—No; the Government of India.

5432. The Government of India ceased to give India gold: what period in the history of Indian currency are you referring to?—After the war; up till 1914 we were all right; we had gold when we wanted.

5433. What is the material difference in present conditions as distinguished from pre-war conditions to which you are referring in that connexion?—We cannot have any gold now; if I was to bring sovereigns you would not give me silver, except at the rate of 10 rupees.

5434. That is the effect of the 2s. ratio?—Yes; I hardly care to think about it; it is only on paper; it ought never to have existed.

5435. I have some difficulty in following that, because I understand you to say, almost in the same answer, that the 2s. ratio is negligible and has no effect, and that the 2s. ratio was also, as it were, effecting some substantial change between the pre-war and the post-war system. The 2s. ratio is effective, is it not, in preventing gold from going into circulation?—Yes.

5436. Is that a circumstance in the present currency conditions which seems to you to stand in the most urgent need of rectification?—Yes; a low fixity and an effective gold currency; I think both are necessary; if you give us fixity and even a low fixity, and keep it on the old system of a token currency such as you want, I do not think that it will answer our purpose. Token currency is liable to inflation. Token currency must be a limited quantity, not an unlimited one.

5437. Let me ask you your view upon that. In your opinion the pre-war and the existing system with the rupee as a token coin is a system which is liable to inflation?—Yes.

5438. I gather that in your opinion a system of gold currency would be less liable to inflation?—The figures that I have given there show that your food grain prices were subject to inflation while the Statist says there is a very slight rise.

5439. Could you assist us by pointing out the relevant conditions in a currency system which has gold in circulation which make it less liable to inflation than, shall we say, a gold exchange standard system?—I could not tell that. Naturally I think the gold currency would be an automatic currency; it would not be liable to inflation; there would be no temptation to buy the rupee at 10d. and sell it to the public at 16d. or 18d. You must remember that the Government of India gathered 40 millions in the gold standard by its sweating the people, selling them a 10d. rupee at 16d. That they will not be able to do with a gold currency. There will be no sweating. It is a very refined way of getting money.

5440. What period in the history of currency has that reference to?—After the closing of the mints and the minting of the coins, a ten-penny rupee was sold to the public for 16 pence and you accumulated a reserve of 40 million pounds. I think the country must have lost 400 millions. The 40 millions did not drop from the skies in the lap of the Government of India.

5441. You mean the gold standard reserve?—Yes, the 40 millions of the gold standard reserve. That was from sweating the rupee, buying at 10 pence and selling at 16 pence.

5442. Where did those transactions take place?—I don't know, by minting and giving at 16 pence a coin which cost the Government 10 pence.

5443. The profit on that transaction appeared in the form of the gold standard reserve?—Exactly so, but a profit of 40 million pounds sterling to Government must inflict a loss on the producer—I don't know how many times more.

5444. I should expect, following upon the basis of the opinions which you express, that you would say that the gold standard reserve served no useful purpose?—It has served this useful purpose that you saved 40 millions for Government and must have inflicted a tremendous loss on the producer and the country by selling him a ten-penny rupee for 16 pence. If you had a gold currency, you would not have been able to make that profit.

5445. Obviously if you had not closed the mint to the coinage of rupees, if you had kept the mint open to the free coinage of rupees, the rupee would be always worth no more than its intrinsic value; there would be no profit?—And the same would have been the case if you had a gold currency. You would have no temptation to coin more rupees and swell your treasury.

5446. (*Chairman.*) Obviously if your standard coin and your coin current is a gold coin, then there is no profit upon putting the coin into circulation. Are there any supplementary questions on the subjects which we have been discussing?

5447. (*Sir Alexander Murray.*) Mr. Wadia, the tenor of your statement is that the Indian Government has missed no opportunity to fix the rupee at a high rate, and in proof of that statement in the opening paragraph you refer us to the correspondence which passed in 1879. But as a matter of fact that correspondence deals with a bigger question than that really. It was the question of establishing a gold standard in India which was at stake at the time, was it not?—Yes, but at a higher figure evidently and they wanted it even before the Herschell Committee.

5448. We are now talking, Mr. Wadia, about 1879. Now is it not the case that for about 20 years before that or longer the rupee was at two shillings and Government, in suggesting that the rupee should be restored to the two shilling basis, was merely asking for the continuance of the practice of the preceding twenty years?—Yes, they might do that even to-day.

5449. But you say they have always been wanting to. —Yes, the very letter of the Lords of the Treasury indicates that the object of the Government of India is to fix the rupee at a higher figure and to squeeze the tax-payers.

5450. No, no. The point is this. The rupee for 20 years had been at two shillings; at the time that the correspondence was passing it had dropped to 1s. 9d. and all that the Government was wanting was that the gold standard should be introduced on the basis of two shillings. Therefore, they were not asking a very unreasonable thing in view of the fact that the figure had stood for twenty years at two shillings?—That does not matter.

5451. Then the fact that the rupee has stood at 1s. 4d. does not matter now?—No, that is an artificial rate, but it is a better rate than 1s. 6d. just as 1s. 6d would be better than 1s. 8d. and 1s. 8d. better than two shillings, as far the the country is concerned and as far as the producer is concerned. For well-to-do people like myself, I think the higher the exchange the better it is. I want it at two shillings. If you can call the rupee a pound I would not mind.

5452. But the point I wanted to make was that arising out of your statement.—Yes, but the very fact that even before the Herschell Committee they wanted 1s. 6d.—

5453. But you agree with me that in 1879 it was not unreasonable to ask for two shillings?—I don't think that with reference to currency the Government of India has ever asked anything that has been reasonable.

5454. All right. Let us come down to later times?—This is the result that, after 33 years a great country like this, a great Government like yours,—and I have great admiration for your Government—have not even found a proper rate.

5455. Let us come down to the Herschell Committee in 1893. You say that the Government of India wanted to fix the rupee at 1s. 6d. but that the Herschell Committee refused and made it 1s. 4d.?—Yes.

5456. Now, that is hardly a correct statement of the case, either. What the Government of India wanted to do at that time was to close the mints to the free coinage of silver and to declare the sovereign legal tender at a rate not exceeding 1s. 6d. They didn't say that it should be 1s. 5d. or 1s. 4d. or 1s. 3d. or 1s. 2d. All they said was that the rate should not exceed 1s. 6d. Is that not the case?—No, that is not correct. They wanted 1s. 6d. and if you will read my quotation you will see that they say they will not give 1s. 6d. which the Government of India wants, they think it is better to give 1s. 4d.

5457. May I read one or two quotations? In paragraph 65 of the Herschell Report, it says: "The Government of India, however, add the proposal to make English sovereigns legal tender at a ratio which is not to exceed 1s. 6d." That is what they asked for. And do you know why the Committee did not agree to the 1s. 6d. They wanted stability to start with?—Yes, but here is the quotation from paragraph 135 which I give in my printed memorandum. "The Herschell Committee reluctantly consented." They were not very keen on losing the mints either. They said the Government of India declare bankruptcy, so they——

5458. With all due deference, Mr. Wadia, they did not do that?—If you can give me the Herschell Committee's Report, I will find it out for you.

5459. But the point I want to make is that the Government of India did not ask for 1s. 6d. They only suggested a rate not exceeding 1s. 6d.?—Well, it may be; it is a very immaterial point.

5460. But you said the Herschell Committee had fixed it at 1s. 4d. What they actually said was, let us start on the basis of 1s. 4d.?—Look here, Sir, this is the passage I was trying to get:—They however would not fix the rupee at 1s. 6d. as demanded by the Government of India but fixed it at 1s. 4d. Clause 135 of the report of the Herschell Committee runs as follows: "It is impossible in view of these considerations not to come to the conclusion that to close the mints for the purpose of raising the value of the rupee is open to much more serious objection (the objection is there—I want to stress that point) than to do so for the purpose of preventing a further fall." So the closing of the mint is open to serious objection.

5461. May I read paragraph 151? It shows there what the Committee said, viz.:—"It would not of course be essential to the plan that the ratio should never be fixed above 1s. 4d." That is what the Committee said?—Well I have quoted the clause under inverted commas.

5462. Then Sir David Barbour and also His Excellency, the Viceroy, when the legislation was going through, pointed out that it was only a tentative and provisional measure?—I have read the clause of the Herschell Committee's Report which says that the one was not so serious as the other.

5463. Well, now, coming down to the question of prices, you give in your statement a list of price levels?—Yes, Sir, they are the official figures.

5464. You actually say "the Government of India commenced to coin rupees on and after 1900, and the flooding of the country with token currency had disastrous effects on its economic life." Then you proceed to give prices of food grains since 1894. Is it necessary to go back to 1894? Why not from 1900?—Well I have given it to you from 1904. What I wanted to convey was this that, between 1894 and 1904, there was no difference in the prices of commodities.

5465. Oh yes, there was a very great fluctuation?—Between years, I know that, but they are not being considered. 1900-2 was a famine year and I thought it would be very unfair to give that as a criterion. But I have given it to you from 1904 to 1914 year by year.

5466. We will take 1904. Now, 1894 is the lowest year between 1890 and 1904. Why did you take the very lowest year?—You commenced to coin in 1900. You coined 50 crores of rupees. It had no effect on prices. I took 1904 as the proper year showing a slight rise in 1904 and after that I took it year by year. You were then coining year after year large amounts of rupees. You were selling to the country 10 penny rupees for 16 pence and accumulating what you are now pleased to call the gold standard reserve. It didn't come from the skies.

5467. You give your figures. May I give the actual figures too. I agree that there was practically no coinage of rupees between 1894 and 1900, yet the retail prices of food grains rose steadily from 114 to 120, 155 and 209 in 1897; when there was no coinage going on at all?—You are forgetting very important things when you speak of those years. 1896 was that terrible famine year. 1900 was another terrible famine year. And your legislation and closing of the mints helped

to kill people by millions; for rupees which had cost them a hundred and six for 100 tolas realised only Rs. 60 as bullion.

5468. It was not the expansion of the currency that was responsible then for the increase in prices, because between 1900 and 1904 I think you said there was something like 50 crores of rupees coined. Now, in these four or five years, the prices of food grains fell from 192 to 157 to 141 to 126 and to 117?—Yes, because you had taken the high prices of the famine year. 1900 was a famine year and the effects of famine did not disappear in six months or twelve months. I have been very fair in these figures which I give here, I thought they were very fair to all concerned. I took 1904 and then gave you the figures year by year.

5469. Very well, I have taken 1895?—I have no objection.

5470. The index figure for wholesale prices in India, and general prices at home?—Very well, I have given you Atkinson's figures.

5471. I am taking the other figures?—I may tell you that I attach very great importance to food grain prices. We are not affected by the prices of imported goods; that does not enter into the everyday life of the poorer classes, and that was the reason why I took the food grain prices. But in order not to mislead you I have also given Atkinson's figures which are for imports and exports combined.

5472. You have taken the prices of several food grains and then proceeded to draw conclusions from them. Now the Statist figure, as quoted by you, was in 1905, 72. In 1895 the figure then was 62. The figure for India, general prices, was 104, and the figure for the United States of America for the same year was 94. These are the three figures. Now if we take the index figures in 1913, they were India 143, United Kingdom 85, and the United States of America 132, and if we equate the 1895 figures to a hundred, you find that in 1913 the actual figures worked out to a rise from 100 in the case of India to 137, in the case of the United Kingdom 137, and in the case of the United States of America 140, that is a general rise in prices?—You take exports and imports together. I never attach any importance to import figures. We are affected only by food grain prices in the country.

5473. I am only giving you the figures from 1895 to 1913 to show that general prices rose equally; India, the United Kingdom and the United States of America were all alike in this respect?—I stick to the food grain prices. India is in fact a country where the producers are not the consumers of your commodities, and that was the opinion of two members of the Fowler Committee who said that it is very wrong to suppose that if you make imports cheap the producer is benefited; he does not benefit. The producer is a distinct class, a class apart in India, and to compare English or American figures where you have exports and imports together is misleading as far as this country is concerned.

5474. The consumer in India is a bigger class than the producer?— That may be. But whether bigger or smaller, no country in the world penalizes its producer for the benefit of the consumer. We are the only unique country in the world who are thinking always of the consumer. We should think of the producer first and of the consumer afterwards, but to make it cheap at the expense of the producer is folly No. 1. No country in the world is capable of such a folly.

5475. (*Sir Maneckji Dadabhoy.*) Mr. Wadia, I will put your arguments in a nutshell. I understand you to say that stability is a mere synonym for convenience?—It is a convenience, a great convenience.

5476. You stabilize exchange and you unstabilize internal prices?—The way our currency was worked had that effect. If they had given us gold currency in time and if they had not gone in for a gold exchange standard and the accumulation of 40 million pounds, I think we should not have suffered.

5477. This was the result of a wrong working of the Currency Act?—Yes.

5478. This was a result of a managed currency?—Yes, mismanaged, I call it mismanaged currency.

5479. I am not wrong in inferring from your examination to-day that you are not opposed to stabilization?—Certainly not.

5480. And you recommend the adoption of a ratio of 1s. 4d. immediately?—Yes, because although I would like to do it gradually, you cannot do it because everybody would be sending money abroad and there would be another crisis. It would create a crisis at once, I would not recommend it being done gradually. It should be done at once so that nobody has any chance of sending any money.

5481. Yesterday we had a gentleman here who recommended to us and said, " fix your standard and leave the natural forces to automatically bring down the ratio to 1s. 4d." What is your opinion on that?—Here is the Government of India in possession of the field. They have created a monopoly in the rupee, and when you have a monopoly, you can sell it at any price you like. The Government of India might raise it temporarily if they like to as long as they think that the balance of trade is not affected and as long as the balance of trade in India is in India's favour, whether 25 or 100 crores, you will be able to maintain your high exchange.

5482. Would not this immediate introduction of the lower ratio cause an economic disturbance in the country?—A little. We have seen in recent years exchange at 2s. 11d., we have seen it at 1s. 3d., we have seen it at 1s. 4d., and we are seeing it at 1s. 6d. just now. Of course there is always a disturbance.

5483. You won't mind that?—You have got to do it. They had done it to suit their convenience, why should we not do it for our benefit?

5484. Will you please tell me what effect it would have on existing contracts?—What effect was there on existing contracts when they raised exchange from 1s. 3d. to 1s. 6d. If they benefited in one way, they ought to lose the other way. What effect is it having on the contracts which you have made with your cultivators for 30 years not to disturb their assessments and yet you are making 12½ per cent. more by raising the rate? That is what has become of your contract, not between individuals, but between Government and the ignorant peasant.

5485. You admit that a reversion to 1s. 4d. will cause a deficit in the Government Budget; how do you propose to make up that deficiency, by additional taxation?—I should levy an export duty, because it is 12½ per cent. an export duty at present. That would be simply for the benefit of the Treasury. My own money for instance is raised, with the rise from 1s. 4d. to 1s. 6d., by 12½ per cent, in Europe where I have been spending some money; well I have done nothing to deserve it. I have saved a lot of money like that. The Banks are saving; the Insurance Companies are saving; the steamship Companies are saving through buying their sovereigns at Rs. 13. Well that would be avoided. My contention is that you have got into this mess because you had a managed currency. You inflated prices, the inflation of prices resulted in the inflation of wages, and you had to find more money. If you gave us the natural currency, silver, the inflation would not take place. With 13d. to the rupee, we had a surplus.

5486. By natural silver currency you mean the free coinage of the rupee?—Yes.

5487. Would you now be satisfied with a silver currency provided you have free coinage?—Well, I was satisfied with a silver currency. If you read the Babington-Smith Committee's Report in clause 34 they say that the silver-using countries have prospered as well as the gold-using countries.

5488. (*Sir Henry Strakosch*): Mr. Wadia, I am going to ask you a few questions on a subject which is only indirectly connected with our problem which however seems to me of some importance. You have special experience of industrial development in this part of India, I understand, particularly in the cotton

industry. I wanted to ask you where was the capital for the cotton mills raised, mainly?—In India.

5489. And for the cotton mill industry, the additional capital was also raised in India?—Yes.

5490. And what would you estimate the total amount of money invested in Bombay?—The Bombay figures are 20 crores invested in cotton mills; if you double it, that may be for the whole of India.

5491. How many mills are there round about Bombay?—About 82 to 84.

5492. Will you tell me what occurred soon after the war: were these cotton mills very materially extended in their power of production?—They were not materially extended, but some new mills were projected, and they are now in a very bad way.

5493. And more machinery was added?—Very little. But new mills were projected, and machinery bought at very high prices, and they are being now liquidated. Some of them have gone and some will go.

5494. And of the older established mills, have they increased their capacity?—What has been happening is this. Since you fixed the rate since 1898 at 1s. 4d. we had about 82 mills then. Half the mills were spinning mills; we were spinning for China; they have all disappeared. I think 3 to 5 mills are left. We have all fallen back upon cloth. We found that the fixity of exchange ruined our yarn trade entirely, while the progress which Japan and particularly China have made within recent years has been phenomenal. We have not been able to make that progress at all, and with the exception of the Armistice period of two or three years, our spinning and weaving trade has not been doing well.

5495. Is it correct to say that the cotton mills have been particularly prosperous in the years 1919, 1920, 1921?—Very prosperous.

5496. And they have paid their profits fairly up to the hilt in dividends?—I do not think so. There is no truth in that statement. I think half the profits were divided and half the profits were kept as reserves. The old mills, though not now making very much owing to the bad condition of trade, are financially in a sound position, but the new ones will have to be liquidated.

5497. You say half the profits were divided and the other half were kept in reserve, against depreciation and other accounts? Well then it seems these profits must have been gigantic, some dividend declarations going up to 400 per cent.?—They were gigantic. But this is no use comparing those exceptional, abnormal, times. We are not going to have another big war again in our life time. These are all abnormal results.

5498. Now the cotton industry is doing badly?—Yes; not particularly now, but after this heavy fall in cotton.

5499. But it has been doing very badly?—Yes; I find that they lost for the year 1924. All the Bombay mills have lost money. There is not one mill which has not lost. The industry taken together has lost money.

5500. To what do you ascribe that?—High exchange is one of the causes. High cotton is another. Then high wages. I see that our wages have gone up something like 125 to 150 per cent. and when there was a talk of reducing to 15 they would not consent to it.

5501. Is it correct to say, another witness gave us figures, that the present index figure for wages in the mills is 231, 100 being the pre-war figure?—I believe so; it would be correct.

5502. The general prices are about 160; are they not?—Yes. The general price is 60 or 65 per cent. more. I would not say that the workman is being overpaid or paid fully; because we have not paid for the inflation which has taken place in 1904. . In 1904 the retail food grain prices were 117 and in 1914 they were 222. He did not get much for that.

5503. But surely general prices, or let us say cost of living figures, are the fairer index to take than the food grain prices alone?—Yes; that is the most important item in the poor man's budget.

5504. But the cost of living figures very ably compiled in Bombay should give a good picture of the situation?—Yes; but they do not give you anything before 1914 and I say that there has been rise in food grain prices long before 1914. They were only comparing with the year 1914; but what about food grain prices which rose from 1904 to 1914? I know this Labour Bureau Report.

5505. I see here, for instance, that the cost of living figures converted into gold at the present time in Bombay in rupees is 152, whereas wages are standing at 231. Does not that suggest that wages have risen out of all reason in relation to the cost of living? —Yes, if you compare with the 1914 figure. There has been a rise of 90 per cent. in food grain prices. The correct thing would be for the Labour Bureau to givo you figures from 1904. But what had they given? You have got to add 90 per cent. in food grain prices which has taken place between 1904 and 1914.

5506. You therefore think that wages have very little influence?—Yes; the poor people if you cut their wages and if they could afford to get on, they won't strike; I am not inclined to blame them very much.

5507. If you were to fix your exchange, the purchasing power of your rupee, at 1s. 4d., would that not really have the effect of reducing the wage of the wage earner by 12½ per cent.?—No; if you have your rupee to 1s. and if you go on filling the country with token currency, your food grain prices will rise all the same. Look at the French exchange. It was 25 francs to a pound and it is 131 now.

5508. But that is hardly parallel?—No; but what I say is this; that inflation would never stop unless you have a sound currency.

5509. Let us stick to the point. I wanted to know whether it is not a fact that if the exchange value of the rupee were fixed at 1s. 4d. as compared with the present exchange value of 1s. 6d., there would be a curtailment, with the same level of wages, of the real wage of the wage earner by 12½ per cent.?—You had your exchange at 1s. 4d. between the year 1892 and 1916 and yet your food grains rose by 100 per cent.

5510. But that is not the point if I may say so. To-day commodity prices have adjusted themselves, let us say, to the present 1s. 6d. rate?—There is another thing, let me tell you, as regards commodity prices. Is it export commodity prices or commodity prices of food grains like javari, bajri, etc., which are not exported?

5511. I have taken the cost of living figures which are more appropriate for that particular purpose?—Our exchange will not affect our internal prices of commodities which are not affected by export. There are certain kinds of food grains in India which are produced and consumed in the country itself and not exported. It may affect wheat and other things but it would not affect bajri or javari, large quantities of which are produced and consumed in this country alone.

5512. Do you suggest that the prices of food grains in India are entirely independent of the movement of prices abroad?—Not all food grains prices; for instance, wheat is affected; but bajri, javari would not be affected. They are not exported. To compare India with all the other countries one must be extremely careful This is a country distinct and apart.

5513. But the ordinary laws governing prices apply equally to India; do they not?—No; I would not apply them blindly. It would be a mistake to do so.

5514. But is it not a fact that India imports just about as much as she exports?—No; in the first place that is not correct; but even if she did, the exporters are a different class of people and the importers are a different class and that is not my own opinion but that of two members of the Fowler Committee who signed a minute of dissent and they were quite emphatic on that point. I have got that minute in my pocket but I won't trouble you with reading it.

5515. I think that exhausts my questions on that particular point. I want to refer to a remark which you made, in which you suggested that the Government had been sweating the people by taking away from them the difference between the silver value of the rupee and its exchange value. I do not quite appreciate what the complaint is. Because the difference has been stored up in a reserve which is used for maintaining the exchange value of the rupee. I should like to know what the complaint really is?—The complaint is that when you make one rupee in your reserve, you will lose perhaps 6, 8 or 10. Suppose now you have got Home charges worth 30 million. With 1s. 6d. rate you are saving 12½ per cent. But the 200 millions of exports are affected by that. So when the country loses on 200 millions of exports, you as Government gain on 20 or 30 millions on account of Home charges. That is the complaint.

5516. You, therefore, think that the export trade, by raising the value of the rupee, is suffering?—It is suffering in two ways. You first make it suffer by making the exporter receive only Rs. 13 for his sovereign worth of produce instead of 15 and the other way is that you sell him rupee which costs you 10d. at 16d. and in order to gain one rupee for your Treasury he has got to suffer a loss on the 200 millions which he exports. Not only that, but the articles which he is selling here locally; for instance, you have a crop of 50 lakh bales of cotton half of which is exported; I as a consumer am buying cotton at the same level as export prices. There is no difference in the price of a bale of cotton bought in Liverpool or in Bombay.

5517. Do you suggest that the world price of cotton is influenced in any way if the rupee is worth 1s. 6d. instead of 1s. 4d.?—Yes.

5518. Does not that 1s. 6d. rupee buy proportionately more abroad?—Of course it does.

5519. Or internally?—I do not know about internally. If he were buying a bottle of whisky, of course, it is all right. If the ryot, after selling his quantity of cotton, bought a bottle of champagne or whisky, he would benefit.

5520. We are talking of cotton, not of champagne?—It is the same thing. I want to make the example a little more telling.

5521. Let us stick to cotton. Do you suggest that the price that cotton will fetch in India will be the same whether the external purchasing power of the rupee is 1s. 6d. or 1s. 4d.?—Yes. I will buy more cotton. As a buyer I will benefit; but as a seller I lose.

5522. But then you do not admit that the price adjusts itself?—How? It will adjust itself to your exchange. The price of cotton is not fixed by anything we can do here. It is fixed by America which produces the largest crop in the world. If American prices rise ours will rise. If they fall ours will fall. But if you have the exchange at 2s. to-morrow, of course the cotton will drop gradually. The foreign buyer will not pay you a penny more or less for your commodity except what it can fetch in the neutral markets of the world.

5523. I appreciate that and for that reason I ask you why does the exporter suffer?—Not the exporter; it is a mistake if I said so; it is the producer.

5524. Why does the producer suffer?—Because he is made to receivo Rs. 13 instead of Rs. 15.

5525. But if these Rs. 13 buy as much or as many goods as the Rs. 15, where does he suffer?—If he is buying a bottle of champagne, it is all right. Let me read the opinion of the two English gentlemen, as regards that opinion which you hold.

5526. I am not holding the opinion. I am asking you questions. You said that the people have been sweated by the Government because the reserve has been accumulated. It is true, is it not, that the reserve is still there? It has not been eaten?—No. 40 millions are there. Perhaps the country may have lost 200 millions or 400 millions. As a matter of calculation we must take the exports of all these years and debit with 12½ per cent. and credit with 40 millions.

5527. Well, now look here. You know probably that a great many countries are adopting or have adopted what is commonly called a gold exchange standard?—Yes, but are they sweated?——

5528. I beg your pardon, let me finish—where the chief medium of payment internally is the note. Would you say because the note costs less to print than the rupee coin, that the people have been sweated to a more cruel extent than the people of India?—No. Other countries are not sweating their sovereign or gold.

5529. But if they issue notes and accumulate reserves for the proceeds? Taking your own analogy they have been sweated increasingly to the tune of the difference between the price of the silver which is contained in the rupee and the bit of paper which constitutes the bank note?—The paper is all right. There is metallic reserve behind its back. You can have the gold metallic reserve. Instead we have the silver notes. That is the difference. Your rupee is a silver note; so you have got against your currency notes, silver notes. You have not got *pucca* reserve, because you want to sweat the rupee. I never heard of any civilised and highly organised country doing what you have been doing in India for the last 30 years.

5530. Well, then, I submit that destroys your argument. But I wanted to point out to you that it is exactly the same thing that has been happening all over the world. In the best regulated countries notes were circulated which cost very little to print and reserves were placed against them. In India you have had notes with reserves placed against them, and you have silver coins?—These are silver notes; they are notes, one note against another.

5531. Therefore you absolutely disagree with Ricardo as regards the desirability of having a currency which is internally inconvertible and externally freely convertible into gold. He describes it as the ideal currency and a currency of the greatest economy?—Yes, I think a note is a very ideal form of currency but keep a stock of gold against it; you are keeping a stock of silver notes.

5532. Therefore you would be content if the silver notes, rupees, were taken out of circulation and notes printed on paper put in their place, provided that proper reserves are established against them?—Yes, in gold.

5533. What percentage do you think you will require in your reserves?—I have already told you that for a certain number of coins and currency notes Lord Rothschild estimaed £20 millions. I think on the present basis we should have 60 to 70 millions.

5534. What percentage of gold would you require?—50 per cent.

5535. Therefore I may take it that you would be content with a note currency in this country which is backed up to 50 per cent. by gold?—Yes.

5536. And silver as token currency? And silver completely as token currency. In other words you would be content with a gold exchange standard on those lines?—A gold exchange standard with a gold currency; not merely the gold exchange standard as it has been advised.

5537. You insist, in addition to the notes, upon gold coin being in circulation?—Not necessarily in circulation. I would not encourage the circulation of gold; in 1911 I was in France and when I paid fifty pounds in British gold they would not give me the equivalent in French gold; in fact they gave me a lot of trouble.

5538. You would not be content to have notes circulating as the only medium?—But there is this difference between our country and France. Our people are used to metallic currency. If they want silver it ought to be given; but of late everybody is using gold and has got a liking for gold.

5539. But you would not necessarily give gold in place of silver?—I would not encourage it.

5540. You would have the silver coin as token currency provided a proper gold exchange standard is established in this country, and proper provision is made for automatic contraction and expansion. Would you say that the time would then be ripe to reduce the silver rupee to the status of a token coin of limited tender?—As soon as possible.

5541. You do not think that the people would become uneasy or distrustful when you did this?—They are distrustful now of your policy.

5542. Excuse me, it is not our policy; we are not the Government?—When I say you I mean Government.

5543. I am seeking enlightenment as to what is to happen in future. You think it is possible on the introduction of the orthodox gold exchange standard to reduce the silver rupee to a token coin?—That is it.

5544. (*Sir Reginald Mant.*) I think that you are the only witness so far who has suggested the reopening of the Mints for free coinage of silver?—Yes.

5545. Do you think there is a considerable volume of opinion in India in favour of that policy?—No, there is not. They now think that having gone through all the trials and troubles that the sooner you give us the 1s. 4d. rupee with a gold currency the better. That is the general opinion. I myself would prefer it too but if you cannot do that, I should go to silver right off. If you say, we cannot give it to you for reasons which arise out of this country or out of London or England or any other country, then I should go to silver straight away.

5546. Then really the reopening of the Mints is not a question of practical politics?—No, not at present unless you show your helplessness.

5547. (*Sir Purshotamdas Thakurdas.*) Mr. Wadia, you have been taking an interest in these questions regarding currency and the financial policy of the Government of India for at least 40 years?—No, 30 years.

5548. You have been connected with the Bombay mill industry for more than 30 years?—35 years.

5549. Your connection has been in the shape of a substantial hand in starting some mills and in looking after the management of these?—Yes.

5550. I think I am right when I say that for the last 22 years you annually review the Bombay cotton mill industry and its working?—For the last 20 years.

5551. And you have also evinced a very lively interest in the currency policy of the Government of India by continuous contributions to the local press?—Yes, I have.

5552. I would then like your assistance in connection with the effect of the higher ratio of 1s. 6d. on the cotton mill industry as far as the adverse effect of it is concerned?—If imports are cheapened it must affect the industry.

5553. It enables you less to compete. It has been pointed out, and that is where I particularly seek your assistance, that owing to the rise in exchange by 2 pence cotton, raw cotton, which is an important raw material of the industry, required by the industry, is available to you 12½ per cent. lower?—I do not know whether it is so or not. Theoretically it is so.

5554. But you yourself admitted that to Sir Henry Strakosch?—Let me tell you one thing. Exchange is not the only factor which regulates the price of a commodity. Suppose your exchange is low and there is yet a big American crop, your producers will not sell cotton at a high rate, however low the exchange may be. It is only one of the factors.

5555. Taking everything to be normal, in perfectly normal circumstances, with a higher rate of exchange, cotton is lower to the extent of 12½ per cent. with a two pence rise in exchange?—Yes.

5556. Is it correct that 60 per cent. of your cost of production is the cost of cotton?—Yes it is so, in rupees.

5557. Then on 60 per cent. of your cost of production you save 12½ per cent. taking everything else to be normal. It is also contended that 7 per cent. of your cost of production represents the cost of imported stores and machinery parts from abroad?—It may be that.

5558. I give you these figures as given to us by Sir Victor Sassoon who appeared on behalf of the Bombay Millowners' Association. They cannot be very far wrong therefore?—Yes.

5559. You have 12½ per cent. on that 67 per cent., on which you make that saving. Could you by your wide and expert knowledge regarding the cotton mill industry tell us whether you save anything on the 33 per cent. or whether you are adversely affected on the other 33 per cent. by the higher exchange?—I do not think you would save anything on the 33 per cent. What I want to tell you is this. It is often lost sight of that assuming you save on your cotton, assuming you save on your stock, still it is a loss to the manufacturer to have a high exchange and for this reason that when the producer is not getting enough money for his produce, if you benefit to this extent, and I grant that you do benefit, if your producer receives fewer number of rupees, this producer's purchasing capacity for your goods is to that extent less and you have therefore very little benefit.

5560. I therefore want to know if you confirm this that although a higher exchange does benefit the Millowners to the extent of saving 12½ per cent. on 67 per cent. in the cost of production, the Millowner has found, and we cannot have a better representative of the Millowners than you with your 35 years' experience, that a higher exchange in the long run is against the cotton industry and is harmful to it?—It is against the country, not only against the cotton industry.

5561. Will you kindly restrict yourself to my question? It is harmful to the local cotton industry?—Yes, it is.

5562. Now it has been said that the cotton mills paid very high dividends during the boom period?—They did.

5563. You have had 35 years' experience and I take it you have been connected with one mill or another during all these years. Could you tell us, without specifying the mill, what the average return on the last 35 years' investment has been, 6, 5, 7 or 10 per cent.?—It has been very poor; between 1890 and 1900 the late Mr. J. N. Tata had all the mills of the Presidency examined and Mr. B. J. Padshah brought out a pamphlet, a copy of which exists with me and perhaps with the Tata's too, in which it is shown, going over a number of years, 10 years, they found the profits of the mills were about 4 per cent.

5564. That is what I also heard. Could you tell us what your personal experience as an investor has been, taking into account the boom period of extraordinary dividends to which Sir Henry Strakosch referred? What is the average return from 1890 to 1925?—Well, the average would be very low, barely 10 per cent. if you take the boom period.

5565. Including the boom period?—Yes.

5566. So that if the boom period had not come by the coincidence which it did——?—The industry had for generations been a struggling industry.

5567. Now regarding the adjustment that is generally being talked of after the change of ratio from 1s. 4d. to 1s. 6d., do you think, Mr. Wadia, that that adjustment is complete?—Well, of course, I am buying things cheaper if I go to European shops; I must buy cheaper; but what I say is this, that our imports are more or less for the well-to-do classes; they do not affect the poorer classes.

5568. Excuse me; there are two of my colleagues still waiting to ask you questions, and I should like you to answer my questions and nothing more: do you think that the adjustment has been complete as regards the cotton industry?—You know that cotton is affected and your stores are affected, and as to machinery you require machinery once in 20 years.

5569. What about wages, have you had any drop there?—They wanted to reduce them by 15 per cent. but they wouldn't have it.

5570. Now if the 1s. 6d. rate continues, would the industry have to enforce a reduction in wages in order to complete the adjustment?—I do not think you will ever be able to enforce adjustment, because your food grain prices have been high since 1904 and you will have to struggle on with them. I do not see very prosperous times for the industry.

5571. Therefore as the adjustment of wages in the industry is not possible, it will continue as a very bad maladjustment.—I think the situation is practically hopeless.

5572. Mr. Wadia, I was thinking of hereafter. If this state of things continues, you feel that there is no likelihood of an improvement?—Not within a reasonable time.

5573. And the industry will have to struggle on owing to continued maladjustment in wages as far as the 2d. rise is concerned?—Yes.

5574. Then would you kindly refer to the last paragraph of your memorandum? I think you have a printed copy. Then, I would very much like to explain what exactly you mean in the next sentence where you say: "I do not see any use of examining this question again, except to squeeze the tax-payer by a high fixity for the benefit of the foreigner." By the word "foreigner" do you mean the man who exports to India?—I do not mean him alone, but anybody who comes out to this country to make money, whether it is the Government servant or whether it is the banker or broker or ship-owner or engaged in any calling; I mean all those who come out to this country for making money and remitting their profits out of India, people whose faces are set westwards; they are only here for a time.

5575. Did you not at one time (if I mistake not last March) give us some figures of what you thought were remitted out of India by the foreigner trading in this country?—Yes; by these jute mills, tea companies and all that; I believe 50 crores was the sum I mentioned.

5576. You say "It is said that the present high exchange of 1s. 6d. is the result of trade."—I do not say that.

5577. You say that in your written statement?—What I said was that it has been given out that this 1s. 6d. is a natural rate and that because our export trade is booming, therefore it has gone up to Is. 6d. All that I say is: "No, 1s. 6d. is as unnatural a rate as 1s. 4d." I say that the Government is maintaining it at 1s. 6d. because it allows the exchange to go up to 1s. 6d. and then begins to sell rupees, begins to give rupees if you want it.

5578. When you say "the result of trade," what you mean is it is said that the present high exchange of Is. 6d. is the natural result of trade?—It is said so: I do not say so.

5579. Of course you follow it up by saying that it is absurd to think so. I just wanted to ascertain what is meant by the words "the result of trade"; that is all.—They say that exchange is going up, because the export trade is booming and therefore Government and bankers could not help themselves. All that I say is this; that if a banker could bring silver if it was an open mint and get rupees from the mint, there would be no occasion for him to give Government a higher rate. But he is obliged to give a higher rate because he is in want of funds and he must go to Government, the only seller of rupees. Government says: "We will give you at Is. 6d.", and he is bound to buy it.

5580. In fact, you maintain that 1s. 6d. has been made feasible and an actuality by manipulation and not by any natural forces?—Of course; but so is Is. 4d.; with silver at 32d. the natural rate would be 13d. 1s. 4d. is unnatural; 1s .6d. is still more so. What is the banker but a financial bookie who buys and sells at a certain figure? He was buying and selling at 2s. 11d.; he is now buying at 1s. 6d. and selling at 1s. $6\frac{3}{16}$d. He is nothing more.

5581. (*Chairman*.) The Commission is much obliged to you for your very full assistance this afternoon.

(*The witness withdrew*.)

SIXTEENTH DAY.

Tuesday, December 15th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADHABHOY, K.C.I.E.
Sir HENRY STRAKOSCH, K.B.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER (Joint Secretary).

Mr. GORDHANDAS PATEL, called and examined.

5582. (*Chairman*.) Mr. Patel, you are a Bachelor of Arts and the Joint Honorary Secretary of the Ahmedabad Millowners' Association?—Yes.

5583. Your Association has been good enough to supply the Commission with a full memorandum* in which its views are set out, and you are so good as to come here to-day in order to assist us with any questions which may arise upon the memorandum?—Yes.

5584. We understand that you give evidence on behalf of your Association and not personally?—Yes.

5585. I will, if I may, ask you a few questions to ascertain the views of your Association upon those aspects of the memorandum which appear to me to need elucidation. In the first place you are (I say "you" for convenience) of opinion that the time has

* Appendix No. 28.

come to take measures for the stabilisation of the currency?—Yes.

5586. And you arrive at the conclusion that the best way to achieve internal price stability is to secure stability in terms of gold?—Yes.

5587. The arguments in the memorandum appear to point to the conclusion that, if the rate were now standing round about 1s. 4d., it certainly ought not to be raised to 1s. 6d. I do not quite follow at first sight how your arguments lead to the conclusion that, it being now, as we know, round about 1s. 6d., it should be lowered to 1s. 4d. What are the considerations that lead you to that conclusion?—The introduction of the gold standard in this country has not been made and it is due to that that the exchange remains higher.

5588. But the exchange was at 1s. 4d. before the War without a gold standard, was it not?—Yes, but at that time we were nearer to the gold standard exchange system than we are to-day.

5589. I understand it was because the entry of gold into circulation was prevented by the artificial two-shilling ratio. Is that what is in your mind?—That was after 1919.

5590. Yes?—But I am talking of 1917.

5591. Supposing that the Government of India were to come to the conclusion that the rate should be 1s. 4d. and not 1s. 6d., what measures would, in your opinion, be necessary in order to attain that rate?—First they should introduce the gold standard and secondly a gold currency in this country, as in England, and then the exchange would be stabilised automatically by the inflow and outflow of exports and imports in this country.

5592. To avoid all possibility of misconception, you refer to a gold currency as in England?—Yes.

5593. But, in fact, has England got a gold currency now?—No. Gradually, as more confidence has been developed, the gold notes and other currency are being circulated while the gold has to be stored up there. That is at the end of a long career and long confidence in the minds of the people. In the initial stages in India we want a gold currency and a gold standard, and after the stabilisation of this system for about ten or fifteen years, we will be practically just in the same position as England is to-day.

5594. Would you assist us to understand how the introduction of the currency system which you recommend would result in a reduction of the rate to 1s. 6d. without further measures?—Exchange is rather fixed by exports and imports between the different countries. So, in that case, when India requires more money from outside countries it would get more gold. Or, if there is gold currency here, in that case gold will be in greater circulation and the exchange will be stabilised at 1s. 4d.

5595. I do not quite follow at the moment why the entry of gold into circulation would achieve that result. As far as we know at present, if gold went into circulation it would be in substitution for something else, other things being equal, would it not? —Yes.

5596. And it would result in no increase in the currency medium. Why then should it have an effect upon the rate of exchange?—Because other countries in that case, if they have to send money to India may send actually gold, which is not practicable at present. Or India may send gold to them, gold being available in larger quantities than the requirements of this country.

5597. At any rate, I understand your Association would recommend no more active steps to reduce the rate to 1s. 4d. than those changes in the currency system as regards the position of gold which they recommend?—There are other active steps, as, for example, the judicious selling of council bills.

5598. The judicious selling of council bills in London?—Yes.

5599. Against rupees in India?—Yes.

5600. What do you mean by "judicious" in that connection?—Council bills ought to be sold to that extent to which they are actually required under the budgeted estimates. Any further advance beyond that limit would rather act contrary to the interests of the country as well as create great fluctuations in the rate of exchange.

5601. When you mention that in this connection do you mean that the sale of council bills is to be made for the purpose of reducing the rate of exchange?—Want of judicious sale in regard to council bills affects the exchange; that is what I mean to say.

5602. You would use the sale of council bills in order to promote the reduction of the exchange?—Yes.

5603. That would be reducing the exchange by increasing the internal currency in India, would it not, otherwise it would have no effect on the exchange?—Not increasing the internal currency in the form of token coins, but in the form of gold standard coins.

5604. What do you contemplate then should be the operation, that council bills should be sold in India, with what, with notes?—With gold notes or gold coins.

5605. Whatever the form, if it is to have any effect in reducing the rate of exchange, it must be by increasing the proportion of the currency?—Yes.

5606. That being so, that will have an effect on prices in India, will it not?—Yes.

5607. What will be the result on Indian prices?—Prices will be stabilised and they will be lowered to a certain extent.

5608. Does it tend to stabilise prices if you increase the proportion of the currency in the country, or does it not rather tend to a rise in prices?—If you increase the currency with a gold standard and gold coins, then it will bring the prices to stabilisation point.

5609. If it has no effect on prices, how can it affect exchange?—It will have an effect on prices.

5610. What would that effect be? Would it raise prices?—I think it will be to lower prices gradually.

5611. By increasing the relative amount of currency you would lower prices. That does not seem a probable result?—When there is a greater circulation of gold currency here; naturally, prices would not increase; on the contrary, they might be lowered; there might be fluctuations for a certain period, but after that they would be automatically adjusted with very little fluctuations.

5612. Would you or would you not accept the general view that when you increase the amount of currency in a country in proportion to the things which are bought with currency for goods and services, that might tend to raise prices, and *vice versâ* when you decrease the amount of currency in that proportion that might tend to lower prices?—Provided there is no sufficient backing. If there is sufficient backing, probably prices will be reduced gradually.

5613. I do not think that the question of backing is relevant in the proposition that I have put. I was looking at the total quantity of currency in the country. Backing may tend to be a consideration where the point is how to increase or decrease it; I do not see that it is quite relevant to the matter to which I wish to direct your attention. At any rate, I gather it is your opinion that, by the sale of council bills resulting in an increase of the currency such as would reduce the rate of exchange, there would be no consequent effect on Indian prices except that of stabilisation. Have I correctly given the purport of your suggestion?—I do not mean by increasing the currency the coining of rupees. If you stop coining rupees on the one hand and if at the same time you introduce a gold currency, in that case there will be stabilisation of prices, after some fluctuations.

5614. My question certainly did not refer to one form of currency rather than another. I understand that, in your opinion, the result of such a process as the sale of council bills to promote a fall in the rupee, given the adoption of your proposals as regards the promotion of a gold currency, would be no other than that of stabilisation of Indian prices?—Yes.

5615. The opinion which you have now expressed greatly simplifies the analysis of any possible effects of an alteration in the rate of exchange. Nevertheless, let me ask you one or two further questions. Under question III, your Association makes a reference to the sale of council bills so that the tightness of the money market may be removed by the consequent increase in the currency. There is just one further question as to your previous reply upon this topic that I should like to ask. Is it your opinion that your expectation as to the result of such an increase in the currency on Indian prices is confirmed by the experience of other countries in periods during which the currency has been increased?—So far as I remember, in America there were similar conditions. I do not remember the exact time.

5616. I was wondering what period of increase in the currency in America you had in mind?—I cannot say exactly. I have no other analogy in my mind with regard to other countries.

5617. You could not give us any instance of a country having any system of currency, whatever it might be, a gold standard or a gold exchange standard, in which there has been such an increase in currency as that referred to here, which has been achieved without any consequential effect upon internal prices. Has it not been the common experience that such an increase of the currency is followed by a commensurate rise in internal prices?—Yes, the first effect would be that, but the after-effect will be the stabilisation of prices. Any measure when it comes first has certain effects which have for the time being to be suffered, but afterwards, when the conditions become normal, gradually the whole position adjusts itself.

5618. I think that really brings us more together, if we understand that such an increase in the currency is at any rate followed by an initial rise of prices in the country. Now I want to put this point to you which may have been considered by your Association. When there is such an increase and a rise in prices, which you tell us is only temporary, that effects, does it not, a disturbance as between the debtors and creditors of a country?—Yes, there would be, as the first effect of it.

5619. And that disturbance, when there is a rise in prices, is to the detriment of the creditors, is it not? —Yes.

5620. And particularly that class of creditors who are creditors in respect of interest on fixed capital? —Yes.

5621. So that the effect of such a rise would be that all investors in fixed investments would be worse off proportionately?—For a temporary period only, and perhaps they may gain to a better extent at a later stage, but they will be temporarily worse off.

5622. All those who are debtors in respect of long term investments would be better off?—Yes.

5623. Now I want to look at it from another aspect. I understand you actually express the view in your Association's memorandum that one of the great interests which you desire to serve by the introduction of a reformed gold currency is to encourage the saving and investment habits of the people?—Yes.

5624. From this point of view, is it really a way of encouraging the saving and investment habits to start off with a measure which so definitely is adverse to the interests of the saver and the investor?—Every measure whenever it is newly introduced does have some hard effects on some sections of a community. If we take the example of a sudden rise and fall in exchange, we feel that the position of creditors and debtors is suddenly changed from one extreme to another within a period of three or four months. So these things are not to be calculated when we introduce new reforms, because we have to consider that the final effects will be stabilisation between the parties, and in my experience such hard cases could not be considered in framing a law.

5625. There are one or two points concerning your practical recommendations on which I would like to elucidate the opinion of your Association. In the first place, who would have the management of the note issue? Would it be given to the Imperial Bank? Are they to have full control of policy and of the reserves, or something short of full control?—I think they should be given full control; but at the same time there should be an Advisory Board of non-official members, and the Bank should be prevented from doing exchange business, or there must be a separate department altogether for this purpose.

5626. Then you recommend, as to the constitution of the Bank that it should be supplemented by an Advisory Board and other necessary safeguards. Let us take them one by one. What do you suggest should be the composition of the Advisory Board? Is it to consist of officials, or bankers, or merchants, or of what class?—Advisory Board of some experts of this country in currency and exchange matters.

5627. Currency experts?—Currency experts and some Government experts also.

5628. By experts do you mean gentlemen in the academic world or gentlemen in the business world? —Both.

5629. And Government members too?—Government members also.

5630. What will be the functions of the board?—The board should be an advisory board, and there should be statutory powers defined actually for the purpose of the board as well as for the working of that department.

5631. The board will, I understand, tender advice to the governing body of the bank?—Yes, and there should be statutory laws previously fixed before the establishment of the board as well as the separate department, and the department should be run on the lines fixed by those statutory rules and regulations.

5632. You say there should be other safeguards. What is the object of the safeguards?—There will not be injudicious use of these powers, or in times of emergency they may be well advised.

5633. I am not adopting any opinion; I am only testing your views. Why should the advisory board consist of gentlemen in the academic world and the business world? Do they understand the business better than the men engaged in the industry itself? —Because all these brains combined are in the nature of a complete expert body. Academical men would be looking at the question from the standard of theory. Practical business men would be looking at the question from the point of view of the difficulty which the business men will feel, and the Government members will look at the question in the light of the difficulties in which the Government will be involved in undertaking a particular policy. So all these different interests and all these different kinds of practical brains should be put together to form out a regular scheme or to give regular advice in a particular action.

5634. Might it not be said that banking is a very technical business, that the best man to understand it is a banker, and that you cannot make one banker by putting together a professor, a merchant and a Government official?—Well, I think all of them will agree on a particular method or they may go by a majority if necessary.

5635. You might get a majority decision by the professor and the Government official against the business man or by some other combination. Would that be a practical way of conducting a very technical business?—Of course we get some members from the non-official side of the Legislative Assembly.

5636. On the advisory board?—On the advisory board.

5637. Are there any other safeguards which you would desire to see incorporated in the constitution of the Imperial Bank before the transfer?—That is a matter for experts to determine. They should go into the whole constitution, into the whole working,

and they should consider the line of future undertakings; and the experts should finally determine what kinds of safeguards are required for this purpose.

5638. The safeguards being directed to the end of the proper conduct of the business of the bank?—Yes.

5639. You recommend that the lowest denomination in notes should be Rs. 5 as at present?—Yes.

5640. Did your Association consider the desirability or otherwise of issuing one rupee notes?—At present they do not think there is any necessity of having one rupee notes; because they are likely to be lost and also they are likely to be spoiled. They are used greatly by masses, agriculturists, and such other people.

5641. What is your experience as regards their popularity during the period of their issue? Were they readily accepted, and circulated?—Yes; they were accepted; but the paper was of such a quality that it was much spoiled. The masses are not expected to handle these notes very carefully. Sometimes the oil monger may spoil it in oil and some other man in something else, and the texture of the paper was not good.

5642. That brings me on to that part of your Association's memorandum where they set out in more detail the recommendations as to the nature of the gold currency which you contemplate. Could you explain to us the paragraph under question VI in which you say, "It will be difficult in a country like ours to have a gold standard without gold currency. The use of gold coins will therefore be a necessary stage before we can adopt a more economical form of gold standard like that of England." If I followed your previous answers, they are to the effect that a gold currency is needed in order to inspire confidence in the public in the measure of value?—Yes.

5643. In order that it may have that effect, it is necessary that a certain amount of gold should go into circulation, is it not?—Yes.

5644. How do you contemplate that gold will actually get into circulation?—In the form of gold mohurs.

5645. What would be the process of issuing these mohurs?—They should be minted here in India.

5646. When they are ready, minted in the mint, how are they going to be put into circulation? I just want to follow the process of the introduction of the gold currency?—They may be given to the public whenever they require them as it is being done by the Bank of England.

5647. Issued against council drafts? That is one way in which you recommend the sale of council drafts?—Yes.

5648. Do you propose they should be issued in exchange for rupees or notes?—Yes.

5649. Both?—First for notes and then for rupees as it is convenient to the Government according to the measures that it undertakes.

5650. Initially, at any rate, their issue is to be only optional?—Yes.

5651. You look forward to a period during which the Government should undertake the obligation to give gold against notes and rupees?—Yes; at the end of 10 or 15 years the position will be complete.

5652. Can you tell us what your view would be upon the contention advanced by various witnesses that, due to the habit of gold hoarding in India, if gold is put into circulation in that way it will all drain off into hoards? Do you look upon that as a probable result?—I think it may be a temporary result. But as soon as more confidence is established in the people, they will on the contrary bring forward their hoarded gold and send it in circulation.

5653. There will be an initial period during which the gold might be hoarded?—There may or may not be. We cannot say that with any certainty. Perhaps there may be sufficient hoarding of gold with them at present, which may not compel them to obtain more gold or there may be temporary feeling in the public mind and they may go for more gold.

5654. One has to contemplate the possibility, shall we say?—Yes.

5655. Then we come on to the period at which you give gold as an obligation against notes and rupees. Do you propose to limit the legal tender of the rupee?—I think it may be fixed at Rs. 100.

5656. What, from your knowledge of the conditions, would be the effect of that upon holders of silver hoards?—I think silver will be released.

5657. And gold taken?—And gold may be taken, yes.

5658. There, again, your view is that we must contemplate that as a possibility?—Yes.

5659. Having considered these three requirements of gold, the amount of gold that will be required for circulation, the amount of gold which may be drained off into fresh hoards, and the amount of gold which may be required in substitution for silver hoards, has your Association been able to form any estimate of the additional amount of gold which will be required in order to bring this policy into operation?—It may require ¼ of the present currency to the highest limit, say to the extent of 100 crores of rupees.

5660. You contemplate that it might require as much as 100 crores of rupees of gold?—Yes; but not at one and the same period, and in that case the holding of silver will not be a necessity with the Government. They may at that time judiciously sell silver in different lots or at different intervals and utilise that money in bringing gold.

5661. That is relevant when we consider the cost of obtaining the gold, but the point I am now directing your attention to is the actual additional supply of gold which will be required. You put the estimate at about 100 crores of rupees?—Yes.

5662. It might be mentioned in passing that we have had other rather larger estimates. Accepting for the purposes of our discussion your estimate of 100 crores. . . .?—In the initial stages, I mean, subject to regular replenishment from different sources at the same time.

5663. Has your Association considered how that gold can be obtained?—India is always a creditor country, and it can expect more gold to come from foreign countries. That is one source.

5664. You say India is a creditor country in the sense that it takes the balance of its trade in bullion?—Yes.

5665. That bullion is already being used up for various purposes, namely, ornaments and so forth. It has been absorbed in past years; it has not gone into circulation, so that what you are contemplating here is, is it not, an addition to India's normal imports of gold?—Yes.

5666. The question that occurs to me is how is it possible for the Government of India, which has to supply the additional gold, to obtain it. It may be suggested that the only way in which the Government of India can obtain this additional supply is by raising foreign credits and in substance borrowing the gold?—Yes.

5667. In order to fill the currency?—Yes.

5668. That appears to be a necessary conclusion, does it not?—Yes. Instead of selling council bills they may have forward borrowing in London.

5669. You have, perhaps, seen an analysis in regard to this matter in our memorandum containing certain suggestions which has been supplied to the witnesses. There are two questions to which I should like to draw your attention. Have your Association been able to form any opinion on the effects of this additional requirement of gold in India upon general gold prices, and how those effects, if any, would react on the people of India?—There may be temporary effects which may be counterbalanced by subsequent after-effects.

5670. Temporary effects of an adverse sort, disturbances?—Yes.

5671. Secondly, have your Association been able to form an estimate as to the cost to the Government of obtaining the gold?—I do not think it would cost as much as it is feared.

5672. The ultimate cost to the Indian Government would be the cost of raising these credits against which the gold would be obtained, is it not?—Yes.

5673. In the memorandum we sent to you the permanent addition to India's bill is taken to be about 1½ crores a year, if I remember rightly?—Yes.

5674. Have you any criticisms on that calculation which might be illuminating to the Commission?—I personally have no means of judging.

5675. You are not prepared to criticise it. Then let us accept it for the purposes of the discussion. Just one general question to conclude this part of the subject. In view of what you have told us about the possible temporary disturbance to general gold prices, and, secondly, in view of the cost of round about 1½ crores, would your Association consider that, nevertheless, the benefits to be obtained by the adoption of the policy would be worth the cost?—The benefits would ultimately far outweigh these considerations; they would be too great as compared with these minor things.

5676. Have your Association considered what would be the cost to the Budget of the Government of India of a reduction of the ratio from 1s. 6d. to 1s. 4d.?—Yes, they would lose that gain in exchange for the present.

5677. The addition to the Budget has been estimated at round about 3 crores. Do you accept or criticise that figure?—No, that is the correct figure so far as the present circumstances are considered.

5678. The adoption of your two proposals then would put an additional burden on the Budget of about 4½ crores, 3 for the ratio and 1½ for the currency?—Yes. That is a probability after all; perhaps it may not be anything.

5679. When you are dealing with the future you are always dealing with matters of probability?—Yes, but these questions have more to be considered from a hypothetical standpoint, we cannot say exactly.

5680. Exactly; we are putting forward hypotheses which is just the difficulty of the subject. There are so many hypothetical considerations. Putting forward this hypothesis, that it will add 4½ crores to the Budget, what do you think would be the reactions of that socially and politically when it is necessary to raise fresh taxation. Do you think the people of India would accept these benefits at the price of 4½ crores of fresh taxation?—But I think Government revenue will be compensated from other sources by an increase in the prosperity of industry and agriculture. The sum total of prosperity in India so far as agriculturists are concerned would exactly, in my opinion, counterbalance these 4½ crores.

5681. Would that be an immediate effect?—Yes, during the course of 1 or 2 years that will be the effect.

5682. If the adjustments are so swift, I am afraid on the other side of the question we might have to contemplate that the adjustment of the loss of those benefits to the cotton trade, which you anticipate, might be equally swift, hy a rise in prices and a movement for higher wages, and so on?—On the contrary, I think prices will be reduced, and there will he good sales, and there won't be any competition from foreign countries against an adverse exchange.

5683. It seems to me as if in the argument you want to have it both ways. You think that the adjustments which will relieve the Government of India will be swift, but similar adjustments which might be expected to cancel out the benefits to the cotton trade will not be swift. Would it be prudent to anticipate that one would be so fortunate as that —that circumstances would work out entirely in that way although they might be expected to be similar in the two areas?—We cannot definitely say that.

5684. One point of detail upon which your opinion will be of value is under question VIII, where you say: "If the currency system be made automatic by the introduction of the gold standard as said above there will not be any great necessity to issue special currency to meet seasonal demands." I do not quite follow that. Generally one is inclined to suppose that the more gold there is in circulation the more inelastic the currency is, and the more it needs special provisions to ensure seasonal elasticity. Why do you think that the introduction of the gold standard on the measures proposed by you would make it unnecessary to make provision for seasonal elasticity?—Because a standard of automatic contraction and expansion of currency will be established and that will not require special facilities, certainly not in the second stage, there may be a necessity in the first stage.

5685. At first there is the gold exchange standard?—Yes.

5686. But I am referring to the second stage?—No, I mean the immediate stage after the establishment of the gold standard.

5687. I see. The first stage is when gold is going into circulation; you are looking forward to the second stage when gold comes out of circulation and is replaced by notes. You quite rightly say there will be a more elastic currency and you trust it will be unnecessary to have any special provision, although in most countries it is usual to have a special provision for this purpose even under those conditions?—It may be kept up, but there cannot be any special necessity for it afterwards. I have put down the words "any great necessity."

5688. I see it is worded with some caution. What, in your opinion, is the best way of providing for seasonal elasticity under a gold exchange standard? You are aware, no doubt, of the present provision?—Yes, 12 crores, I think.

5689 Yes, 12 crores against bills. Have your Association any proposal to make for any change which, in their opinion, would lead to the improvement of those provisions, or are they content with them as they stand?—No, there should be further powers with the Governor-General in Council to issue to the extent of 7 crores further in case of emergencies or crisis for a temporary purpose only.

5690. You would enlarge the amount?—Yes.

5691. You have no recommendation to make as to the nature of the securities against which the additional currency is to be issued?—They may be issued so far as the crisis is concerned only; as soon as the crisis is over they may be again withdrawn.

5692. They would withdraw themselves?—Yes.

5693. It is the nature of the securities against which the currency is issued?—Yes.

5694. Just one more question and that will conclude the questions with which I need trouble you. Under question VI you say, "If necessary with the gold standard it will be easier to import foreign capital for industrial purposes"?—Yes.

5695. Let me ask you to make the assumption that, by means of a perfected gold exchange standard system, the rupee has been restabilised in relation to gold as it was before the War at 1s. 4d. If you have attained stability of exchange you have attained, as we understand it, that condition which is essential for the free import of foreign capital?—Yes.

5696. If you will assume for the moment that that can be attained on the exchange standard system, then this circumstance would cease to differentiate as an advantage between the two systems recommended, would it not?—No, becauso this system has been sufficiently tried and found wanting. The experience of the last 8 or 10 years is not satisfactory to us.

5697. That really means that you refuse, as of course you are entitled to do, to make the assumption which I ask you to make, does it not?—Yes.

5698. A little further on you say: "If the gold standard and gold currency is decided upon, the relation of the rupee to gold coin will have to be fixed for internal purposes; no doubt for external purposes this ratio will lose importance as foreign transactions will then take place in gold. The most natural ratio in India is the pre-War ratio of 1s. 4d. to the rupee." Just to be quite clear about what you mean by that, you do not, I imagine, base upon that any assumption that by the introduction of a gold currency and by the establishment of the ratio of the rupee to gold at 1s. 4d., you can prevent whatever disturbances might result from the shifting from the present ratio of 1s. 6d. to 1s. 4d.?—I cannot understand the question very clearly.

5699. If you are to continue with a gold exchange standard and reduce the ratio to 1s. 4d., that would involve certain readjustments, would it not, in internal prices?—Yes.

5700. Instead of continuing the gold exchange standard you adopt your gold currency system and you fix your ratio at 1s. 4d. to the rupee in relation to the gold mohur. By doing so, do you avoid the disturbances which would be involved on the reduction of the ratio?—There may be some fluctuations.

5701. (*Chairman*.) I think that closes the questions which I wanted to ask in elucidation of your memorandum. I will now ask you to be so kind as to deal with any supplementary questions which my colleagues might like to ask.

5702. (*Sir Henry Strakosch*.) Mr. Patel, in your statement, under question I (*c*), you refer to the competition of Japan in dumping in India cheap goods. Could you tell us what the amount of imports from Japan into India are?—They are about 7 to 8 per cent. of the total.

5703. Of the total imports of the country?—8 per cent. of the total imports of cloth.

5704. And what are the goods that are mainly imported that compete with Indian manufacture?—All coarser count goods.

5705. Is this 7 to 8 per cent. the percentage of the total imports of all kinds of goods? If so, how much of that is cotton goods or any other goods that are competing with goods produced in India?—Are we dealing only with cotton goods or any other?

5706. I ask you how much Japan imported into India of all kinds of goods?—I do not know exactly about that.

5707. Therefore your reference to 7 to 8 per cent.?—Was with reference to cotton goods.

5708. Is it 7 to 8 per cent. of all cotton goods imported or 7 to 8 per cent. of all goods imported into India?—I think 7 to 8 per cent. of all cotton goods supplied to India; that is my recollection.

5709. India is a large exporter of raw cotton?—Yes.

5710. Could you tell us what percentage of India's cotton production is exported into Japan?—Practically nil for the last one year.

5711. Last year there was no export at all to Japan?—To China there were only four bales piece goods so far as I remember; to Japan a very poor insignificant quantity.

5712. Of raw cotton?—Of cotton goods.

5713. I am speaking of raw cotton?—Japan is taking a greater quantity than it used to before.

5714. Could you tell me how much that would be?—I do not know exactly the number of bales. Perhaps Sir Purshotamdas Thakurdas would be able to give that information to me. I do not know exactly the number of bales; but it has increased considerably for the last three years.

5715. Would you say that the exports of raw cotton into Japan are greater in value than the imports of manufactured goods from Japan?—I cannot say that in exact terms.

5716. I understood that it was so, that the export of raw cotton to Japan is far greater than the imports of manufactured goods into India?—Yes. That is a fact because Japan is taking Indian cotton on the one hand and selling manufactured cloth on the other, not only to India, but to Egypt, the Levant, South Africa, Mesopotamia, Turkey, &c.

5717. I suppose you will agree that the price of raw cotton depends upon world prices?—Yes.

5718. And that India has no control over the world gold price of cotton?—Yes.

5719. How much of the total amount expended in manufacturing cotton goods is represented by the value of the raw cotton used for its manufacture in India?—That is in turning cotton into cloth?

5720. Let us say one unit of cotton goods may be one rupee; what percentage of that is represented by the value of raw cotton?—Over 50 per cent. and a little more.

5721. I have a figure before me of 60 per cent.; would you agree with that?—I would agree with that.

5722. What percentage of the outgoings would be for wages?—About 10 per cent.

5723. You agree that cotton prices cannot be controlled from here; if the price of the rupee in terms of gold is settled at 1s. 4d., would you please tell me what the advantage to the Indian cotton industry that would be, and where the advantages come in?—The foreign imports which at present get a 12½ per cent. bounty will be stopped as against the indigenous production. At 1s. 6d. the importer gets an advantage of 12½ per cent. against the indigenous product. So that 1s. 4d. ratio reduces the cost to the extent of 12½ per cent. to the indigenous industry.

5724. But if the prices are adjusted according to world gold prices, how does the advantage arise? I do not quite follow how the advantage arises?—If you fix exchange and prices at 1s. 4d. rather than at 1s. 6d., then every importer has to pay 12½ per cent. more than what he has to do to-day.

5725. In rupees?—Yes, and similarly the prices of imported stuff will be dearer to the extent of 12½ per cent. to the importer and if he competes with local manufacture or local industry, he will have to take into consideration the 12½ per cent. which he has to pay there.

5726. But if you depreciate your rupee to 1s. 4d., then 1s. 4d. will buy proportionately less in the country?—The prices will be lessened in that case.

5727. The prices would rise?—On the contrary, they would be lessened in my opinion.

5728. Surely if the 1s. 6d. rupee bought a hundred units of goods, the 1s. 4d. rupee is going to buy 12½ per cent. less?—Yes.

5729. In other words, 87·5?—That is not with regard to imports.

5730. We have started from the premise that so far as cotton is concerned, the price of cotton is regulated by the world prices?—Yes.

5731. Therefore if your rupee will in future buy 12½ per cent. less abroad then the cotton within the country will be an equal percentage higher?—Yes.

5732. Having regard to that, I do not yet see where the advantage comes in?—I think you yourself stated that the cotton prices in India are governed by America and other cotton prices. So these factors will not act so cogently as compared with ruling American prices; and a sudden rise or fall on account of quotations that are given out in America will affect prices of cotton in India.

5733. They will not move according to American figures?—America will govern prices; India's export and import will not govern prices.

5734. I am sorry I cannot follow that?—Cotton exported out of India or cotton goods imported into India will not be directly affecting the prices of world cotton.

5735. I follow?— While American prices will affect prices of the whole world cotton.

5736. Quite?— Regarding the advantages and disadvantages which have been recently calculated, they

are being originated from the considerations of India's products and export and import. So the calculation of fluctuation in world cotton prices has no direct connection with the calculations of those figures, so far as India is concerned. It is America that fixes all the cotton prices according to its own crops or some other manipulations.

5737. But the Indian price obviously is influenced by the purchasing power of the rupee. If you fix the purchasing power of the rupee at 1s. 4d., that rupee is going to buy 12½ per cent. less cotton than the 1s. 6d. rupee. Therefore with the 1s. 6d. rupee you can buy 12½ per cent. more cotton than with the 1s. 4d. rupee?—But the cotton which we will buy from the foreign countries would be less than the cotton which we would be giving.

5738. I am coming back to the manufacture of cotton goods. 60 per cent. of the expense involved is in respect of cotton?—Yes.

5739. Then, if the cotton price here does adjust itself to the world gold price of cotton, you will be able to buy with a 1s. 6d. rupee 12½ per cent. more cotton than you can buy with a 1s. 4d. rupee?—But so far as India is concerned India is not required to buy cotton from outside to that extent.

5740. I am not speaking of the outside. The cotton millowner in India will buy in India his cotton, and that he will get with a 1s. 6d. rupee 12½ per cent. more than with a 1s. 4d. rupee?—I cannot believe that, as America rules cotton prices in India and not 1s. 4d. or 1s. 6d. rupee.

5741. But obviously it must be so; if you have stabilised your money in terms of gold and if you are depending upon world prices so far as the internal price of cotton in India is concerned, as the value of the rupee increases so you will be buying more cotton in India for it?—But we first assume that the world prices of cotton are being governed mainly by America. Next day there may be a craze in America and the prices would be suddenly fluctuating in India, in spite of all other circumstances remaining in normal conditions in India say 1s. 4d. or 1s. 6d. rupee.

5742. If I may suggest, do not let us confuse the question by assuming fluctuations in cotton prices abroad. Let us say cotton has reached a certain level and let us compare what is the effect upon the millowner in India of a 1s. 6d. rupee and a 1s. 4d. rupee. The effect, as I put it to you, will be that if the rupee is stabilised at 1s. 6d. you would be buying with that rupee 12½ per cent. more cotton than with a 1s. 4d. rupee? The effect as I put it to you will be that, if the rupee stabilises at 1s. 6d., you would be buying with that rupee 12½ per cent. more cotton than with the 1s. 4d. rupee?—I can't agree with that.

5743. But it is a very simple arithmetical calculation. If you will work it out for a given quantity of cotton, I think you will come to that conclusion, because the 1s. 6d. gold rupee will buy obviously 12½ per cent. more than the 1s. 4d.—That is a fictitious calculation, so far as you take 1s. 6d.

5744. Why is it fictitious?—Because we don't base our calculations under the present circumstances on this 1s. 6d. only.

5745. What do you base it on? You must base it on 1s. 6d. because, if you want to buy with the proceeds of your cotton sale goods abroad, you can exchange your rupee at the rate of 1s. 6d. for the rupee. Therefore, you have got to take it into calculation.—So far as this cotton industry is concerned, we are not required to buy from foreign countries. We are depending mainly upon things produced in our country, the labour is in our country, and even the management is our own. There is very little we get from outside for our cotton industry.

5746. Yes, but that does not lead us to the point. You admitted that the price of raw cotton is governed by world prices. If American cotton goes down, the Indian cotton goes down.—Yes.

5747. Very well. I compare what a 1s 6d. rupee would buy internally and what a 1s. 4d. rupee would buy internally. If they are both dependent upon the external price, then obviously the 1s. 6d. rupee would buy 12½ per cent. more cotton than the 1s. 4d. rupee.—Yes, but that theory would not be applicable in my view to the conditions in which India is at present, so far as cotton buying is concerned.

5748. But you are buying all your cotton in India, and with a 1s. 6d. rate you would buy so much more cotton in India?—That I don't believe. Because there is no inter-relation regarding India's buying of Indian Cotton between international countries in this buying and selling. If we have to export our goods to some foreign country, then it would have some effect, in my opinion.

5749. (*Sir Henry Strakosch.*) Then I am afraid we cannot agree.

5750. (*Chairman.*) It comes to this, that you must have two world prices for the same commodity: one price in America and another price in India?—Yes.

5751. (*Sir Henry Strakosch.*) Then I come to another question and I refer to the passage under question VI in which you say "India has been considered a sink of precious metals by the West. It is no fault of the people of India if they are led to this practice, because they cannot have any confidence in the unstable token rupee." Would you agree that it is desirable for the people of India to put their savings into things of a reproductive character rather than in precious metals?—Yes. It is desirable and it is necessary.

5752. And if India succeeds in educating her people to invest in such securities she will be saved having to import capital from abroad?—The importing of capital from abroad will be necessary in certain stages.

5753. Quite, but to the extent to which the savings are put into reproductive things, her requirements for capital from abroad will be diminished. Now, what I can't quite follow in your statement here is this: that it should be necessary to give the people gold instead of the present token rupee. If it is desirable that the people should put their savings into economical things, then it does not matter whether it is a token rupee or a gold coin. Both are undesirable, you will admit?—Yes.

5754. Well now, don't you think that the more logical way of tackling the question would be to educate the people to save in things other than precious metals and not give them precious metals? You, in fact, induce them to retain precious metals of the very kind that they are coveting most, namely gold. Is it not more logical that they should be first taught to invest in things other than precious metals, and that they should then be given the gold when the gold will do what money in other countries does, namely form the medium of exchange?—In my opinion, I think, so far as India's circumstances are concerned, it is putting the cart before the horse. You will find that 70 or 80 per cent. of the people are agriculturists and they are quite ignorant of all these things, so they are simply subject to prejudices and sentimentalism. As soon as there is the least doubt or as soon as there is the least fluctuation, they think perhaps the Government is to go, perhaps something is to happen, and they will go for getting in gold that they can cover up. So before educating them to the reality of this idea, it is necessary that they should be, by practical steps, brought to the level of understanding, first that gold is available to them whenever they require it for their use. This confidence between the masses and the Government should be first created. After this confidence is established, after the practice of say ten or fifteen years, people will not go in for hoarding gold to this extent. They will then naturally change their attitude when they find that whenever they require gold they have only to go to the currency office or to the Government, and for silver coins they can get gold and for gold they can get silver. So that, this very effect on the minds of the people, so far as

they are ignorant at present, could be removed by offering them bread against bread, not stone against bread. Though logically, your way is the correct one, and I quite approve of it. But that would do in a country where there is good education. But in a country like India where education is so backward and where even the greater majority of the people do not understand their rights the only safe way is to win over their confidence by allowing them to acquire gold at any time they desire and then as a consequence thereof they will be getting practical experience on the one side and they will be educated in this subject on the other side.

5755. But tell me, who hoards the gold that is being imported now? Is it all held by the agriculturist or is it held mainly by the wealthier and more instructed class?—I think it is held in greater quantities by agriculturists and those other people who are not educated—the quantity is greater with them.

5756. But we have been told by other witnesses that the demand for gold by the ryot would be very small because he is too poor to acquire gold and that the gold is mainly needed for the richer and therefore more educated classes.—Yes. I mean there is a certain section of the middle classes. They are required to have gold ornaments and gold things in view of certain caste customs and practices and so on. Even at the cost of incurring debt they have to go in for getting gold and gold ornaments.

5757. That is more or less like other countries.—Then secondly, so far as these ignorant agriculturists are concerned, any temporary saving they make they immediately invest in gold or silver.

5758. Yes, but they buy mainly silver, because they are too poor to buy gold.—But if they get a little more money they will go in for gold. Some of the better-off villagers go in for buying gold and they even put it underground so that nobody may take it away as they have no confidence in banks or other people.

5759. But to revert to this method of procedure, it is after all merely a question of choosing which method is the more effective to educate the people in the habits of saving in things other than gold. You will admit, I think, that one can have two opinions on that subject?—Yes.

5760. There is one view which you support, namely that it is necessary to first saturate the country with gold and that, having done so, one may hope that the people will invest.—Yes.

5761. And the other view is that it is more desirable to show to the people from the very start that it is not desirable to hoard gold and other precious metals, that they would do better by putting their savings into other things.—But perhaps they may take a wrong view of the suggestion. If you ask them not to hoard gold, they will think perhaps that these people are trying to mislead and they will on the contrary go for buying more gold.

5762. Now, I want to go a step further. If one views the good of the whole of India, has not one got to set against these two alternative methods of education, what the price of each method would be and what dangers the one involves and what dangers the other involves? And if you finally came to the conclusion that the dangers and the expense of the one method are far greater than the other, would you not consider it a reasonable proposition to say "Well, let us first try "—because there can be a doubt as to which of the methods is the better one—"the method that is least expensive and involves the country in least danger."—Yes.

5763. Would you admit that?—Yes.

5764. And if that was so, would you see any very great objection to a true gold exchange standard under which you would have a token currency internally not convertible, but freely convertible externally. That is to say, you should be able to convert your rupee into gold and gold into rupees for export. And at the same time establish a system which will be truly automatic. In other words, you would have a gold standard in the true sense with this exception that gold would not circulate internally?—That in my view is not the correct theory. You must first go from the bottom.

5765. Yes, but I want to put to you the two propositions. I said the one is costly and possibly dangerous, the other in its monetary effect is the same as the gold standard except that you have no gold in circulation. Which would you choose?—In my opinion it is better to select a costly method when its foundations are very strong instead of preferring a less costly method in which the foundation is shaky and when the building is going to fall within a very short time.

5766. Even though the ultimate effect would be to educate the people to put their savings into the very reverse of what is desirable?—I don't think you can educate the people in a hundred years by taking that line, but by offering them practical measures in the form I have suggested you will be educating the people by creating confidence and improving their position within ten or fifteen years.

5767. Could you tell me to what extent the note circulation has increased during the last twenty years? To what extent the post office savings bank deposits have increased; to what extent cash certificates have increased?—They have.

5768. Well, do you see in the figures of these increases anything to support your view that it is necessary to have a gold currency to induce the people to save in forms other than precious metals?—Yes. But these investments have been made on account of higher interests offered to them and greater securities as compared with other securities.

5769. It does not matter. I am speaking of the highest class of securities and the highest rates of interest. But is it not the fact that the note issue has increased?—Yes.

5770. Savings banks deposits have increased?—Yes.

5771. And cash certificates have increased?—Yes.

5772. In other words, that the habit of the people to save in things other than precious metals has increased?—But the imports of gold have increased; how could you account for that, side by side?

5773. Well, if you take it over a period, I should say that the imports of gold have remained pretty stationary, if you take the last 20 years?—In that case I have reasons to believe that that investment is diverted from industrial investment to these post office and other types.

5774. But it is investment?—It is a transfer from one entry to another entry. If I take money out from the Imperial Bank and deposit it with the Central Bank, it is not a habit created in me, it is simply a transfer.

5775. You suggest therefore that during the last five years India has not put more capital into industry than before?—They might have put more capital but the capital has been diverted from industries to the Government side. Instead of remaining fixed to the industries, the capital has been diverted from industries to Government securities, etc.

5776. Unless foreign countries have brought these industrial shares, no diminution of saving in securities has taken place? Have you heard of any great sale of Indian securities abroad?—I talk of the local conditions.

5777. Very well, if one Indian sells his shares to another Indian, you do not diminish the amount of money invested in securities?—But I do not get the habit of investment thereby.

5778. Well, I submit that the increase in the note circulation, post office savings deposits and in cash certificates is an indication of an increased tendency to save?—So far as the securities on Government side are concerned, I do admit that.

5779. (*Sir Maneckji Dadabhoy.*) My colleague, Sir Henry Strakosch, has questioned you regarding the increase in post office Bank deposits, and other kindred deposits, Government securities and so

forth; are you aware that those deposits are mostly made by a particular class?—Yes.

5780. They are made by clerks, middlemen, men drawing smaller salaries both in Government and commercial offices and they are a special class of people?—Yes.

5781. While the saving in gold are largely made by well-to-do people as well as by large classes of agriculturists?—Yes.

5782. You are aware that in 1924, last year, nearly 79 crores of gold was imported?—Yes.

5783. How do you account for that demand?—That is all absorbed in the country.

5784. And that demonstrates that the habit of the people or rather the attachment of the people for gold is getting stronger than ever?—Certainly.

5785. And that they consider gold as the most stable sort of investment?—Yes.

5786. My colleague also asked you some questions about Indian cotton. Have you any idea as to what quantity of foreign cotton is imported into India?—As compared with the local indigeneous product, I think it might be about one-fortieth or one fiftieth of it.

5787. It is only for the purpose of manufacturing the higher counts of yarn that cotton from South Africa, Egypt and America is imported?—Yes.

5788. And that the bulk of our cotton purchases in India is made by rupees only?—Yes.

5789. And that whether the exchange value of gold may be 1s. or 1s. 4d., so far as the internal payment is concerned it makes no difference?—Yes.

5790. It would only affect foreign stuff so far as cotton is concerned whether the ratio is 1s. 6d. or 1s. 4d., it would only affect foreign imports and has no effect whatever on local purchases, internal purchases?—Yes, certainly.

5791. I am rather confused over your reply to the Chairman about the Imperial Bank. You said that the Imperial Bank should have full control but it should also have an advisory Board with non-official members, and you recommend that a part of these members should be taken from professors, others from commercial communities and partly from the Assembly? Would not a constitution of that nature hamper the work of the Imperial Bank than facilitate the smoother working of the Bank?—In certain matters it may so hamper.

5792. Don't you think that from the Bank's point of view it would be absolutely desirable to detach all politics from the management of the Bank?—Certainly, it is an imperative necessity.

5793. And on that ground would you not reconsider your views about the appointment of members of the Legislative Assembly on this Board? Would you not consider that suggestion as inadvisable?—I am not so keen over that. I am keen over the selection of the Board from the best brains in this country.

5794. It would be safer to keep the Bank transactions absolutely free from politics and allow no politics to influence in any way the progress of commercial business in the country? Yes.

5795. And therefore on reconsideration you would not recommend the appointment of Members of the Assembly?—In that case, members from bodies such as the Chambers of Commerce or Indian Merchants' Chambers, that have already established good repute may be appointed.

5796. Do you not think that the Bank, left to itself, and controlled by men trained for years together in banking knowledge and information would be better able to manage the business than any outside body?—But outside advice is sometimes more useful to such people.

5797. But is it not open to them at any stage to take such advice, why make it statutory? It is always open to a Bank managment to obtain outside advice?—I have not heard such examples in this country where voluntarily such effective advice has been sought for from other bodies unless there is some provision that they should do it in particular circumstances.

5798. You do not mean to tell me that the Head of a Bank in India, say in Bombay or Calcutta, never takes outside opinion about certain trade matters?—I am sure you are aware that a large number of brokers always go to the Bank and see the head man, that large classes of respectable people for financial purposes resort to the Banks and the Head of the Bank has often long conversations on various aspects of trade with these gentlemen? Do you not think that that is an adequate machinery for the obtaining of information which you think ought to come from the medley body like the one which you suggest?—I think an advisory body is a necessity.

5799. (*Mr. Preston.*) You say as No. 1 of your conclusions that you are of opinion that the gold standard is the best system of currency for India, and your reply to certain questions Sir Henry Strakosch put to you might lead one to believe that in the attainment of that ultimate goal you are prepared not only to pay handsomely for the privilege but to wait for a certain amount of time?—Yes.

5800. Might I ask what number of years you would give for the course of progress to be achieved until we arrive at such an accumulation of an amount of gold as might be held to be large enough to commence a real gold standard? Would you allow a period of 15 or 20 years? What is your idea?—I would allow the declaration to be made immediately.

5801. That is, that you are going on to a gold standard? In the acquiring of an amount of gold sufficient as may be considered necessary to make a first attempt, how many years would you allow to intervene before such an important declaration could be made?—I think Government can safely do it within one year; they can make a beginning at once within one year.

5802. (*Sir Henry Strakosch.*) You mean undertake the legal obligation to pay?—Yes, but we have got to give the Government an option at the same time.

5803. You said before that in 10 years the country might be sufficiently strong to adopt the full gold standard and the legal obligation to pay out gold?—But I did not mean that we should defer action till 10 years. My idea is to begin the action, and within three to six years there will be stability and good running of the whole thing.

5804. The obligation to pay gold would begin a year after?—Yes, but the option will be with Government, how much to pay and by what method to pay. Suppose people rushed forward with rupees to convert them into gold, in that case Government might have certain restrictions.

5805. (*Mr. Preston.*) There is no intention on your part to allow the old gold exchange standard to function until that time when the country does absolutely feel itself in a sufficiently sound position to take on this legal obligation?—Yes, but subject to taking this legal obligation within one year.

5806. But you are firm in your idea that you would be strong enough within a period of one year from the time the notification was made to have sufficient gold accumulated to accept all or any obligation which would come to the country under your scheme?—But there may be different limits. We would like to authorise Government to fix limits and to prepare themselves to begin the scheme from the next year as it were. We do not want to give more time, say 10 or 15 years to make full preparations and then to defer action for beginning then.

5807. It is possible of course for Government to declare that they ultimately desire to get on to a gold standard, but they may also make a reservation that having in view the enormous cost to the country, it would be absolutely necessary that the operation should be spread over quite a long period of years, and that was really the reason why I desired to get from you an idea as to when you would consider this country was sufficiently strong to undertake that legal

obligation, which you say now you consider they would be quiet capable of doing within one year. There is one more question with regard to the matter of Council Bills. Do I understand that it would be your intention not to sell Council Bills beyond the Government's annual requirements?—Yes, so far as their home charges are concerned.

5808. That would mean that you would only sell the actual amount of home charges and nothing beyond?—Yes, nothing beyond.

5809. You would limit the sales of Council Bills to the actual amount of home charges?—Yes.

5810. So that in the operation for additional currency in a busy season the procedure would be that gold would have to be tendered in London for rupees through the Currency Reserve here in India? Is that what you have in your mind's eye?—Yes.

5811. I will repeat it so that there may be no misunderstanding,—that all amounts sold above the actual amount of home remittances shall be by a process of gold tendered in London and operated through the Currency Reserve and currency delivered in this country?—That would not be necessary in all the cases because there would be forward buying on the part of the Secretary of State.

5812. That is apart from this one particular operation; but in the case of a bank desiring to obtain local currency in a busy season you would say "I will sell you no more council bills"; Then how is the additional currency to be obtained. Then they say "we are prepared to give you gold; you give the equivalent amount in local currency in India"—That is really what you mean?—Yes.

5813. (*Sir Alexander Murray.*) Mr. Patel, you said in answer to the Chairman, I think, that a low exchange is advantageous to India?—Yes.

5814. It is equally advantageous to other countries; is it not?—Yes, I think so.

5815. Why did Germany who had a very low exchange for a while get off that low exchange?—The position of Germany on account of war conditions was altogether upset. It was in conditions which were not normal. Germany was in abnormal conditions and it had to reconsider the whole question.

5816. Then why should France and Italy make such efforts also to get off the low exchange on to a higher level?—Because France is under a very heavy debt and it could not sufficiently cope with the situation.

5817. If low exchange is advantageous why should they want to keep off the low exchange?—That depends upon the international relations of creditors and debtors. When a country is in debt to a very great extent, it has to adjust its things in accordance with the position of the creditors and the demand of the creditors.

5818. But most people say that low exchange means high prices and high exchange means low prices. If high exchange means low prices, will you not prefer high exchange with low prices internally?—No. My point is this, that if we have low exchange then India is to be benefited from both sides, from the point of view of agriculturists and from the point of view of industrialists. If there is a higher exchange then it is to lose on both sides.

5819. India will have the benefits from its agriculturists' point of view and also from its industrialists' point of view as a result of low exchange?—Yes.

5820. Because both are producers?—Yes, one is the producer and the other is the manufacturer; so far as the manufacturer is concerned, the importer of the foreign goods does not take advantage against him. So far as the agriculturist is concerned, his agricultural produce fetches him good price.

5821. What about the consumers?—Consumers also have to pay lesser prices. Consumers will have to pay lesser prices in that case because gradually the level of prices will be getting down through stabilisation.

5822. High exchange means low prices and then the consumer will benefit, won't he?—Yes; that is in the first stage; but when there is stabilisation and normal conditions are established it is different. To-day for example if at 1s. 6d. certain quantities of articles are imported, the industrialists here will also be put under a disadvantage. But if the exchange goes to 1s. 4d., in that case the prices here will be automatically gradually reduced; because industrialists will be making profits instead of losses and they will see their way to reduce the prices. That is an indirect way of reducing the prices.

5823. Then you think that it is the imports from other countries that are reducing prices in this country? It is not the high exchange that will reduce the price?—It does reduce.

5824. That is what you want, lowering of prices.—No; we do not want prices to be lowered by the imports but governed by the internal conditions in India.

5825. But then you say that exchange and prices react on each other to such an extent that the exchange influences the course of prices?—Yes.

5826. And if the cotton goods coming from other countries as a result of high exchange are causing prices in this country to get lower, that is an advantage to the people as a whole. Is it not?—Why? On the contrary, in my experience, if we look to the figures when the exchange was 2s. 11d., the prices of certain kinds of cotton cloth were nearly double what they are to-day. So India has not gained.

5827. But taking this cotton cloth which is manufactured in three ways I take it—that is the cloth made in India—the Swadeshi kapra; there is the Indian mill production and there are the imports. Have you any idea of the proportions in which these three kinds of cloth are used by the people of India as a whole, that is the Deshi kapra, the mill produce and the imported cloth?—Imported figures, so far as I remember, for the last year were 83 crores.

5828. Can you give me in percentages?—Local mill production was about 59 crores.

5829. That is not the figure that I have got, Mr. Patel. I am taking the figures from the latest Review of the Trade of India, Sir Purshotamdas will correct me if I go wrong, and they show that the production in Indian mills of cotton piece goods in 1923-24 were 170 crores of yards?—I am talking in rupees.

5830. I am talking in yards?—I do not remember in yards but I remember in rupees.

5831. I will give you in yards.—But the value will be a more reasonable consideration.

5832. If you are dealing in yards, it will be a much more reasonable way of doing it.—To deal in yards is more fallacious. When a cloth is made of higher counts and when you take the yards into consideration, it won't help you.

5833. I have not got the money figures; but I have got the yard figures here.— But I will give you the money figures. 83 crores of imports and 59 crores of local mill production. I cannot say about the Deshi kapra.

5834. Deshi kapra is getting bigger as the result of Gandhi cult?—I think Deshi kapra is on the contrary getting low. The handloom cloth is gradually increasing.

5835. Does one balance the other?—Yes, I think so.

5836. Don't you think that part of the trouble in India at the present moment as far as the cotton mills are concerned is due to over-production?—Certainly not; because India has got sufficient scope to double its present industrial production.

5837. I quite agree. But as regards the facts, in the pre-war days, as far as I can see, the Indian mills were only producing 110 crores of yards, whereas now they are producing 170 crores of yards?—In how many years?

5838. I am speaking of the pre-war average. It was 110 crores and the present average is 170 crores. Well, that is a very material increase?—Certainly. But I would like to compare also with tho figures of import for the same period.

5839. I will come to that just now. Now the cotton mills in Lancashire are just suffering as badly as the Indian mills?—Yes; but I do not think they are so badly pressed as the Indian mills are.

5840. In what way?—In every way; in the cost of production, in taxation, in facilities for financing and so on.

5841. But let us deal with production. Cotton mills of Lancashire have found it necessary to come down to a four-day working per week. You have not? —No; we have not.

5842. Would not that make a very material difference?—I think it would have led mills to go into liquidation here because foreign imports would have been considerably increased and we would have permanently lost our own markets.

5843. So that you think it better to run your mills full time making losses than to close down, going into liquidation and reconstructing on a lower basis? —Yes; instead of losing the market from our own shores we would rather go to that corner.

5844. Now these imports from other countries, according to the figures that I have here, in the pre-war days averaged 263 crores of yards and that has dropped now to round about 148 crores of yards. —But is there no difference in the texture? As I suggested previously yardage is fallacious. If the value of 148 crores of yards is greater than the value of 263 crores, probably we will be led to believe that it has increased.

5845. I think we can as well deal with yards in the meantime. I find that whereas the Indian cotton mill production has increased 54 per cent., the imports have actually decreased 44 per cent.—Perhaps from the figures of yardage; but not from the figures of value.

5846. Relatively, the figures must be the same whether it is yardage or value.—It is so technically. Suppose you import a very fine cloth of 80s. and 100s., this one piece may be worth Rs. 16, though the yardage may be 24 and in the other case the yardage may be 40 and the price will be comparatively much less, say 6 only.

5847. But that was the case in the pre-war times too.—I agree so far as the yardage is concerned.

5848. You say the high exchange has enabled other countries to sell at cheap rates in India. As a matter of fact on the figures, instead of sending any increased imports, they have sent very much less imports and we are now importing 148 as against 263 crores in the pre-war years.—So far as the yardage is concerned, yes. But what about other countries that have imported into India? Have you taken the totals for all the countries?

5849. Yes. I am going to deal now with Japan. Now Sir Henry Strakosch asked you what the percentage was of the Japanese cloth coming to this country. I think something like 8 per cent. of the imports of cotton piece goods come into this country from Japan?—I think I made that statement.

5850. I think that is the figure. Is that correct, may I know?—Yes.

5851. Well now Japan is 8 per cent. of the total imports, but of the total imports and mill production put together Japan is not more than about 3 per cent.—The total production for India?

5852. I am leaving out the deshi kapra now but I am going to show that if you take the Indian mill production and if you take the imports from all the countries and add them together, what percentage does Japan bear to that? It is only something like 3 or 4 per cent. And if you are including the deshi kapra in that I think it reduces the Japan figure to probably 2 per cent. or something like that. Now do you mean to tell me that the Japanese import figures of 2 per cent. are of such very great importance in the cotton industry as to justify us in recommending that exchange should drop from 1s. 6d. to 1s. 4d.?—In my view the comparison of figures on this system is rather a jugglery. We must take the practical view and the practical effects which are being experienced in the market so far as the products are concerned. I will explain a little further. Japan is manufacturing those sorts which are mostly produced by Indian mills, so the competition with Indian mills is practically to a great extent from Japan rather than from other countries, and that is why we are making a row. It is Japan that is competing with us and driving us out of the market.

5853. Quite true but even so the Japanese figures are only 8 per cent. against 92 per cent.—Of course if you want to go to the extreme of dividing by percentages there are 330 millions of people in this country; you would have to see the average per head and find out some insignificant figure.

5854. I was only going to show that the Japanese figure is 8 per cent. against 92 per cent., 8 per cent. of the total imports. What does that mean, the Japanese figure against your figure?—Have you got the figures of Japanese competition against local mill products, what is that percentage?

5855. Just let us take that; it will be very interesting. It is about 7 per cent. I think.—Against the total mill production here? Yes, the Japanese imports are about 7 per cent. Is there any special classification between local manufacturers, fine counts and coarser counts?

5856. No they only differentiate between grey goods and coloured goods.—What is the percentage between the grey goods and Japanese competition?

5857. Well chiefly the Indian mills produce, as you know, grey and bleached goods; and the Japanese imports are also chiefly grey goods.—So there the incidence is greater so far as the grey goods are concerned?

5858. I will give you the figures there too. No it is only 8 per cent. But the point I really wanted to make was that while one generally admits that it is the marginal amount that is available for disposal that influences the price of an article, do you really think yourself that it is the very small percentage of Japanese goods that is now coming into the market that is responsible for the present bad state of the Indian cotton mill industry?—It is responsible in my view because in so far as practical business experience goes we find that if one particular sort or say 4 or 5 sorts of the total production are sold very cheap in the market, then other sorts are also affected and the general level of prices is reduced. That is how even the 8 per cent. competition from Japan makes itself effective.

5859. Even allowing that, in connection with a difference in the exchange rate, you say that " when the exchange is definitely stabilised at a certain figure for a long time, prices in the long run adjust themselves, and things go on in a normal fashion." So that eventually it won't matter whether it is 1s. 6d. or 1s. 4d.?—But that is subject to prices remaining at 1s. 4d. I have qualified my statement.

5860. You make a statement; then you say for certain reasons it should remain at 1s. 4d.; but that does not qualify the general statement that eventually it does not matter whether the exchange is at 1s. 4d. or 1s. 6d.—If it is 1s. 6d. then the whole system will be again disturbed.

5861. But it is 1s. 6d. now.—It has been disturbed.

5862. Therefore we are disturbing it again by going back to 1s. 4d.?—In that case no doctor should treat a patient. If there is a disease we have to treat it.

5863. (*Professor Coyajee.*) Mr. Patel, you have been connected with the Ahmedabad mill industry for some years?—For the last 12 years.

5864. Are there any official statistics of the annual profits or annual amounts carried to reserves?—Yes, I think they are published in the Millowners Association Report of Bombay so far as Bombay is concerned.

5865. Annually?—Yes, annually.

5866. Now as an expert could you suggest what the average profits of some of these mills are, the average profits earned by your mills in Ahmedabad between 1914 and this year. Could you give us that? —Well I think the profits for the period from 1920 to 1924 might be far higher than the profits realised during years previous to that.

5867. What would they be on an average between 1920 and 1925?—The average with the previous years' profits?

5868. No, I mean in these five years?—In these 5 years they have gone up to the extent of about 100 per cent. but at the same time I have to explain this from a different standpoint. The system of starting mills in Ahmedabad is quite different from the system of starting mills in Bombay and Lancashire. In Ahmedabad the general system is that we depend much upon outside local credit. Therefore a mill would be started in Ahmedabad with a capital of say 3 or 4 lakhs; in Bombay the same mill would be started with a capital of about 10 lakhs and in Lancashire perhaps a mill with the same looms and spindles would be started with 15 lakhs. So in Ahmedabad I may give the instance of one or two mills, the Shorrock mills or the Ahmedabad Sarangpur mills. The first is a big weaving and spinning mill but the original capital was only 325 shares consisting of Rs. 3,25,000; so the money required for working as well as for extensions was brought by the system of credit by dividing agent's commission among the different partners and obtaining deposits. Now all this capital went to finance the whole mill and all the profits that were realised by this big mill went as dividends to these 325 shares worth Rs. 3,25,000. What I mean to say is that if that big mill even made a profit of Rs. 3,25,000 it could very easily distribute a dividend of 100 per cent., which would not be the case in Bombay, much less in Lancashire. So the calculation of percentage of dividend in one centre is not a real or true guide to be compared with other centres or other places. So when I said there were 100 per cent. profits in the Ahmedabad mills, I do qualify my statement by saying that it does not mean that the profits were made in ordinary circumstances, but under the special system in which the finances are sustained and the mills are established.

5869. Now for the same period could you tell us what percentage on an average was carried to reserves besides this distribution of profits?—I think the same amount might have been carried into the reserves; perhaps more but not less.

5870. Now you have got the managing agent system in Ahmedabad also?—Yes.

5871. How are the profits calculated. I would submit that the fees of the managing agents are not calculated as profits?—No they are debited to expenses.

5872. They are a part of the cost of production?—Yes.

5873. In other countries they would be called profits?—I don't agree with that because in debiting them to expenses as I have stated previously they do not go to the agents but to the partners of the agency firm who have financed the agency with funds; so like the shareholders the agent has to divide some of the profits which he realises from the mill. At the same time there are certain provisions in practically all mills that they have to let go part of their commission in lean years, and even in spite of these conditions last year some mill agents relinquished the whole of their commission when the mills were not in a position to pay dividends.

5874. In general the managing agent's commission is not considered part of profits?—No on account of these special circumstances, also they have to let go their commission in certain circumstances when there are no profits.

5875. Let us take the first 20 years of this century. Could you give us some idea of the average profits earned during that period?—For the whole period of 20 years ?

5876. Or any convenient period which might suggest itself to you as useful to be taken as one unit for calculating profits.—I think from 1900 to 1914 we may calculate the profits at the rate of 10 per cent.; from 1914 to 1920 we may calculate to the extent of 125 per cent.; and from 1920 to 1924 to the extent of, say, 70 per cent. I am talking of the average for the whole period for those years.

5877. (*Sir Rajendranath Mookerjee.*) Was it the same in Bombay?

5878. (*Professor Coyajee.*) He is talking of Ahmedabad?

5879. (*Sir Rajendranath Mookerjee.*) I want to know if it was the same in Bombay.—I think the same figures might be applicable to Bombay also.

5880. (*Chairman.*) How many companies are there in your Association, Mr. Patel?—About 75 mills and other kinds of factories.

5881. Are they 75 different concerns?—They are mostly cotton mills; about 56 cotton mills.

5882. Do they publish balance sheets and profit and loss accounts?—Yes, Sir.

5883. Severally?—Yes, each separately.

5884. They do not publish any general return for the Association?—No, we have no such return though we have in our files for the last 2 or 3 years balance sheets from several mills.

5885. Are those published balance sheets and profit and loss accounts obtainable?—They may be obtainable from the Registrar of Companies.

5886. But not from your Association?—I can consult my committee and give a final reply to that.

5887. Thank you; it just occurred to me that it might be of interest to some of my colleagues?—I shall let you know.

5888. (*Sir Norcot Warren.*) Mr. Patel, you suggested in the course of your evidence, an advisory board for the Imperial Bank. You know they have got a Central Board already?—Yes.

5889. Consisting of nominated Governors and Governors elected by the shareholders, a Government official and two managing Governors. In what way do you suggest that your advisory Committee would be an improvement on this Board?—Because the working of the Imperial Bank so far has not been in the eye of the people so successful as it ought to be.

5890. What do you mean by that?—The Imperial Bank has done rather the work of collecting money than of lending money in the interests of industries and the public.

5891. That I deny?—And also in my opinion the Alliance Bank affairs; I would not like to touch upon that now.

5892. What has the failure of the Alliance Bank got to do with it?—That creates an impression in the public mind.

5893. What impression?—That there should be some advisory board to guide this bank.

5894. But what has the failure of the Alliance Bank got to do with the Imperial Bank?—Well, certain assistance was given in a manner which was not very well liked by the people.

5895. (*Sir Norcot Warren.*) But you have not answered my question: how do you suggest your advisory board would be any better than the present Board? Where would you draw your men from? What class would you draw them from?

5896. (*Chairman.*) I think he has said he suggests a board consisting of somebody from the academic world, somebody from the business world, and a Government official.

5897. (*Sir Norcot Warren.*) How would a member from the academic world be an improvement on the present board?—So far as the theoretical part of the whole thing is concerned his advice may be useful.

5898. But there is nothing theoretical about lending money?—The whole system of currency and exchange is first based on theory in my opinion.

5899. But it is not worth much if you do not have practice too?—In that case they will work as dead letters on the board, and the board will not lose anything by it; in any case of emergency they may be consulted and their advice might be useful.

5900. I cannot say you have answered my question as to where the improvement comes in. What better men can you get?—I think the opportunity of getting better men will always be open to the world. If we hunt for men we will be able to get them. We should not feel that a particular limit has been reached in the world, in my opinion. If you seek for other people I think we shall be able to get more active people.

5901. You do not call the present Board active?—I do not say that, but I say that other active people can be found.

5902. Why should they be better?—Why should they not be better? It is my opinion that if we can get better men we should try and get them.

5903. (*Chairman.*) Apparently the witness is thinking of going farther and faring better.

5904. (*Sir Purshotamdas Thakurdas.*) Did you say there were 75 mills in Ahmedabad?—Including oil factories and such like.

5905. Cotton mills?—About 56.

5906. Your membership therefore is 56?—So far as the cotton mills are concerned.

5907. And Ahmedabad happens to be the next most important place not only in the Bombay Presidency but in all India regarding activity in cotton industry?—Certainly.

5908. Could you tell me if the personal information of members of your committee is restricted to management of cotton mills or whether it also extends in the sphere of the exchange market and the bullion market and the other concomitant factors which go to make one fit to discuss the exchange question?—Their direct connection is as far as the working of the mills is concerned; but at the same time when these questions do crop up, they have to look into the subject and to frame their opinions.

5909. You have followed the questions with intelligence as an ordinary layman, but you have not, nor do you claim for your committee any expert knowledge regarding the exchange questions?—Certainly not.

5910. Nor do I take it that you yourself claim any expert knowledge in connection with these matters?—Nothing beyond my lessons in political economy when I was in the B.A. class.

5911. That must have been some years back?—Half a generation back perhaps.

5912. I also see in your written statement that you refer with regard to certain views of your committee, to Mr. Madon and his rather exhaustive literature, and it appears that you have gone on such information that you have got from such publications?—Certainly.

5913. To that extent, therefore, your examination in the Commission regarding the exchange question and the reverse councils and all that must be taken with the necessary reservation that you have not that expert knowledge at your command?—Not practical knowledge.

5914. Nor of day to day handling?—That is so.

5915. You have stated to Mr. Coyajee the dividends that your mills paid during the last five years. If I remember correctly you said during 1900 to 1914, the average mill dividend has been 10 per cent.; from 1914 to 1920 I think you said it was 125 per cent.; and from 1920 to 1924 it was 75 or 80 per cent.—75 per cent.

5916. I would like to know whether you said this as a sort of guess or as the result of any actual tables prepared by your Association?—I have already made a statement before Mr. Coyajee, that I have not got any statistics ready with me. This is guess work which I just formulated considering the general factors.

5917. May we then put it on record that the figures you have given are pure guess work, but that in view of your intimate knowledge of these affairs your guess work may be taken as an approximate guess that anyone could make on the spur of the moment?—Yes.

5918. And until you submit to the Commission official figures worked out from tables, these of course should not be taken as reliable figures?—I agree.

5919. I wonder if when you mentioned those figures you meant profits or dividends paid?—Net profits.

5920. Which means that you paid less dividend than 10 or 125 or 75 per cent. as the case may be?—Some mills might have paid more dividend than these.

5921. Could you make an equally good guess with regard to dividends? Out of these percentages you have got to allow for deductions for depreciation, reserve fund, &c. That would present quite a different picture, Mr. Patel?—That is the whole average of all the mills.

5922. These are the net profits made by the mills after deducting all charges?—Yes.

5923. If depreciation and reserve fund were to be deducted from these the dividends would be considerably smaller than 10 per cent. or 125 per cent. or 75 per cent.?—As stated above, these are net profits.

5924. Would you mind telling us when the first mill was started in Ahmedabad, if you remember it?—Somewhere about 1885.

5925. Which means about 40 years back. You have given us figures of profits from 1900. Can you give us an equally good guess about the earnings between 1885 and 1900?—I cannot say.

5926. When you send those figures which you promised to the Chairman, would you include these figures also?—I do not think I have got any data to work out those figures; we have not got such records.

5927. Can you tell us, Mr. Patel, how many mills in Ahmedabad have gone into liquidation during the last three or four years or are on the auctioneer's anvil for sale?—About six.

5928. What was the reason of that? You gave the figure of profits of mills in Ahmedabad between 1920 and 1924 as 75 per cent. I think you are rather underestimating the number of mills in distress; I myself know 10, but that does not matter; let us take it at six?—If we take mills situated outside Ahmedabad the figure would be 10.

5929. They were all controlled by mill owners in Ahmedabad?—Yes. Not to-day.

5930. What was the reason of these 10 mills going into liquidation when the other mills were getting an average profit of 75 per cent.?—It was, in my opinion, mismanagement and speculation.

5931. From the very interesting narrative you gave us about how mills are floated in Ahmedabad, would it be a correct description to say that in Ahmedabad it has been customary to start cotton mills under-capitalised?—Yes.

5932. You start a mill and the agents identify themselves with the mills to such an extent that they stake all their credit and all their means in building up the mills, and employ fewer engineers and managers than we do in Bombay or in fact than is done anywhere else in India?—That is a fact.

5933. And that your management is so economical that you earn the encomium (I do not say that in any bad sense) that you are yourselves the worst sweated labourers in the mills, that you work there from morning till night; that is how you have built up this industry in Ahmedabad?—Yes.

5934. And there is no parallel to it in any other part of India?—That is a fact.

5935. That is a factor, therefore, that has to be borne in mind when one considers your figures of profits?—Yes.

5936. I shall therefore now restrict my questions to another aspect of the currency problem as you have told us that you have no expert opinion about exchange operations yourself, nor does your committee command any expert opinion. Ahmedabad has a fairly biggish bullion market, has it not, in Guzerat?—Yes.

5937. And it is the most important centre for that purpose?—Yes.

5938. With that at your very door, you have told us under question VI, "The people have learnt during the war and after that the rupee is very unstable in value and they have known long since that it is a token coin." And you end that paragraph with this sentence "It is no fault of the people of India if they are led to this practice, because they cannot have any confidence in the unstable token rupee." What have you based

this on; on your observation or on conversation? What is it that has led you to make this statement?—Observation and experience.

5939. Will you describe your experience and tell us how you came across it?—In my experience, and so far as I gathered information and opinion from other sources, the people were mad after gold to hoard it up and buy it at any price at certain periods, and they had no confidence in this token coin.

5940. What is the reason for their confidence being shaken?—Because they thought gold was the best security which could be converted at any time they require.

5941. You mean it had full value?—Yes.

5942. Whereas when the rupee was melted down it was not worth its full weight?—Only about 8 or 10 annas.

5943. Do you think the masses realise that?—I think they do, and that is why they go with rupees and purchase gold. Secondly, in my own experience certain people from the villages came and gave me their hoarded gold coins to hold on their behalf; and I advised them to cash the coins and put the money in circulation.

5944. In the Ahmedabad mills as deposit?—In the mills as deposit or in banks.

5945. What was their reply?—In some cases they did so to the extent of half the coins; in some cases they refused to do it at all; and I know of some people who have gold coins hoarded up for the last six or seven years.

5946. What is that mentality due to?—It is due to want of confidence in the rupee coin; they think that gold is always a thing of full value to them.

5947. That is the observation of your committee from day to day, and you have included that in your statement that you made here and which I just now read?—Yes.

5948. Now, regarding the question of currency notes *versus* coin, do you think the increase of currency notes in circulation is still going on, or do you think it has got a set-back?—I think it is at present to the extent of 190 crores, and it has not got beyond that.

5949. I know the total notes in circulation. But do you think that, when crops are being marketed at season time, the cultivator accepts currency notes more willingly now than he used to 10 years back?—Yes, he is accepting it more willingly now.

5950. What is the denomination of the currency note which your cultivator in Ahmedabad accepts?—Five or 10 rupees mostly.

5951. The smaller denominations. Why do they not accept the higher denominations, Mr. Patel; can you tell me?—Because when they go to their village they cannot get cash against hundred rupee notes; they would have to pay discount there.

5952. Now, do you think that, when a gold standard with a gold currency has been in operation for, say, a year or 18 months and the first novelty is gone, people will equally readily accept currency notes, or do you think they will want the gold coin?—I think they will want the gold coins for a number of years. If confidence is established within a shorter period, in that case they will accept notes.

5953. Take a year or two. When they have seen for a year or two that they can get the gold coin whenever they want it, would they accept the currency notes equally readily as at present, or do you think they will insist on having the gold coin?—I think they will take notes as readily as they do to-day, but I think in future they will take gold coin in a lesser quantity.

5954. That means their confidence in the notes will be strengthened?—Yes, their confidence will be increased.

5955. But one necessary corollary to this, in your view, is that they must be able to get the gold coin at the start fairly freely?—Yes, certainly.

5956. Now, regarding the question of hoarding, Mr. Patel, are you intimate with this system of hoarding on a large scale in Ahmedabad, or round about Ahmedabad?—No, I am not in close connection with it.

5957. But you did tell us just now that somebody came to you and asked you to hoard some sovereigns. Do you think this hoarding is scattered among many people or only among a few rich people?—I think it is more in the villages than among rich people.

5958. More in the villages than in the cities?—Yes.

5959. Now, regarding this hoarding, do you think much silver rupee is hoarded?—No, I think gold is preferred.

5960. That is, you think that, whatever silver rupees were hoarded have been changed for gold by now?—I think so to a great extent.

5961. You named the figure of 100 crores of rupees worth of gold which would be required before gold currency could be put into operation?—Yes.

5962. May I ask you if that figure was given to you by your Association or whether it is a figure which you have given yourself?—No, on reading certain books and literature on the subject that idea has come into my mind.

5963. Yours personally? I mean your Association has not discussed this question?—No.

5964. Nor did they give you any particular figure?—No. That is not mentioned in my statement anywhere.

5965. But as you said you were giving evidence on their behalf, I wanted to make sure whether this figure which you give was mentioned in the deliberations of your committee. I understand now it is only your personal figure?—Yes, obtained from books only.

5966. Now, I want to ask you one question, if I may, in connection with what you said about the raw cotton rates prevailing in India. The total crop of India, you would take at what—60 lakhs of bales?—70 lakhs of bales.

5967. Very well. Out of a total crop of 70 lakhs of bales, how much do you think the mills in India use?—22 lakhs of bales.

5968. Then there is the non-factory consumption, which you would like to take at how many lakhs—for charka, hand spinning, and so on?—Say about five lakhs.

5969. I think that is too low; take it at 15 lakhs. That makes 37 lakhs?—Yes.

5970. That leaves 33 lakhs of bales, Mr. Patel, for export?—Yes.

5971. Now, you, I understand, are a mill-owner yourself. Do you buy in any important cotton growing centres?—Yes.

5972. What sort of rate, Mr. Patel, does your agent pay for the cultivators' cotton? He pays a rate in competition with foreign exporter buyers, Japanese and European?—Certainly.

5973. Therefore, if a rate of exchange is fixed the foreign exporter need pay fewer rupees for cotton here, you the local mill-owners also pay fewer rupees?—Yes.

5974. Therefore, you get your cotton cheaper to that extent, Mr. Patel?—To the extent of transport charges.

5975. Excuse me. Which is the market rate at which you buy? Name any market where you buy?—Lyallpur.

5976. Very well, you buy your cotton in competition with the Japanese and continental exporter. The cultivator keeps back the cotton which he wants to keep for his own spinning, &c. Well, you are three competitors. Indian mills, Japanese and continental buyers. The exportable quantity you have yourself given as 33 lakhs of bales. I will take it roughly as half of the total crop. If the crop is 20 thousand bales, 10 thousand bales may be purchased by you. You will buy only in competition with the foreigner. If he must pay 12½ per cent. less for the produce owing to the higher exchange, you will also buy at that lower rate?—Certainly.

5977. Therefore, you agree with Sir Henry Strakosch that, as far as your 60 or 50 per cent. cost of raw cotton in the mill is concerned, you do make a saving?—Yes, certainly.

5978. (*Chairman.*) Sir Purshotamdas, the witness did not agree with Sir Henry Strakosch.

5979. (*Sir Purshotamdas Thakurdas.*) I therefore particularly wanted to follow up the argument, Sir.

5980. (*Chairman.*) Yes, but you see my difficulty, Sir Purshotamdas. The witness formally disagreed with that proposition when it was put by Sir Henry Strakosch. Now I understand he agrees with it?—Yes, at the end of the argument and after practical discussion, we have to agree. Because I didn't understand the question from the view point in which it has been explained to me now.

5981. (*Sir Purshotamdas Thakurdas.*) You do make that statement now?—Yes.

5982. Now, in your mills you use imported stores? The expense of that, Mr. Patel,—to name a figure which has been given to us by a prominent mill-owner—is about 7 per cent. of the total cost of your production. You make a saving in that also owing to the higher exchange, because you use imported stores. There is your 60 per cent. of cotton, on which you save 12½ per cent. There is your 7 per cent. of imported stores, on which you save 12½ per cent?—But we have to pay a 15 per cent. duty on that.

5983. That you pay whether it is 1s. 4d. or 1s. 6d. That is a common factor. The question is why do the mill-owners contend that the higher exchange is detrimental to the mill industry? You make a saving of 12½ per cent. on 67 per cent. of your cost of production. Why do you complain?—Because we don't get a sufficient price in the market when we go to sell our products, and therefore we are being affected by foreign imports.

5984. Manufactured articles? Now, it has been pointed out that the lower rupee rate by 12½ per cent. which you in common with Japan and continental buyers in India pay to the cotton cultivator reduces the buying capacity of the cultivator who is your best customer?—But it will reduce the prices also.

5985. The lower rate reduces the buying capacity of the cultivator, who is a valued customer of local mill cloth?—But he will get a better price for his exported article at the same time.

5986. We are now thinking of 1s. 6d. At 1s. 6d. you in common with Japan and continental buyers in India buy the cotton for 12½ per cent. less. Therefore the ryot has lesser rupees with which to buy your piece goods, he is your best customer. You spin and weave for the Indian cultivator—coarse count—and they may be at the back of the minds of your committee when they say that the mill-owners feel that for the cotton industry a lower rate is preferable to a higher rate of exchange?—Yes.

5987. A question was asked whether you would compare your demand for 1s. 4d. in preference to 1s. 6d. with the desire on the part of France to go higher from the low point which her exchange has reached. Do you think there is any parallel between the two cases? You have only asked for 1s. 4d. as restoration at the pre-war ratio. You are not asking for a lower ratio. There would be something to say for that parallel if you asked to go under 1s. 4d.?—Yes.

5988. Now, regarding the Imperial Bank, Mr. Patel, will you turn to the last paragraph but two of your written statement, just above Question 9. You say: "it should be made one of the conditions of the transfer that the Imperial Bank should issue such seasonal currency under certain conditions." What are the conditions?—Whenever the bank rate rises say it goes to 6 per cent., say five crores.

5989. But that is in existence to-day.—Yes, and then again when it goes to 7 per cent. a further limit may be given.

5990. That is in operation to-day.—Then further powers may be given to the Governor General in Council to issue emergency currency by an ordinance which may be withdrawn as soon as the crisis is over.

5991. You mean in times of crisis only? For a normal season and normal years you think a 12 crore limit is enough for your purposes? You are thinking of something very abnormal which may come up. But supposing we ask for your views regarding a year to year thing, then you don't suggest any change?—No, I don't think so.

5992. (*Chairman.*) Perhaps you will ask him, Sir Purshotamdas, what was the significance when he suggested an addition of seven crores.

5993. (*Sir Purshotamdas Thakurdas.*) You named 7 crores in reply to the chairman as an emergency?—That the power be given to the Governor General in Council to issue by an ordinance to the extent of 7 crores in times of crisis.

5994. What sort of crisis had you in your mind at that time?—Certain bank failures or some such definite crises in which people lose faith immediately. There are sometimes raids on banks. So, if there are five or ten or fifteen raids at such times of crisis, more currency will be required for the time being and in that case the ordinance will be useful.

5995. Mr. Patel, you tell us that you have been in business for fifteen years. Have you anything particular in view which happened in the course of the 15 years which makes you suggest this?—Well, last year in 1924 the bank rate went very high and at that time it was with great difficulty that the whole period was tided over.

5996. Yes, Mr. Patel, but that was not a crisis of the nature that you name. There was no run on banks?—That was in 1913, the run on banks.

5997. Oh, when the Indian Specie Bank failed. That is what you have in mind? I don't think there was any other bank that was in trouble, bar the Specie Bank which broke?—I believe India is a country in which sometimes a simple rumour creates trouble and people flock to their buyers and creditors to demand their money. So in this case of special emergency there may be a fear.

5998. But under the Government of India Act, the Viceroy is invested with the power to issue an ordinance any time he likes. So will that serve your purpose?—Yes.

5999. Now I want to ask you regarding this emergency currency of 12 crores: that as at present under the law can only be issued against genuine trade bills?—Yes.

6000. Do you think that trade bills worth 12 crores of rupees are ordinarily available to the Imperial Bank? I am asking you if you happen to know whether they are available or not? Will you take it from me that it is difficult to get those trade bills? In that case what would you recommend?—In that case there will be sight Hundis, 30 days, 60 days, 90 days.

6001. Well they are included in the trade bills; and even with those included, the amount cannot be put up to 12 crores by the Imperial Bank? If that was so, what would you suggest? Let me suggest to you one thing which has been suggested elsewhere by others. It has been suggested that the cash credits which are given to cotton mills should be converted into trade bills at such a juncture? Are you in any way familiar with the credits given by the Imperial Bank to mills?—I know of some instances.

6002. Do you think that in each one of these cases the mill which gets the cash credit from the Imperial Bank has got liquid assets behind it? Or do you know of any case where the Imperial Bank has given cash credits for the purpose of financing the capital debt of the mills?—I do not think they have given any cash credits for the financing of capital debts.

6003. Have you heard the complaint that the Imperial Bank has been very strict and would not

countenance any such request?—I think nobody has had the courage to put such a request because they are too hard for that. That is the reputation of the Imperial Bank.

6004. And therefore each one of these cash credits, Mr. Patel, is for all practical purposes a trade bill, backed by produce in course of manufacture or by manufactured articles?—Yes.

6005. And for all practical purposes you as a practical business man would say that there is nothing wrong in looking upon these cash credits as trade bills for the time being?—Yes.

6006. Have you heard anything regarding the Imperial Bank being ready to advance wherever such liquid assets have been available?—On the contrary I have heard that they are very loth to assist mills and factories.

6007. As a general statement, you make that statement?—Yes.

6008. You say that from personal knowledge?—Yes.

6009. You know the amount the Imperial Bank has lent in the last three years as compared with the previous period?—I do not know exactly.

6010. (*Sir Purshotamdas Thakurdas.*) I suggest to you that you revise that statement.

6011. (*Sir Reginald Mant.*) Mr. Patel, you said in reply to Sir Purshotamdas Thakurdas that with a higher rate of exchange the cultivator will get a smaller price for his cotton crop and will only be able to pay a smaller price for his cloth, and consequently the mills will suffer. Do you suggest that that would be a permanent consequence of the higher rate of exchange, or that that would only prevail during the period of adjustment until prices have been stabilized at the higher rate?—Would you kindly repeat your question?

6012. Do you suggest that the disadvantage to the mills will be a permanent result of the higher rate of exchange, or will only provail during the period that prices are adjusting themselves to the higher level?—If the rate of exchango remains high, then the effect will be permanent.

6013. Do you suggest that prices will never adjust themselves to the higher rate?—No, if the exchange remains the same, then it would be difficult.

6014. I think you accepted the position just now that a lower rate of exchange raises prices and a higher rate of exchange lowers them. After that adjustment has taken place, when prices have become modified in accordance with the new rate, the lesser number of rupees that the cultivator gets for his cotton will have a larger purchasing power?—Yes, but that can cut both ways.

6015. And his buying power will then recover?—It depends upon the surplus that remains with him. If the agriculturist has got sufficient to make both ends meet, in that case he will have no surplus, but if the amount which he gets leaves some surplus with him, then it will have different effects.

6016. Let us put it in this way. Supposing an agriculturist receives, with exchange at 1s. 4d., Rs. 45 for a certain amount of cotton. You raise exchange to 1s. 6d. He will then only get Rs. 40. The question I ask you is whether when prices have become adjusted all round, will not those Rs. 40 purchase just as much cloth or other commodities as the Rs. 45 which he got at the previous rate of exchange?—But those Rs. 40 which he obtained in that transaction will be remaining with him till that period, he will have to spend his Rs. 40 that he got for the first transaction, within two or three months.

6017. We are talking of the time when prices have become stabilized at the new rate. Let us assume that he then receives Rs. 40. Will not those Rs. 40 then have just as great a purchasing power as the Rs. 45 had before?—I think theoretically that is correct.

6018. (*Chairman.*) I think with reference to these questions we must remind ourselves that the questions we ask Mr. Patel have reference to his immediate practical experience.

6019. (*Sir Purshotamdas Thakurdas.*) One question, Sir, regarding the Ahmedabad mills. Mr. Patel, since 1923 you made a roduction in the wages of your mill-hands in Ahmedabad?—Since 1923.

6020. Was there any strike?—A very long strike of seven weeks.

6021. Do you think that if you made any further effort to reduce wages in Ahmedabad, there may be another long strike?—Certainly.

6022. To that extent, as far as the cotton industry is concerned, do you think that the adjustment that is necessary owing to the rise in exchange from 1s. 4d. to 1s. 6d. is complete?—No.

6023. How long do you think it would take before you get your wages down in Ahmedabad to complete the adjustment?—I think it will take two years more, and that too with a very strenuous effort. We have got there a very organized labour union, and they can put up a very bitter fight with us.

6024. You would then say that at the moment the adjustment necessary in the industry owing to the rise in exchange from 1s. 4d. to 1s. 6d. is not complete, and you are passing through a period of maladjustment still?—Yes.

6025. (*Sir Henry Strakosch.*) I have one supplementary question to ask. You mentioned that the Imperial Bank was very hard on the cotton mill industry because they are not willing to advance money for capital purposes. You think it is the business of a Bank to advance money for long term capital purposes?—I think, if the security is sufficient, they ought to advance.

6026. Even though the bulk of the liabilities of the Bank are withdrawable at short notice?—No, in that case I think one year's notice ought to be given.

6027. But then it is the business of a Bank to take money on deposit, and the bulk of the money taken on deposit is immediately withdrawable?—Yes.

6028. Therefore would you consider it the business of a Bank, a soundly-run Bank, to lend that money on long term?—They may fix certain limits,—that to the extent of so many rupees they may do this business so far as it is safe with them. Suppose they have to invest 100 crores. They may divide it into different classes, say 50 crores for industrial purposes, 10 crores for any other kind of loans, 10 crores for separate kinds of loans; and then they may decide that to certain mills or to certain other persons who are well secured loans may be advanced in this fashion. The selection may be with them.

6029. But would you kindly explain what the Bank would do if the depositors of short-term deposits all came along and wanted to withdraw those deposits, —having allocated their deposits in the fashion you suggest—what would the Bank do?—The allocation would be a comparatively small proportion of their total deposits. Only a very small proportion.

6029A. But would you regard it as the proper business of a Bank to borrow short and lend long?—Certainly not. But if they get surpluses to the extent of 20 or 30 crores to be invested, then in that case these kinds of loans might be advanced.

6030. But where do these surpluses come from?—They come from investment; supposing they have long trusts in addition to their annual deposits—then there may be certain other kinds of accounts, running accounts for a long number of years.

6031. That is to say, you would suggest that the Bank should only lend long if it gets long-term doposits?—Yes, or if they have got such funds or such reserves which are not like temporary deposits.

6032. So that it would be correct to say that you would advise the Bank to lend long-term only to the extent to which the Bank has received long-term deposits, plus their reserves, plus their capital?—Yes.

6033. Well, therefore, I suppose as it is not the ordinary run of the Bank's business to receive long-term deposits, that kind of business must obviously be very small?—I believe there are other kinds of secret reserves with Banks, other kinds of trust

reserves, and in that case they can safely tap those resources.

6034. Do you think that would be a proper way of employing their resources? The reserves are there to meet an emergency?—It is therefore that I fix a certain percentage; not the whole. Of the 100 crores say 50 crores could be loaned in long-term loans.

6035. You would prefer to deposit your money with a Bank that is very careful in lending money than with a Bank that is prepared to lend long for capital purposes?—But sometimes a too over-cautious Bank does not get business and the profits are less.

6036. (*Sir Henry Strakosch.*) We are not speaking of profits; we are speaking of security; the security is always greater with a Bank that is more cautious.

6037. (*Sir Alexander Murray.*) In connection with the statement which it has been suggested that Mr. Patel's Association might prepare, I suggest if possible that statement should show not only the ordinary capital but the preference capital, the debenture and other loan capital, reserves and other funds; I make the suggestion for the reason that I appreciate Mr. Patel's point that profits are actually earned on the total amount of money invested, although comparatively large dividends may have been paid on the ordinary capital only; and in that connection it would be well to know which mills were erected in pre-war years, which during the war and which subsequent to the war?—But I have in my possession balance-sheets of one or two years only, and I may simply submit copies of these balance-sheets. It will be very difficult for me to prepare a statement out of these.

6038. (*Sir Henry Strakosch.*) Could you supply us balance-sheets from 1919 onwards?—I have got figures only for two years, 1923 and 1924.

6039. But could you not apply to the Company for copies for those years, because it would be an interesting study?—Could you not obtain them from the Registrar of Companies? All the balance-sheets are filed there. If you ask in the office of the Registrar of Companies, you will get them.

6040. (*Sir Maneckji Dadabhoy.*) Sir Victor Sassoon told us the other day that he had copies of statement of profits for the last 20 years.

6041. (*Chairman.*) That is for the Bombay mills. I do not know whether he agreed to supply them. An application is being made to the Bombay Mill Owners' Association for such information.

6042. (*Sir Maneckji Dadabhoy.*) But the Ahmedabad statistics will not be of much use for us unless we get them for a very long period. Sir Henry Strakosch wants only from 1919, and I think that if we are to obtain them, we must get for a period of 25 years.

6043. (*Chairman.*) We must get what we can. I understand from Mr. Patel that he is not able to supply us with information for more than two years?—Yes; I have got it only for 1923 and 1924, and I can submit the balance-sheets which are in my file.

6044. (*Sir Maneckji Dadabhoy.*) That is no good.

6045. (*Chairman.*) We must discuss whether it is worth while making an application under those conditions?—Am I to send those balance-sheets?

6046. (*Chairman.*) Not until a communication is made. We are much obliged to you for your very full assistance to-day.

(*The witness withdrew.*)

Dr. B. R. AMBEDKAR, Barrister-at-Law, called and examined.

6047. (*Chairman.*) Dr. Ambedkar, you are a barrister-at-law, and you have been kind enough to furnish the Commission with a memorandum* in which your recommendations as regards the Indian currency system are set forth in detail. I think you have also been nominated as one of the representatives of the Institute of Social and Political Science?—Yes.

6048. Whose opinions have been set forth in another memorandum?—Yes, that is so.

6049. I understand that you are a close student of these questions?—I was 2 years before, but since I have been practising of course I have not been able to give sufficient attention to the very recent developments in currency and so probably my facts and figures might sometimes be rather out of date, but I should be able to tackle any point from the theoretical side of the subject, I presume.

6050. You have been a student of political science?—I was a Professor at the Sydenham College of Science for two years and I have written a book on the Problem of the Rupee.

6051. I should like to ask you a few questions to elucidate a few individual contributions which you make to the subject in the course of your memorandum. In sub-paragraph (i) of paragraph 2 you commence with he statement: "A pure gold standard is stable because the value of gold in circulation is so large", and so on. What are you referring to as "a pure gold standard" in that connection?—A pure gold standard means a gold currency as the standard of value.

6052. A currency consisting of gold?—Largely.

6053. Supplemented by some form of token currency?—By some form of token currency, yes.

6054. In so far as your opinion is based upon experience, can you refer to any instance in which a country has had a gold standard system with a large proportion of the circulation consisting of gold coins?—I may refer for instance to a country like Germany, and barring for instance the deposit of currency in England I should also cite the case of England.

6055. In both those cases we must recognise that the actual proportion of the circulating medium which consisted of gold was comparatively small?—May I say just one thing? What I want to emphasise there is that the new additions to the supply are so small in comparison with the existing volume in circulation that the new supply does not make much difference to the price level. That is what I really want to say there in that paragraph; but when you have a currency which is merely regulated by the will of the issuer, the issuer may add a new supply to the existing stock of such an amount that he may disturb the price level once established.

6056. The new conditions there referred to are, I take it, the increment of currency rendered necessary by the regular expansion?—No; I simply say productions of the mines when I talk of new additions to the gold supply.

6057. Then you are dwelling there upon the feature that the annual additions to the quantity of gold in the world are so small?—That it does not cause any upheaval in the price level to any appreciable extent.

6058. In what respect does that serve to distinguish between any form of currency where the internal unit is related in stability to gold?—I do not quite follow.

6059. In what respect does the circumstance as to the small proportionate annual addition to the world's gold supply to which you refer serve to distinguish, as regards this matter of stability, between a currency based upon gold in circulation, and a currency based upon the gold exchange standard? That is the second part of your paragraph?—There I say that when you start with a certain given price level and if your issue of new currency is entirely dependent upon the will of the issuer, then he may add such a volume of currency to the existing stock that he may disturb the price level materially. There is nothing to prevent him from doing that. May I give, for instance, an illustration: suppose a government was a bankrupt government and it wanted to finance certain of its departments, then it can very easily

* Appendix No. 29.

issue, for instance, a token currency of any sort and add to the existing volume of currency as almost all the belligerent countries have done.

6060. Now let us assume a country with a currency of a certain amount of gold in circulation, supplemented by notes in circulation; that is one proposal, I understand, in regard to the point to which you are leading up?—Yes, in a certain way.

6061. And, on the other hand, a currency based upon a gold exchange standard. Will you expand your recommendation by helping the Commission on this point: why this possibility of what is really inflation is more impossible when you have gold in circulation than when you have a pure exchange standard?—It is this: the fact that you have the liability of converting your paper currency into gold under a gold currency with paper in circulation is a means whereby the paper currency is kept within limits. You cannot add more paper currency to your circulation than what your reserves for convertibility would permit. But where under the gold exchange standard, as we have had in India, there is no liability upon you to convert your circulating media into gold you are free to issue as much as you like.

6062. Supposing (I start with a supposition) that you were to accept an obligation to convert your internal currency under an exchange standard into gold or the equivalent of gold in a foreign currency, would that, in your opinion, put the two systems in the same position as regards their capacity for resisting inflation?—It depends upon what kind of convertibility you adopt.

6063. I am supposing the acceptance by the currency authority, whatever it was, of a legal obligation to convert the internal currency on presentation into gold or the means of obtaining gold in a foreign currency in a gold standard country?—If your obligation is to accept to pay gold on tender without question then I think that would be sufficient. If I may say so, I mean that convertibility is like conscience and it might be of various degrees; and its efficacy to control the volume of currency would depend upon what kind of convertibility you have. If your convertibility is only for the purpose of foreign exchange then my submission is that that would not be a sufficient limitation on the issue of currency.

6064. If the obligation is such as that to which you have just referred, an obligation to convert the internal currency into a means of international payment, either gold or foreign currencies based on gold, why, in your opinion is that not an adequate means of preventing this danger of the inflation of currency with which we are dealing?—Because a foreign exchange is not necessarily an indication of internal inflation. For instance, in our own experience in India it has been found out, and it has been found out I think by Professor Keynes, that although the rupee remained at the ratio of 1s. 4d. for a long time, the level of prices in India and the level of prices in England were very different. Exchange cannot be said to be in complete harmony with the whole of the price level of a country. Exchange affects only such things as enter into international trade, and everything would really depend upon what is the volume and what is the ratio of the goods that enter into international trade and goods that did not enter. If the country is so situated that its internal trade is much larger than its external trade, in fact, if its external trade is insignificant. . . .

6065. What do you mean by the internal trade being larger than its external trade?—I mean that all the goods or all the transactions of a country are not meant for the purpose of foreign trade. In fact a country may have very little foreign trade and consequently the valuation of goods that do enter into foreign trade may not affect the valuation of goods that do not enter; the relations between them may not be very close.

6066. Let me generalise the question somewhat and put it in this way: whether you have a gold standard with notes and gold in circulation, or whether you have an exchange standard by which the internal currency is converted into external, is not the volume of internal currency in both cases controlled by the preservation of a certain ratio between the reserves and the internal token currency outstanding, and is it any easier to ensure the maintenance of that due relation in the one case than in the other?—I have been thinking more of prices rather than of exchange ratios. I quite admit that the exchange ratio between two currencies might remain the same and yet the internal price levels in the two countries may differ.

6067. Which two countries?—Any two countries; take for instance England and India; the ratio between gold and the rupee or sterling and the rupee taking the sterling as equivalent to gold, may remain the same; in fact it did remain the same for a long time; but taking into consideration the price level in the two countries, they did differ; although I admit that after some time the internal price level will assert itself and bring the foreign exchange ratio in line with itself.

6068. I think you are going a little in advance of the actual point with which I was dealing in my question, although no doubt you are referring to matters which are very relevant. Now let me put it from another point of view. As a matter of fact, if we consider countries in which there has been a currency system more approximate to that which you recommend than India has ever seen, have those countries under the stress of necessity ever felt the slightest difficulty in inflating when they felt the need to do so? Let me instance what occurred in gold standard countries in the war?—No; as I say, gold itself may be subject to inflation. It was as we found in America itself, subjected to inflation on account of the enormous quantity of gold in circulation then. Might I put it in this way? That convertibility for the purposes of foreign exchange is insufficient; that is the point I am driving at. Convertibility, if it is to be an effective convertibility, must be convertibility without question; it must be convertibility for all purposes, although if I may just say so I am not in favour of a convertible currency, as you will see from my memorandum.

6069. Possibly a certain confusion may be introduced by the analysis of convertibility into internal and external convertibility. What is essential, is it not, in a sound system of currency, now that gold is to be once more apparently accepted as the world's international payment, is that the unit of internal currency should be stably related to a definite gold value?—I do not quite accept that; it may be stable for international purposes; it might not be stable for internal purposes.

6070. I do not think I managed to make my question quite clear. I understand what is desired by you in your recommendations is that the unit of currency which is used internally should be stably related to a gold value?—I am really more for the use of gold. I am opposed to any kind of system which will economise gold under the present circumstances. Because I think that economy of gold is incompatible with security of price. My standpoint is very different from the standpoint of other people. I may be a little barbarous in my view.

6071. Not at all. Let us examine what your real idea is. What is your ideal to be attained in the organisation of the currency of a country? It is not that the internal unit should be stable in relation to gold?—Oh yes, it should be stable—not in relation to gold but stable in terms of commodities.

6072. By what methods do you recommend that India's internal currency should be stabilised, that is, in relation to what, and, secondly, by what methods?—It should be stabilised more in relation to commodities rather than to gold, which is used only for purposes of internal trade. And I say it should be done by stopping the coinage of rupees altogether, and prescribing the use of gold.

6073. If we reject gold as a standard of reference for the internal currency, what other standard of

reference are we to adopt?—That I have given here. That we should either go to the Compensating Standard of Professor Fisher or to the Tabular Standard of Professor Jevons. If you do not want to use gold and economise gold, then my submission is that you should go to one or other of those two.

6074. I am not sure that I am very intimately acquainted with Professor Fisher's standard, but are these both the same sort of proposals?—They are very much the same except that Professor Fisher's Compensating Standard—they are really what I should say, I mean, the two sides of the same medal, so to say. Professor Fisher would, for instance, alter the metal in the gold unit according to a certain index number, and Professor Jevons would allow more units to be given or less units to be given according to a certain index number. But I think those two are too complicated. I personally believe that a gold standard for all practical purposes is sufficient.

6075. Returning to what is practically possible, you are of opinion that the value of India's currency unit should be determined in reference to a certain quantity of gold?—No, my submission is that India should have gold in currency. Gold should not only act as a unit of reference.

6076. Let me pass from that and ask you another question. Let me now deal with the view which you advance, which I understand is best expressed in paragraph 4 of your memorandum, sub-paragraph (2), where you say: "The whole world is suffering from a continuous rise of prices owing to the depreciation of gold. Anything, therefore, that will tend to appreciate gold will be to the good; and if gold is to appreciate there must be a larger use of gold as currency." If I understand the precise force of that opinion, it is that the gold exchange standard tends to economise the use of gold, and that what is prudent and advisable is not that the use of gold should be economised and therefore that the gold exchange standard is bad?—Yes.

6077. And that is based upon the view which you take as to the future relation between the demand and the supply of gold in the world?—Yes.

6078. You are of opinion that the future supply of gold is likely to grow in relation to the demand?—No not grow; it will remain large because other people are not using gold, they are using paper, they are not in a position to use gold, so gold, even if it is not used, will remain large in quantity.

6079. First of all, a preliminary question in regard to that. Are you considering here the interests of India, or are you considering the service which India might render to the rest of the world?—I have both in view.

6080. You think that, by doing that, India will be serving her own interests and the interests of the rest of the world at the same time. Do you agree with the not uncommonly held opinion that a gold currency is an expensive system?—Yes, it is.

6081. So that we have to consider, in the first place, the possible disadvantage to India of the expense involved. What are the advantages to India to set against that expense?—It is that you get a more stable standard, which as Professor Cannan says is knave-proof and fool-proof.

6082. Now, as regards the prospect. The force of this contention would depend, would it not, upon the realisation of your anticipations as regards the supply of gold in the world at large?—Yes.

6083. Would you agree that, supposing on the other hand there was to be a relative decrease in the world's gold supply such as might tend to a general rise in world prices, that then it would be to the advantage of India, as of other countries, to economise in the use of gold?—Well, my reply is that we need not be afraid of an indefinite contraction. We have always got methods for increasing currency. We must guard against indefinite expansion which is always possible.

6084. If you have pegged the Indian currency definitely to gold through the gold standard and there is a relative diminution in the world's gold supplies, then any general fall in prices which must result would make itself felt in India also?—Yes, but that could be guarded against by increasing our paper currency or otherwise by manipulating the paper currency.

6085. Is not that sacrifice very characteristic of the gold currency system, for which you yourself have selected that system?—No, I am making gold the currency simply because I want to avoid the possibilities of indefinite expansion. As I say, you can always guard against an indefinite contraction. Falling prices can always be prevented.

6086. Now let me ask you a question as to the opinion you have formed that anything that would tend to appreciate gold would be to the good. Have you been able to arrive at any statistical estimates as to what the future of the relation between the supply and the demand of gold will be in the course of years to come?—Well, in my investigations I did some of them in 1923, when I was writing the book. I had occasion to read some articles which appeared in the Harvard Business Barometer Series and I rather got the impression that there was no likelihood of any fall in the production of gold. And besides, my point is this, that the countries of the world are using so much paper that whatever gold supply we have is really very large. Those countries therefore that can avoid economising gold might as well do it to their own benefit and to the benefit of the rest of the world.

6087. I am not quite sure that I follow the latter part of your reply?—What I say is that although the production of gold may not be increased physically from the mines, yet the use of substitutes for gold in modern days is on such a vast scale that the quantity of gold in the present circulation might appear to be large enough for a long period for the transactions of the world even without new additions from the mines.

6088. You have no more statistical calculations which you would care to put before the Commission as to your estimate of the future supply of gold?—No, I have made no estimates.

6089. This is a matter, of course, which is of great importance for the consideration of the Commission, so let me put to you one or two estimates that I have been supplied with from other sources. These are estimates as to the effect upon general gold prices of the movement of the relation between the demand for gold and the supply of gold for a period of years. They are forecasts made at various dates by authorities, and they are referred to the year 1930. What is done is to measure the effect of the gold supply upon prices by trying to forecast the general level of prices in 1930 by reference to 1913 as the 100 standard, and thus to see what the future of the world in this regard is. I have here an estimate of Sir James Wilson, made in 1921, who estimates that the result of these factors will be that the general price level in 1930 will be stable at 115. That is a substantial fall, you see from the present figure which is round about 158. Then there is that estimate to which you have already referred, the Harvard Business Barometer, in 1922, which estimates that in 1930 the general price level should stand about 150, and should be stable at that figure. Then there is Professor Gregory, who makes an estimate in the near past, May, 1925, who estimates that the general price level will stand about 162 in 1930 and should be rising at that figure. So he is the one who is most of your opinion. And, finally, there is Mr. Joseph Kitchen, an eminent authority, who in July, 1925, made a forecast that in 1930 the general price level should be expressed by a figure of 120 and should be falling at that figure. Of these four attempts to forecast the position, three anticipate that the prices will have fallen at that time; two believe that they will be stable at that lower level; one, Mr. Kitchen, be-

lieves that they will be falling at that lower level, and only one believes that they will be higher than they are now and rising. I will put it in this way. In view of these very careful attempts to estimate the situation does it not teach us the necessity of exercising great caution in making the assumption that it is unnecessary, in order to maintain prices stable, to economise the use of gold?—I am rather in favour of falling prices rather than rising prices, and I am glad if they do fall and fall rapidly too. I think it is good for the nation that there should be a fall in prices rather than a rise in prices. So these estimates do not really deter me from making my proposal.

6090. Nevertheless, there is some different basis for your opinion?—I take those opinions for what they are worth. I am not in a position to contradict them because I have never made any estimates. But somehow this is my belief that already the existing amount of gold is so large and the capacity of the countries of the world to use that currency, any currency, is so small that the supply of gold is likely to remain larger for a long period, and there is, in my opinion, not much chance of prices falling.

6091. Then there is a further question. I should preface it by saying that you are dealing here with the abolition of the exchange standard?—Yes.

6092. In paragraph 5 you say, "The gold standard reserve is peculiar in one respect, namely, this: the assets, *i.e.*, the reserve and the liabilities, *i.e.*, the rupees are dangerously correlated by reason of the fact that the reserve cannot increase without an increase in the rupee currency." I am going to ask you to expand that a little, and in order to show you what I think needs expansion, I would put these possible questions by a critic. Might not a critic say: you say that the reserve cannot increase without an increase in the rupee currency, and this critic might say, why should it? He would say, if the rupee currency cannot increase without an increase in the reserve, would that not be a most desirable state of affairs? Have you followed my point?—I will explain in this way: for instance, there are the bank issues and the reserves of a bank. If you compare, for instance, the bank reserves with the bank issues and the currency and the gold standard reserves of the Government of India with the rupee issues, you will see this: that when the bank issues are limited, the reserves increase, and *vice versa*. But here you cannot, for instance, reduce the rupee currency without also reducing your reserve.

6093. My point is this. I say, all right, but look at it from the other point of view. However that may be, what appeals to me is that you cannot reduce your reserves without reducing your rupee currency, and that is what I desire to effect?—Quite true, I admit that. But my submission is this. What is the use of a reserve, really? Suppose you have an enormous reserve and you have also an enormous rupee circulation. Does the fact that you have a large reserve in store in some safe in any way affect the value of the rupee? It does not. The value of the rupee will be affected simply by its quantity and the volume of circulation. Its value has nothing to do with the reserve at all. Backing absolutely has no effect on the value of currency except, of course, in times in which it is disorganised. It may lead to some confidence in that currency, but I submit that when currency has come to such a pass that people have to have some confidence, I say that currency has been absolutely inflated.

6094. Accepting, no doubt, the proposition that the value of the currency will be ultimately decided by its total volume in relation to the business?—What I say is this, that this relation is so dangerously correlated, and I am sure you cannot indefinitely go on coining rupees simply because there is a gold reserve. If you go historically into this matter, my submission is that such has really been the case. In the history of India people who have had to deal with currency were so much infatuated by the idea that they must have some reserve that the coinage of rupees was really initiated for that purpose. The coinage of rupees in India in 1893 and 1898 when the Fowler Committee's Report was brought into operation and reforms were introduced is a point. Sir Edward Law was so much obsessed by the volume of rupees in circulation that he felt that there must be some reserve, and it was on this ground that he proposed to the Secretary of State that the Government should be allowed to coin rupees. If he knew properly that the value of rupees would maintain themselves if they were limited in volume, then he would certainly not have gone on increasing the currency. I am recommending simply what the Government of India recommended to the Secretary of State in 1893.

6095. To turn to the immediate point: the function of a reserve under these conditions is to maintain stability, is it not?—I think a reserve ought not to be there. A currency is something like any commodity which maintains its value simply because of the law of supply and demand.

6096. Do you reject the proposition that the function of a reserve is to maintain stability?—Yes, I do. I do not think a reserve has anything to do; in fact, a reserve maintains itself when the currency is limited; it does not maintain the currency.

6097. Let us now consider your practical proposals for the reform of the currency. You say:—"The following, then, are the requirements of my plan for the reform of the Indian currency:—(1) Stop the coinage of rupees by absolutely closing the mints to the Government as they are to the public. (2) Open a gold mint for the coinage of a suitable gold coin. (3) Fix a ratio between the gold coin and the rupee. (4) Rupees not to be convertible in gold and *gold not to be convertible in rupees*, but both to circulate as unlimited legal tender at the ratio fixed by law." A question which does suggest itself to a practical man there is, under those circumstances, how are you to maintain the ratio between the gold coin and the rupee, and how are you to prevent one going to a discount or a premium in comparison with the fall in accordance with the balance of the country's trade?—Well, the rupee will maintain its value by reason of the fact that it will be limited in volume; no more issues of rupees are to be issued.

6098. What is to prevent it going to a premium?—It cannot at once go to a premium because it has a substitute in gold. Rupees are not to be convertible in gold. The rupee cannot go to a discount because it is limited in volume. No more rupees are to be coined. The rupee cannot go to a premium because there is the alternative of a gold coin functioning as currency.

6099. Then you say:—"But there is just this chance: that the existing volume of the rupee currency is so large that when there is a trade depression it may become redundant and may by reason of its excess lose its value. As a safeguard against such a contingency, I propose that the Government should use part of the gold standard reserve for reducing the rupee currency by a substantial margin so that even in times of severe depression it may remain limited to the needs of the occasion." How would that operation take place?—You simply call in rupees and not issue them again—by the process of calling in rupees up to a certain limit.

6100. So that the rupee would not, to that extent, be convertible into gold?—It will never be convertible into gold, until the limit is reached, so that it will never be in excess even in times of depression—the rupee will not be convertible into gold and gold will not be convertible into rupees. Even as it is, I am not very much afraid that the rupee will go to a discount, but there is just this chance that it might. and I therefore propose that safeguard.

6101. Coming then to the question of the ratio, you say: "In European countries the problem is one of deflating the currency, *i.e.*, appreciating it; in

other words, of bringing about a fall in prices. In India the problem becomes one of inflating the currency, *i.e.*, depreciating it; in other words, of bringing about a rise in prices. For a change from 1s. 6d. gold to 1s. 4d. gold means this and nothing else. Should the currency be inflated to reach back the pre-war parity?" Then you point out that the restoration of the pre-war parity is not a restoration of the pre-war price level because there is a change in gold prices?—Yes.

6102. Further, you point out that: "Two things must be borne in mind in this connection. Existing contracts include those made at every stage of preceding depreciations and appreciations, and to deal fairly with all would demand that each one should be treated separately—a task impossible by reason of its complexity and enormity." I understand that the opinion which you emphasise there is that we have been passing through a period of violent fluctuations in the value of the rupee, that at every stage contracts have been entered into, and that it is impossible, as it were, to fix upon any definite ratio which will do justice as between all these contracts made at the varying levels?—Yes.

6103. Then you say that the great bulk of the contracts have been of recent date?—Well, my information is really based upon a small note made by Professor Cannan in one of his articles in the "Statistical Journal."

6104. Are there any statistics available which would give us a correct estimate of the number of contracts?—I think it is a guess for what it is worth; a question of commonsense.

6105. Then you say, "It may be said that the centre of gravity of the total contractual obligations is always near the present." Those premises lead you to the following conclusion, that, given these two facts, the best solution would be to strike an average between 1s. 4d. and 1s. 6d. and say that it is nearer 1s. 6d. than 1s. 4d. I am not sure that I quite follow that. Your trend of reasoning would rather have led me to suppose that you would finally turn out to be a supporter of the 1s. 6d. rate?—I say it may be nearer 1s. 6d. and away from 1s. 4d.

6106. What ratio would you suggest?—It is difficult. Of course, I think 1s. 6d. would be just as good. It could not inflict any very great hardship.

6107. Then, finally, as regards the question of a rising and falling rupee ratio, your opinion is summarised in paragraph 9. You say: "Now if it is realised that a low exchange means high internal prices, it will at once become clear that this gain is not a gain to the nation coming from outside; but is a gain from one class at the cost of another class in the country." Which class gains and which class loses?—The business class gains; the labouring class does not. The price of all factors of production does not change. Wages do not change as rapidly as prices and these are the classes who suffer.

6108. Have you any suggestion to make, either from the theoretical or practical point of view, as regards the important provisions as to the currency arrangements to provide elasticity to meet seasonal demands?—As I hinted, of course, very briefly, if we want to make our currency elastic for seasonal purposes, we must somehow see that the commercial paper which has given rise for trade transactions is converted to currency. So that commercial paper should be made more a basis for the issue of the currency than Government bonds. I think it would be to the good of India if we adopt the proposals in the German Imperial Bank. They adopted, of course, more or less the English Banking Act of 1894 with variations so as to suit the seasonal demands.

6109. That is a provision for the extension?—For the extension for the time being of paper issues under certain regulations.

6110. That is a provision, is it not, for the extension of the fiduciary issue?—Exactly.

6111. In return for the payment of a proportional tax?—Yes, I think it is a sufficient safeguard for both.

6112. (*Professor Coyajee.*) The chief merit of the gold standard is, according to you, that it places certain definite limitations against possible fluctuations?—Exactly.

6113. But, of course, there are certain things, for example, the provision from the mines is not based on how much currency is required by a country?—Yes; I may say that I am in favour of a gold standard simply because compensating systems are not workable. If they are workable, I would at once reject the gold standard. I am not in love with it at all.

6114. Nor does the gold standard ameliorate the consequences of a trade cycle?—No.

6115. Then there is only one point. In paragraph 5 you observe "I am necessarily in favour of the abolition of the gold standard reserve as being of no practical use for maintaining the stability of the currency." By analogy why not abolish the paper currency reserve also because the value of the paper depends upon its limitations?—Quite.

6116. Would you abolish that?—No, for this reason. Because we are not placing a fixed limit on the issue of paper. Under the scheme where I say we should abolish gold standard I am placing a definite limit on the issue of the rupees. In the case of paper currency, we have allowed the Government the discretion.

6117. Do you think that possible? I will tell you why. Because with limited incomes and things like that, there is more scope as population increases for the use of the rupee. Could you say for ever and for ever, we shall be coining gold and no rupees until possibily the quantity of gold in circulation will be ten times that of the rupee? Would that be convenient to the country?—I should think it would be. I would rather say that instead of using gold we use notes backed by gold. I do not mean that we should use gold from hand to hand.

6118. (*Sir Norcot Warren.*) Am I to understand from the latter part of paragraph 8 of your memorandum that you are inclined to the rate of 1s. 6d. rather than 1s. 4d.?—I confess prediliction in favour of 1s. 6d.

6119. (*Sir Alexander Murray.*) There is one point, Dr. Ambedkar, which you referred to in answer to some questions put to you by the Chairman; you seem to suggest that the Government of India were somehow or other prepared to go on coining rupees simply in order that they may make profit between the bullion value and token value of the rupee. I want to know what you are referring to actually?—I am referring to this: It is a historical bit of thing. When the Government of India, for instance, introduced reforms suggested by the Fowler Committee, they felt that for a large circulation of the rupee they had not any reserve and the Fowler Committee in paragraph 60 of their Report suggested that if the Government coined rupees and keep profit to itself, that profit should be utilised as a reserve. Sir Edward Law who came on the scene in 1901, the period from which the coinage of rupees commenced, also felt that the volume of rupees was so large that some amount of reserve was necessary; and I think he went on coining rupees sheerly because he felt that the reserve was wanted and the reserve could not be had in any other way except by coining rupees.

6120. You only *think* that?—No, my point is this: I have read the despatch very closely and I feel that if Sir Edward Law had disclosed there that the rupee was coined to a premium because people did not want gold or any other thing to use in currency, then I could have understood that the rupee was coined in answer to the demand of the people. But there is not a single thing to that effect to be found in the despatch. He simply says that when we introduced reforms we did not take into account paragraph 60 of the Fowler Committee's Report.

6121. But he also, I think, in that despatch to which you refer laid down that there ought to be a gold reserve which estimated at 7 millions or something like that. Against this you say that he was issuing rupees?—Quite so. Gold standard reserve is kept in gold. I say no reserve was wanted.

6122. You make a general statement here, Dr. Ambedkar, "Unfortunately there is abundant proof of such perversion in the history of the currency system in India. Already we have had foolish administrators who had been obsessed with the idea that a reserve was a very essential thing and who had therefore gone on issuing currency without any other consideration but that of augmenting the reserve" and you are now repeating it to the Chairman?—I have used a much milder expression than that used by Professor Cannan himself in his book.

6123. But is it not the case that in 1895 that was actually suggested by a well-known Bombay financier and turned down by the Finance Member at the time?—I find that in the despatch.

6124. One moment. In your book you actually give the name of the Bombay financier who suggested it and you give the name of the Finance Minister of the Government of India who turned it down?—Yes.

6125. Then in your book you also give the name of a well-known politician who as recently as 1907-08 suggested the same thing and again it was turned down by the Government of India and as recently as 1919, you give a reference to another well-known economist. Then why do you repeat the statement to the Chairman that the administrators of the Government of India have not thrown overboard or turned down the suggestion when as a matter of fact you know that the administrators of the Government of India have turned it down repeatedly when it has been put forward by well-known Indian financiers?—My reply to that is this: that somehow if you read the speeches in the budget delivered by every Finance Minister, for instance, I forget the names now, gentlemen who preceded Sir Edward Law; I think I can cite instances.

6126. Sir James Westland and Sir Clinton Dawkins?—But they never agreed with that.

6127. No; it was suggested by an Indian to Westland who turned it down and again to Dawkins who turned it down?—With due respect to your interpretation, Sir Edward Law did say that there should be gold standard sufficient to back all the rupees and the notes. I do not deny that. But I simply say this; that other financiers stated that no reserve was wanted and the rupee would maintain itself and Sir Edward Law stated that the reserve was wanted and he coined rupees because he wanted the reserve. In fact, I have paid sufficient compliments to the training and the notions of Westland and Dawkins for turning down the proposals. I say they were right and Sir Edward Law was certainly wrong.

6128. Sir Edward Law did not say that he coined rupees in order to provide the reserve. He said that he should hold it as a backing against the issue. It is you that put in the interpretation that he did coin rupees for the other purpose?—He says that in the despatch. Before the Fowler Committee there were sufficient proposals of having a gold reserve and the Committee found that they were very costly, but slightly hinted that if a reserve was wanted, it might be had by coining rupees. The two gentlemen who preceded Sir Edward Law did not think it was necessary. But Sir Edward Law said it was necessary and coined rupees. I am not making a general charge. I have given praise where it is due. I can give you also the reference.

6129. I can verify all your references. What do you want to find there?—That although the recommendation of the Fowler Committee was there that the Government of India could provide itself with gold reserve by coining rupees, Westland and Dawkins refused to pay any heed to that proposition, because they firmly believed that gold reserve was not necessary and that the rupee being limited in quantity it could maintain itself. But Sir Edward Law when he became Finance Minister felt that a reserve was necessary.

6130. Westland was the Finance Member before ever the Fowler Committee reported. I think he was away when the recommendations were brought into operation and Dawkins was the member in office when the Fowler Committee reported. But both of them turned down the suggestion which came from Indian politicians?—There is no difference of opinion on that point.

6131. The only difference is that you are imputing to Sir Edward Law that he coined rupees in order to create a reserve. I say that he did not; that in the actual despatch he said that there was a gold reserve, I think, of 7 millions?—If so, there is a difference between us.

6132. (*Chairman.*) I cannot see what conceivable advantage it can be to anybody to increase a reserve for the fun of the thing?—Exactly, and people are under very big notions that a reserve is wanted and without a reserve a currency cannot work. I think it is a very common superstition. It is there.

6133. (*Sir Alexander Murray.*) I will give you the reference, pages 276 to 278 of your book, "The Problem of the Rupee"?—Yes, Westland was there when the reforms were brought into being, page 276.

6134. It was in 1895, he turned down the suggestion?—No, I may refer to the budget speech of 1898-99, after the reforms were introduced.

6135. What date was that?—It is the Budget speech of 1898-99 after the reforms were introduced.

6136. It was in 1894-95.—No; Dawkins comes on the next page. My reference is to the Financial Statement for 1898-99 at page 276. Then the passage from Sir. Edward Law occurs on page 278.

6137. Will you excuse me for correcting you. You said your reference was to the Budget speech of 1898-99. As a matter of fact the reference you have made is from the speech of 1894-95?—He was also Finance Minister in 1899.

6138. He turned it down in 1894-95?—I mean there was no material difference between the Herschell Committee and the Fowler Committee and I am sorry if you think I have made any vile allegation against the gentleman.

6139. (*Sir Alexander Murray.*) All I am doing is quoting what you say in paragraph 5 of your statement. All I say is there is danger of anybody falling into that trap.

6140. (*Chairman.*) And you maintain that in your book you have vindicated these eminent statesmen?—Yes.

6141. (*Sir Purshotamdas Thakurdas.*) In paragraph 8 you refer to various countries of the world as "hankering for a return to the pre-war parity" and you say it seems to be universal. Then you go on "There is but this difference between India and the other countries. The other countries have yet to reach the pre-war parity. India on the other hand has in fact over-reached the pre-war parity." Those other countries to which you refer have had their currency very severely depreciated during the war?—Absolutely.

6142. Not the solvent countries?—I think those countries also which are very near their old parity find it difficult to go back.

6143. For instance, which countries have you in your mind?—Well, I am talking of the proceedings of the Genoa Conference, which I do not carry in my mind, but I think for instance a country like Italy. France was at one time within measurable distance of pre-war parity.

6144. France now is perhaps worst off of all; therefore you are there remarking a difference between India and other countries whose currency was severely dislocated during the war period and who have not yet been able to bring it round?—My point

is, even if we were in a position to go back within a measurable distance it would not be always wise or advisable to go back supposing we could.

6145. I will come to that later on; I am only trying to point out to you that it may be said the comparison you are stating here between India and the other countries is one which cannot stand as far as currency problems and conditions are concerned. So far as the "could" is concerned, I mean the difference between whether we should and whether we could even if they (those countries with depreciated currencies) wanted to they could not go back?—Very good; you have put it much better than I could have.

6146. Therefore if you compare India with the countries which got back to pre-war parity you find that those who could did go back to the pre-war parity?—Yes, for instance England; but there was also a strong current of opinion even in England that they should not.

6147. I mean in spite of the strong current of opinion you refer to they have reconciled themselves to the pre-war parity and you do not hear much complaint now about having gone back?—I could not tell.

6148. You do not know, I see; unless it can be said that those who went back made a mistake, there won't be anything particularly objectionable against those in India who want to return to the pre-war parity?—No, I don't say that. I am really raising the question whether it is desirable.

6149. Now regarding the desirability of it, lower down you say the view is wrong; you say both these views aro fallacious. You say the restoration of pre-war parity is not a restoration of the pre-war price level. Now do you think that exchange should be used as a lever for attaining price levels?—No.

6150. Then, it does not appear to me very fallacious?—No, I say this, although you cannot always say exchange and price level move together, yet . . .

6151. Excuse me, my question was, do you suggest that oxchange should be used as a lever for adjusting price levels?—No, I do not say that.

6152. Therefore a change of ratio from that point of view was not desirable, as a lever for the adjustment of prices?—Yes, it was not.

6153. No country has done it unless you can show that it was particularly desirable in the case of India as an exception?—But it has happened in all countries.

6154. Which countries?—All countries.

6155. If I may make my question clearer . . .?—I do not think your question was put very clearly.

6156. I sometimes do put my questions not very clearly, I admit. Which countries which could attain to pre-war parity did voluntarily go past it in order to adjust their internal price levels?—No, of course they did not do that.

6157. Therefore where is the fallacy?—Fallacy in this sense: some people in doing this imagine they are going back to the old price level. That is a fallacy, because 1s. 4d. in 1914 is not the same as 1s. 4d. in 1925.

6158. But I mean those who do not base the demand for 1s. 4d. on the question of prices at all, they would not be making that fallacy?—No.

6159. Then lower down you mention another point, I think. "If by restoring pre-war parity is meant the restoration of the pre-war level of prices, then the ratio instead of being lowered from 1s. 6d. in the direction of 1s. 4d. must be raised in the direction of 2s. gold." Then you say "the restoration of pre-war parity even nominally would be unjust." What have you in your mind by the words "even nominally"?—Without looking to the price level.

6160. I thought you yourself agreed . . .?—Supposing now, in 1925, 1s. 4d. is the ratio as compared to 1914, that would be only a nominal change because prices have certainly changed.

6161. Where is the nominalness in regard to those who ask for 1s. 4d. as being the pre-war rate?—You are asking for a definite change from 1s. 6d. to 1s. 4d. I take my starting point, as I have stated at the end of the statement from what we find actually there. I say, "In short, in matters of currency the real is the normal." I therefore start from 1s. 6d. as the normal.

6162. Now supposing the exchange to-day, when we are discussing the thing, was 1s. 8d., I take it you would urge the same ground for 1s. 8d. being confirmed as you have for 1s. 6d. being confirmed?—Yes.

6163. So whether exchange had gone up to 1s. 6d. or not the ground would prevail irrespective of what other countries have done; and irrespective further of how that point was reached?—May I just explain it in my own way?

6164. If you please.—The way in which I look upon this problem is this. To-day we have 1s. 6d. That to my mind means a certain price level. If you want us to go back to 1s. 4d., it seems to me we have to raise our prices. Without increasing the volume of currency we certainly cannot reach 1s. 4d. gold. Therefore the complete question to my mind is, shall we raise our prices from what they are to-day, so that wo can go back to 1s. 4d.? Now I being a member of the labouring community, feel that falling prices are better. That is my view of the matter.

6165. Let me take it the other way. You say, as you put it, that, being a member of the labouring community, that means from the point of view of the labouring class it is undesirable?—Yes, and I may go further and say that from the national point of view too falling prices are better than rising prices.

6166. Now I suppose you heard the arguments that are being advanced that a high exchange, an exchange which is worked up to a higher point than where it has been 15 or 20 years at a stretch is undesirable in the interests of the producer. What would you say to that?—All that it means is a depression of profits. I do want to make a distinction,—I do not know how far people will appreciate that,—between depression of industry and depression of profits. I think that distinction was made by Professor Marshal in his evidence before the Gold and Silver Commission. There might be a depression of profits, that is to say, the enterprising class may not get all that they would get if prices were to rise; but it does not necessarily follow.

6167. Excuse me; cannot I refer to the producer? We will come to the investor later if you don't mind. But what about the producer: in his case the higher the exchange the less the number of rupees available to him?—It doos not matter to him at all, because he spends it. His cost of production also falls; therefore it makes no difference. If he got 15 rupees, and if the 15 rupees purchased a certain amount of goods, and if five years hence he got 10 rupees, and that 10 rupees purchased as much as 15 rupees before, the change is only a change of counters.

6168. When the adjustment is complete? But until then there is disturbance?—Yes.

6169. Now let us look at it as far as the present goes. You think that the average Indian cultivator rarely employs any labour and cultivates with his own hands?—Well, I suppose he does employ a certain amount of labour.

6170. In the ordinary course, for the adjustment to be complete, you would expect that the wages he pays to his labourers also go down?—Yes. I mean if he wants to get the same amount of profit, I would say yes.

6171. Very well, if the wages of the farmer's labourer have not gone down you would admit that to that extent the farmer has a smaller profit?—Smaller profit, yes, I admit that.

6172. And in cases where the farmer is just able to make both ends meet he loses?—No. He does not get profits, but he does not lose. Profit is something else; it is surplus.

6173. Where a farmer or a class of farmers in a district make just enough to make both ends meet they would be losing, inasmuch as the labour charges have not gone down in proportion?—I do not know how you define profit. I define profit as surplus income.

6174. After paying all charges of production?—Yes.

6175. If in 1921 a farmer made both ends meet and in 1924 when exchange was stabilised at 1s. 6d. as far as his produce is concerned and his labour charges have not gone down, he would certainly make less?—He would lose part of his profits.

6176. He will save so much less?—I would stick to the word " profit."

6177. He will make less profit?—Yes; there would be a depression of profit.

6178. To that extent of course the producer will be a loser?—If you think that he had a legitimate right to that profit, then of course you would be right in saying that he loses; but not if it was a merely differential gain.

6179. At 1s. 4d. it was merely a differential gain?—Yes.

6180. Lasting for a period of 25 or 23 years?—As I say it all depends upon how you define it.

6181. How would you define it yourself?—So long as he is able to recover all that he has spent in production I do not think that he would be a loser.

6182. And you would apply that test to every person?—I would say that he has made both ends meet.

6183. Do you think that would be the maximum which the average citizen would like to apply in his own case?—I can give no opinion upon that, I am afraid.

6184. Now, you mention in paragraph 8: " Two things must be borne in mind in this connection," and lower down you say: " Existing contracts are no doubt of various ages." What sort of contracts have you in mind there?—Leases for instance: and other contracts also, such as building contracts and so on.

6185. How would they come in with the question of exchange?—They are money contracts just the same; they are all money contracts.

6186. Every contract, then, you mean?—Yes.

6187. If a man was putting up a house in a mofussil rural place for 4,000 rupees, that also would come under this?—Of course; it is investment of money.

6188. You have in mind everything that involves investment of money in the country?—Yes; it has purchasing power.

6189. Then you say: " Given these two facts, the best solution would be to strike an average between 1s. 4d. and 1s. 6d." Why did you mention an average instead of 1s. 6d.?—I say so because in 1925 there may be some contracts which were made when the ratio was 1s. 4d. Some contracts may be still subsisting made at that period when the purchasing power was at the rate of 1s. 4d., and therefore to give justice to all I think that is the best way it could be done.

6190. What about contracts in the shape of debts incurred before 1914?—I do not suppose there are many existing now.

6191. You think that all these debts payable by agriculturists to sowcars are paid within a certain period?—My personal opinion is that no commercial contract extends for more than five years, and the proportion of those is very very small. There is no statistical information on this. Professor Fisher has made in his book certain calculations to that effect. He writes there that the rate of interest varies sympathetically with the prices; so that the rate of interest bears a certain relation to the rise or fall of prices. He then comes to the conclusion that most contracts are very very recent commercially.

6192. You mean about India?—I mean generally; I do not know about India in particular; there may be something peculiar in India, but I do not know why it should be so.

6193. Do you think things in India may be different?—I should not think so unless there was some evidence forthcoming that that was so.

6194. You think that the problems in India are the same as in the West?—I do not see why they are not.

6195. It would surprise you if thoy happened to have been admitted to be otherwise?—It would surprise me.

6196. Regarding the adjustment of price levels, do you think that the adjustment is anything near complete now, owing to the disturbance in the exchange rate from 1s. 4d. to 1s. 6d.?—There would be some disturbance; that would be detrimental to the wage-earners if we went back from 1s. 6d. to 1s. 4d.

6197. The disturbance from the lower to the higher rate from 1s. 4d. to 1s. 6d. . . . ?—Has been favourable to the labouring classes.

6198. Is that adjustment complete, or is there still any maladjustment of that?—I could not say; that is a matter of statistical investigation which I have not entered into; but I suppose exchange has been stable at 1s. 6d. for a long time.

6199. How long do you think it has been stable?—I cannot exactly say; but certainly it shows signs of stability.

6200. How long; have you any idea? Some witnesses have said six months, some eight months . . . ?—I think somewhere there.

6201. Do you think that that six or eight months is a sufficient period for judging this stability?—I say due weight should be given to it, and therefore that you should strike an average.

6202. But I think you have said in the course of your oral examination that you would be prepared to agree to 1s. 6d.?—Yes, because it is nationally better; it would not inflate. That is what I say. If, even after 1s. 6d., the process of adjustment was not complete so as to enable us to say 1s. 6d. was really the level needed, I say we should establish it at that.

6203. Regarding the adjustment in the industries here, have you any idea at all? Can you give us any opinion?—None whatever.

6204. (*Mr. Preston*): In case there should be any misunderstanding with regard to some of the answers which you gave to Sir Alexander Murray, in connection with that unfortunate reserve, the gold standard reserve, it may be well if we put on record some actual facts: the gold standard reserve came into being in the year 1901 and it resulted from profits earned from the previous April in 1900. The balance in the reserve to-day is 40 millions sterling, is it not?—Yes; I think it is about that.

6204A. The Finance Minister when he made his report on currency last year made the following statement: " As will be seen from the statement, the bonds and stock purchased are due for repayment within the next few years. Of the amount now standing at the credit of the reserve, £27,449,950 represents profits on coinage and the remainder represents accumulated interest on securities held in the reserve." You say that this reserve cannot increase unless there is more rupee coinage. How has that increase of one-third in the last three years come about?—By interest on investments.

6205. Then if the interest on that reserve is kept being added to it, you are increasing that reserve for a useful purpose without having to adopt those methods which you so very strongly deprecate?—Yes, undoubtedly.

6206. Just one more point as to the usefulness of that reserve. It will be within your knowledge that in the period of the world's depression in 1908 that had it not been for that very reserve we could never have maintained our external parity; you admit that?—Yes.

6207. Thank you?—Although, of course, something has gone in to which I ought to take exception—by saying that I am in favour of increasing the gold

standard reserve by investments. If a reserve is invested there is no reserve at all.

6208. (*Sir Reginald Mant.*) I understand your chief desideratum is stability of internal prices?—Quite.

6209. And you hold that that stability will best be secured by a gold standard with a gold currency?—Yes.

6210. Internal prices will then be linked to gold prices, will they not? They will vary with the gold prices?—Yes.

6211. Now a gold exchange standard without a gold currency has been recommended by several people with the same object in view; but I understand you to hold that it will not achieve that object?—I think it has not, so far as India is concerned.

6212. I was not speaking of what has been done in the past; it has been represented to us that if a gold exchange standard were made automatic it could secure those objects?—I do not know; there may be some people who hold that view, but I cannot see how it could be held.

6213. I want you to explain why a gold currency would achieve it and the gold exchange standard would not?—My first ground is this: that the exchange standard depreciates gold and makes it therefore useless as a standard of value. A gold exchange standard causes a redundancy of gold by its economy.

6214. Ought you not to put it the other way, and say that if we introduce a gold currency here we shall appreciate gold; would not that be a more correct way of putting it?—You might put it that way, yes. Therefore under the present circumstances gold would behave as a better standard of value. My next submission is this, are we really effecting economy by the exchange standard?

6215. I was not raising the question of economy. I was trying to get at the reason for your holding that nothing but a gold currency would effect your object of keeping internal prices linked with gold?—Stabler than they would be otherwise is what I said. If we adopted a gold standard our prices would be more stable than they would be under an exchange standard. I did not say that under a gold standard they would be perfectly stable because gold itself is not a perfectly stable standard of value; but certainly it would be more stable than under an exchange standard.

6216. Because simply we should be using more gold?—Yes.

6217. That is your only reason for differentiation?—Yes.

6218. (*Sir Maneckji Dadabhoy.*) Let me proceed a step further with regard to the answers you gave to Sir Purshotamdas Thakurdas: in paragraph 8 you say "Existing contracts are no doubt of various ages; but the great bulk of them are of very recent date and probably not more than one year old; so that it may be said that the centre of gravity of the total contractual obligations is always near the present." When you are referring to this matter, I understand you are speaking without any definite statistics?—Yes; I simply say there has been a calculation made by Professor Fisher.

6219. You state this as a sort of generalisation?—Yes. I said I had no definite information.

6220. When you speak of a centre of gravity of the total contractual obligations being near the present, it is not a very definite term. Would not that centre of gravity come within the circumference of twelve months?—Yes, somewhere about that; because I have said one year old.

6221. So that, if a certain ratio prevailed twelve months ago, we would be, according to your reasoning, as much justified in taking that as 1s. 6d.?—Quite; yes.

6222. So you would be as much justified in taking that?—Yes.

6223. Then when discussing this matter and when you expressed your election in favour of the 1s. 6d. ratio, I understand you founded your opinion on the dictum of Professor Fisher?—Yes.

6224. Now we have got this dictum of Professor Fisher before us; the words used are:—"The problem of a just standard of money looks forward rather than backward; it must take its starting point from the business now current, and not from imaginary pars before the war."?—Exactly.

6225. Don't you think that Professor Fisher when he laid down that dictum had European conditions before him only?—Yes, but that would apply almost to any country. It is a general proposition.

6226. My question is did he not have European conditions in view only when he said that?—I cannot say.

6227. (*Chairman.*) The witness replied that he thought it would apply to any conditions?—Yes, it is a general proposition.

6228. (*Sir Maneckji Dadabhoy.*) Is that conclusion justified by these expressed words?—I should think it is.

6228A. You think it is?—He says further, he does not only refer to the war,—he says: "One might as well talk of restoring the original silver pound or returning the monetary standards of Greece and Rome."

6229. Now, you know very well that this ratio of 1s. 6d. has continued in India for the last 16 months only. Now, if we take this period 16 months in Indian conditions, what would you say when you think of any imaginary pars before the war? Do you think in India a period of 16 months would make any substantial difference in coming to a conclusion? He is referring to the imaginary pars before the war; he takes a longer period?—No, no. He is simply referring back to 1914, to the parity which existed in 1914. I say, if according to information 1s. 6d. has been in existence for 16 months, then I say it ought to be confirmed.

6230. Yes. But if previous to that, with a brief interval of some years, it has ranged equally for 20 years at 1s. 4d. you would brush aside all those considerations?—Yes, because there are no contracts now existing that were made 20 years ago. And therefore we need not be concerned about it.

6231. That is your argument? And you would also brush aside its economic effect both on agriculture and on the industries of the country?—I say they will be very good. By bringing the ratio to 1s. 6d. I say there might be some depression of profits, but there won't be depression of industry.

6232. Yes. So you don't attach great value to those factors. You think on the whole it will be for the good of the country?—Yes.

6233. I will put you another question, a little bit imaginary. We will take 6 months to write out our report. Within the next 6 months if the ratio becomes 1s. 8d. I suppose you would be justified in taking that according to you as the basis of your calculation?—Then I would again say, you should strike an average.

6234. Between 1s. 8d. and 1s. 6d. or 1s. 4d.?—Between 1s. 8d. and 1s. 6d.

6235. And you think that would be a sound financial policy?—Well I don't know. You have to strike some sort of average. You can't do justice to each individual contract. For instance, if you take the example of the American War of Independence and the monetary fluctuations that took place then, all that the Americans could do was of course to do this kind of thing,—to strike an average and to dissolve all contracts on that basis. They could not do justice to each individual contract. It is impossible.

6236. (*Sir Henry Strakosch.*) Dr. Ambedkar, I want to refer back to some statements which you made in regard to the undesirability of introducing a gold exchange standard. At one period of your evidence you stated that the convertibility into exchange would not limit the issue of the currency and would therefore not produce stability of internal prices. That was one of the objections you raised and then at another point you said that the gold exchange standard is not a desirable standard because prices would be less stable under it than under a full-fledged gold standard?—Yes.

6237. Now, you are a student of economic affairs and you have no doubt followed the proceedings of the Genoa Conference?—Well, I did when I was in London. Recently of course I have not. But I know that the gold exchange standard was proposed.

6238. Well, you will remember that the Genoa Conference an International Conference adopted unanimously a proposal enjoining the countries to adopt the gold exchange standard with a view to stabilising the purchasing power of gold and that they recommended for that purpose the co-operation of central banks?—I don't suppose they did it with a view to stabilising the purchasing power of gold; they did it to stabilise their own currency.

6239. They stated definitely it was to stabilise the purchasing power of gold. Anyway, you can take it from me that it is so. Now, that is an international body and they have come to that conclusion and they apparently do not share your view that the gold exchange standard does not produce, as great a measure of stability internally as the gold standard?—Oh no. My submission is that we are comparing the gold exchange standard to a purely inconvertible standard. The belligerent countries had during the war an absolutely inconvertible currency and certainly an inconvertible currency is much worse than an exchange standard because it has some convertibility. As I have stated myself in sub-paragraph (2) to paragraph 2. They were not comparing the gold standard to the gold exchange standard; they were comparing the gold exchange standard with the paper currency they had.

6240. But I submit they did not compare at all. They made a recommendation?—But in reference to the circumstances that existed then—I should limit it that way.

6241. Well, anyway, that is a fact. Now, quite apart from that, I am not quite sure what makes you think, apart from a change in the purchasing power of gold itself, why the gold exchange standard should not be as stable as the gold standard. I don't quite follow that, and, before you answer, I should like just to define what I understand by a gold exchange standard. A gold exchange standard is a standard where there is circulating within the country a currency which is not convertible internally, but which is freely convertible externally, and you could make that currency convertible into gold for export purposes. Now, taking that standard, I should be very glad if you would tell us why such a standard is less able to maintain stability than a gold standard?—I follow your question, Sir. And my reply is this. Convertibility is a means of limiting the volume of currency to the needs of a country. A convertibility which is intended only for external purposes is not of sufficient efficacy to limit the volume of that currency. Consequently you cannot have stable internal prices to such a currency.

6242. Why do you say that it is less efficacious than convertibility for internal purposes?—Because convertibility to be effective must be absolute.

6243. But it is absolute?—It is not.

6244. But obviously it is. It is absolute. The difference is only that in the one case you convert into international money for international purposes, and in the other case you convert for either international money which is used internationally or international money which circulates within the country?—No, no. The point is this. When your obligations to convertibility are imperfect as in the case of the exchange standard you are likely to issue more currency without fear.

6245. But you just said that the obligation to convert limits the issue in both cases?—Yes, but converting depends upon the efficacy of the means of convertibility. If your convertibility is absolute, that is to say, if an issuer is bound to convert whenever he is presented with his currency, then that convertibility is absolute.

6246. But my proposition was that the gold exchange standard binds the issuing authority to convert the internal token currency into gold for external purposes?—And not for all purposes.

6247. Now, I want to know why the obligation to convert the token currency for internal purposes should increase the stability of the purchasing power of that money?—Because the principle is that any commodity, and currency included, maintains itself by the fact that it is limited in volume, in supply. That is the first elementary proposition of political economy; that any commodity maintains itself by reason of the fact that the supply is limited. If the commodity supplied is not limited, it is bound to depreciate.

6248. Do you then contemplate that in your gold standard with gold currency, there should be nothing but gold coin circulating?—No, I say that the rupee shall circulate.

6249. And no bank notes?—Yes, there will be bank notes: why not?

6250. Then, I don't see how you are limiting more effectively the internal issue in the one case than in the other?—Because I am saying that the mint shall be closed.

6251. What about the issue of banks notes?—They are covered. A covered note issued is not an addition to currency. Supposing you deposit a certain amount of gold in the bank and you issue so much currency to cover it, that currency is not an addition to the currency.

6252. Oh, you want to have notes covered by 100 per cent. gold?—Well, I don't say 100 per cent gold.

6253. Then how will you limit it?—I mean convertibility is a method of limitation. I will have paper currency which is fully, absolutely convertible and not merely for the purposes of external trade. And I will have the rupee absolutely fixed in limit. So that it will maintain its value by reason of the fact that it is limited. The paper currency will maintain its value by reason of the fact that it is convertible.

6254. And how will you manage the seasonal requirements of currency?—Well, I say you can expand the fiduciary portion of the currency so as to allow for currency being issued against paper during seasonal demand.

6255. Do you not put it here at the discretion and will of the issuer?—Yes, but there is this convertibility which regulates the discretion. Convertibility is a means by which the will of the issuer is regulated. There will be no danger. Although I admit that even under the gold standard, the gold may absolutely pass out and the country may only be inundated with paper notes.

6256. Would you say that the obligation to convert into an international currency at two given gold points is sufficient to ensure the stability of money, because, if you over-issue internally, your money will depreciate in relation to gold?—Yes, I admit it, but it will be long after. There will be a long interval before that thing may happen and in the case of some countries, it may not happen.

6257. How was the gold standard worked before the war in Europe and other countries?—It worked on the basis of convertibility, not only convertibility for external purposes.

6258. But was that standard not in the main worked, by the central banks not converting into gold but holding foreign exchange, and only in the last resort was gold flowing from one centre to another?—But their arrangements as to convertibility were perfect and absolute.

6259. You also know that a great many of the countries on the Continent of Europe who had perfectly stable currencies had practically no gold in circulation?—Yes, that was so.

6260. (*Chairman.*) We are much obliged to you, Doctor, for your very full assistance to-day.

(*The witness withdrew.*)

SEVENTEENTH DAY.

Wednesday, December 16th, 1925.

The Right Hon. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Maneckji Byramji Dadhabhoy. K.C.I.E.
Sir Henry Strakosch, K.B.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.

Mr. G. H. Baxter (*Joint Secretary*).

Mr. Shivpratap Joshi, Mr. Ramchandra Baid, and Mr. Umashanker Dikshit, representing the Marwari Chamber of Commerce, called and examined.

6261. (*Chairman.*) Mr. Shivpratap Joshi, you have come here to-day as the Houorary Secretary of the Marwari Chamber of Commerce in Bombay?—Yes.

6262. And you have with you Mr. Ramchandra Baid, member of your Chamber, and Mr. Umashanker Dikshit, who is the Assistant Secretary of the Chamber?—Yes.

6263. Your Association has been kind enough to provide us with a very full memorandum,* in which it sets out its views upou the currency problem. In the first place, for the benefit of those of us who are not well acquainted with the subject, could you tell us, Mr. Joshi, what is the nature of the business interests which are represented by your Association?—The nature of business is this: They are commission agents, shroffs and bullion dealers. They send goods to up country, and they are also bankers.

6264. As regards the nature of the business of a shroff, could you just give us a brief description?—They do business; they lend money. Not only they lend money, but they accept hundis or honour hundis of their up-country clients.

6265. Who are the clients of the shroffs?—The up-country dealers.

6266. Dealers in?—Iu every kind of commodities; gold bullion or imports or exports.

6267. What is the number of members of your Association?—The number is 281.

6268. I will, if I may, ask you a few questions on your memorandum just to assist us to understand your views. I am going to deal in the first place with the question of the ratio of the rupee. I find set out in paragraph 6 of your memorandum an analysis of the bad effects of raising the ratio; in paragraph 7 there is an analysis of the bad effects of reducing the ratio; and in paragraph 8 you say your committee consider both alternatives as highly objectionable and inadvisable. You come to the conclusion, "Therefore any attempt to adopt a higher or lower ratio is highly undesirable." Your memorandum presents me with a real difficulty. Supposing I am convinced as it were by your arguments that it is a bad thing to raise or lower the ratio, and supposing I accept your conclusion, "Therefore any attempt to adopt a higher or lower ratio is highly undesirable," then I am so puzzled when I come on to paragraph 10 and find that your committee suggests that the ratio of 1s. 4d. should be reverted to, because it does not seem at first sight consistent with your recommendation in paragraph 8 that any attempt to adopt a higher or lower ratio is highly undesirable. You see my difficulty, I am sure?—But I think it is no difficulty; because after the war the level of exchange has been lowering, and it was coming to the normal stage, and it was due to starving our country of currency that the exchange rate was raised.

6269. But the effects which you describe in paragraphs 6 and 7 are the effects, mostly bad according to your arguments, of raising or lowering the rate, and that means, as I understand it, raising or lowering it from whatever given rate you start with; and you come to the conclusion that raising or lowering is therefore bad. But your recommendation of 1s. 4d. does involve a lowering, does it not, because we are not now at 1s. 4d., and I want to see why it is you recommend the adoption of 1s. 4d.?—Our recommendation is above or below the gold ratio. We have accepted 1s. 4d. as gold par, and so the objectionable ratio is either below 1s. 4d. or above 1s. 4d. That is my meaning.

6270. Is what you say in paragraph 7 as to the evil effects of lowering a ratio not directed towards moving from the prevailing rate, whatever it may be, to some lower rate, or does that argument apply, as you now tell me, to moving to a lower rate from some other formal rate which is not that which exists at the time when you begin the movement?—My meaning is "lower than 1s. 4d. or higher than 1s. 4d.," and if that is accepted I don't think there will be any difficulty.

6271. Perhaps you could elucidate paragraph 6 for us by telling us what precisely is the meaning of your phrase, "our gold par before 1920 was 1s. 4d." The phrase does not seem to be very clear at first sight. I want to know just what you mean by that phrase?—That is our old price of gold, 7·53 grains.

6272. That was established by provisions as to the purchase and sale of sterling under the gold exchange standard?—That was the figure chosen as being maintainable in any way.

6273. You select that as your chosen rate because it was then the legal rate?—Yes, Sir.

6274. Just in the same sense as 1s. 4d. was our legal rate before 1920, so our legal rate is now 2 shillings?—That 2 shilling rate was not maintainable.

6275. But when it was 1s. 4d., how did they differ?—We think 1s. 4d. could be maintained if steps could be taken in favour of it, that is, by giving our country free gold.

6276. That is introducing an hypothesis as to what might have happened, and I want to consider only what has happened. I suggest to you that if you are going to select the rate on the ground of what rate is legal, you must now take as your gold par the 2 shilling rate?—We do not accept the 2 shilling; that broke down in a time of adverse balance of trade.

6277. But so has the 1s. 4d. rate?—I do not think that will break down.

6278. Does not the matter stand thus? There are two things to take into consideration, either the legal rate or the actual market rate which prevails now. The market rate which prevails at the present time is

* Appendix No. 30.

round about 1s. 6d., and the actual legal rate is 2 shillings; so I still do not see for what reason you adopt a rate which was once the legal rate, that is 1s. 4d., in preference to another?—The thing is our experience has shown this is the only rate which can be maintained in any circumstances.

6279. I will come to that presently. Finally on this question, is it not a fact that your arguments in paragraph 7 as to the evil consequences which result from a falling rate apply in common sense to the process of falling from the existing market rate of the day to some lower rate, and that therefore one criticism of your recommendation of 1s. 4d. is that it will involve all these evils you describe in paragraph 7 by moving to 1s. 4d. from the current market rate of 1s. 6d.?—But we say that all these are temporary effects; the evil effects will be only temporary.

6280. Even if the evil effects will be temporary, why incur any temporary evil effects unless you must?—Suppose you are not going to revert to the pre-war ratio we shall not be able to keep any new ratio: that is our contention.

6281. I do not follow that. Perhaps I have not quite appreciated your real reason for preferring the 1s. 4d. rate yet; but let me pass to the very interesting question which you now suggest. I understand it is your opinion that the 1s. 4d. rate can be more easily maintained, once it is enacted, than the 1s. 6d. rate?—Yes, Sir.

6282. I think the point of view you have to adopt in order to establish that proposition is this, that the maintenance of a rate depends only at bottom upon the volume of the currency of the country in relation to the business done by the country; and that any rate can be maintained with the same ease once you have contracted or expanded the currency of the country to an appropriate degree to maintain that rate. It is, therefore, not sound to say that one rate is more easily maintainable than another. I can summarise the contention in this way. The way in which the matter would have to be put is this, that such and such a rate is unattainable because it demands a contraction or expansion of the currency which is impracticable and might be ruinous, but that once the adjustments involved in adopting one rate or another have taken place then any rate is equally maintainable?—We can mainain any rate with our gold reserves but our idea is that for the 1s. 6d. figure we cannot accumulate enough reserve, and without having enough reserve it is not maintainable.

6283. The function of a reserve is this, is it not, to maintain stability against whatever fluctuations in the supply and demand for internal and international currency may follow from alterations in the balance of trade?—Yes in the balance of trade but afterwards gold is required.

6284. Are those fluctuations affected in their absolute size by the rate which you are trying to maintain?—After all the accounts are adjusted by the import of gold or the export of gold.

6285. Not necessarily by that. That perhaps would not be relevant to the contention.—(*Mr. Baid.*) May I also say a word?

6286. It would probably be an advantage to your colleague if you make any additions now before we go so far that we forget what the point was.—(*Mr. Baid.*) The Chamber is definitely of opinion that the ratio should be 1s. 4d. and not 1s. 6d. in the interests of the country as a whole. Of course this ratio of 1s. 4d. has worked very well from 1898 to 1920, except 1907-08; so for many years this ratio has worked very well; therefore we need not go to another ratio for our exchange purposes.

6287. That brings us back to the point on which I was trying to get my mind clear in regard to Mr. Joshi's remarks. You say we need not go to another ratio, but the point I am drawing your attention to is that we are now at another ratio?—True we are now at 1s. 6d. but at 1s. 6d. the country as a whole is a great loser. India is agricultural and its agricultural products suffer so much by two pence when we keep the rate at 1s. 6d.; and again our industries also suffer greatly to the amount of two pence; and so we do not want our agriculture and our industries to suffer so much by keeping the rate at 1s. 6d., we being an exporting country mostly, we wish by keeping the ratio at 1s. 4d. to gain so much national wealth.

6288. There again you involve me in just the same difficulty as regards your memorandum as that to which I was referring in my questions to Mr. Joshi? —What I understand from you is this that there shall be hardship to some.

6289. Let me just finish my question, otherwise we may lose the thread. What I was going to say was this. You say the country is suffering hardship from the 1s. 6d. ratio as the result of the rise. Do you agree with the opinion expressed in the memorandum that the hardships involved in a rising ratio are temporary?—No, Sir.

6290. You do not agree with that opinion expressed in the memorandum? The opinion is expressed here in paragraphs 6, 7 and 8 of your memorandum that the hardships involved in a rising or falling exchange are temporary. I think we ought to know whether we are proceeding on a common basis. You do agree with that?—Oh yes.

6291. Then I am going to continue now, if I am not interrupting you. If that be so, are you, or are you not, of opinion that prices have adjusted themselves to the 1s. 6d. ratio, and that those adjustments which follow from the rise in exchange have now been completed?—There are so many factors in prices. Outwardly speaking the effect of a rising or a falling exchange seems temporary; but when once we have established the ratio, we had 1s. 4d. before and now we have 1s. 6d.; now we have got this ratio of 1s. 6d. and at this 1s. 6d. ratio our country is placed in a very suffering position and that bad effect of course underlies all the transactions.

6292. I follow that general opinion, and it is the basis of that opinion which I am attempting to explore. Just to resume the thread of the questions which I was asking, the next is this. Is it your opinion, or is it not, by referring to such statistical information as is available, that Indian prices have adjusted themselves to the current rate of 1s. 6d.?—(*Mr. Joshi.*) If that ratio is legalised even in that case they have not been adjusted as yet.

6293. This is not a question of any formality or legality. This is really a practical question as to whether those effects to which you refer here as following from a rising exchange have yet in substnace had their full result on Indian prices?—(*Mr. Joshi.*) Yes they have. (*Mr. Baid.*) The result has been that our industries have suffered. See the condition of cotton. It is in an extremely bad condition and that is one of the results of the exchange going up from 1s. 4d. to 1s. 6d.

6294. I have some little difficulty in following your answers unless one of you gentlemen answers at a time; because otherwise I discern a slight danger of answers creating a little confusion in my mind as to what the effect of your reply is, as Mr. Baid does not always appear absolutely in agreement with Mr. Joshi. (*Mr. Baid.*) I thought you were addressing me, Sir.

6295. Mr. Joshi, your opinion is at any rate that prices have adjusted themselves to the new level?—Yes.

6296. If prices have adjusted themselves to the new level, if we adopt a lower level that would involve the disturbances to which you refer in paragraph 7?—But they have adjusted; after adjustment also we are losers at this ratio; the country as a whole is losing.

6297. If the adjustments have taken place and the country is still losing, that I fear is in contradiction of the opinion expressed in your memorandum that the effects of such falling or rising rates are temporary effects only?—Rising or falling are temporary; but when they have risen or fallen that effect remains.

6298. At the end of paragraph 5 you say the effects of a rising or falling rupee are comparatively speaking, temporary. Now you have told me that prices are adjusted to the present level of 1s. 6d. but the country is still suffering from the consequences of that rise. That appears to me to be irreconcilable with your expression of opinion that the effects are, comparatively speaking, temporary. But let that pass. Let me ask you, Mr. Joshi, what in your opinion are the evils from which the country is now suffering as a consequence of the rise to 1s. 6d.?—The producer can get less for his produce, and the national industries are suffering.

6299. Prices have fallen as a consequence of the rise in the rupee, and the producer can get less for his produce?—Yes.

6300. You must remember that we are proceeding on the basis that the adjustments are complete, and if he can get less for his produce he has also to pay less for what he buys. Does that not effect some compensation?—No; it is not so; he buys less than he sells.

6301. It would follow from that answer that only the prices of what he sells have fallen and not the prices of what he buys. Is it your opinion that he is still paying the same price for what he has to buy? —He gets less for his produce.

6302. But the value of the money which he gets for what he produces is greater in consequence of the general fall of prices, is it not?—No; he is getting less, not more.

6303. Let me ask you one or two questions about the next aspect, that is, the aspect of the gold exchange standard and the currency standard. I should like to ask you one or two practical questions about that. I imagine that in your sphere of business you have a very intimate acquaintance with the silver market?—Yes; we are doing commission agents' business.

6304. In silver bullion?—We are executing orders of up-country agents.

6305. That is the market you have to follow?—Yes.

6306. I wonder if you can give any assistance to the Commission in understanding some of the social and political effects of the proposals that have been put before us. In the first place, somewhere in the memorandum I think you refer to the possibility of an import duty on silver?—No.

6307. Nevertheless that is a proposal which in various ways has been put before the Committee. What in your opinion would be the effect of the re-institution of an import duty on silver imported into the country?—When the country gets a gold standard, I think there is no harm in putting a duty on silver.

6308. I am thinking really of what people would think about it. It would have the result, of course, that people in India will have to pay more for their silver than the rest of the world, if silver was dearer here than elsewhere?—But India will not buy silver at the higher price; they would buy less silver. India always buys the cheap metals; the cheaper the metal the more they buy; so India will buy less silver and consequently by instituting this duty on silver, prices in other countries will fall.

6309. Do you think it would have a real effect upon the world price of silver?—I think it would not have any effect.

6310. It would depend upon the scale of duty, would it not? What I am thinking of is this. Supposing that people see that silver is dearer in India than elsewhere, will that have any effect in making them stop buying silver and making them turn to other commodities?—Yes, they would buy gold; they would buy what was cheaper.

6311. If silver looks higher, then they would buy gold?—Yes.

6312. I want to contemplate another possibility. Supposing that currency changes make it necessary for the Government of India, when introducing a gold currency, to get rid in course of time of a large quantity of silver, shall we say about 200 crores, and supposing that can be spread over about 10 years, so that about 20 crores would have to be marketed every year, does your acquaintance with the conditions of the silver market as a whole enable you to express any opinion as to what effect those sales would have upon the price obtainable for the silver?—The first thing I want to say is that there is no need for selling silver.

6313. You start by saying there is no need to sell silver. That is an interesting opinion; but how would you avoid that? I must just explain it a little more to you. The Government introduces a gold currency; it limits the legal tender of the rupee; then its stocks of silver in its reserves are no longer of any use; they are not wanted. It is a big value, and the realisation of that value will give the Government something to set against the expenses of the scheme. Can you suggest any way in which the Government can realise that value without selling its silver?—Yes; I do not see that there will be any cost if you come to a gold standard.

6314. What is to become of India's silver if it is demonetised?—It will circulate as it is.

6315. What about the 90 crores of reserves of the Government of India?—India is a very large country. This 90 crores is not such a very big stock for India; there are 32 crores of people.

6316. The amount of rupees actually issued is somewhere in the neighbourhood of 600 crores; so that 400 crores may be left. Remembering that your proposal is to reduce the silver rupee to the position of small change, to that of the shilling in England, one result of that would be, would it not, that anybody who holds silver in hoards will want to get rid of that silver as his store of value if it ceases to be legal tender?—No; that is why therefore we say that you must not have this limited legal tender in the beginning; it must be unlimited legal tender for the present.

6317. But ultimately?—Even ultimately the legal tender should be large and if it is large ultimately the people whose earnings are not so big can have rupees also; those rupees will not return.

6318. Supposing I have a lakh or two lakhs of rupees in my chests as a hoard, as a store of value, and supposing I am told that the Government of India is going to make the rupee no longer legal tender, even for so big a sum as a thousand rupees, do you not think that I should be very anxious to change those rupees into something else?—We do not think that rupees in such large amounts are accumulated by big persons. Only the small people accumulate rupees to a certain amount; their earnings are not much and so they need not go and change it into gold.

6319. Have you been able to estimate the amount of rupees in hoards?—I think it might be about 200 crores.

6320. There are 200 crores in hoards and there are another 90 crores in the reserve?—Not even 200; I think it is less.

6321. In view of that great amount in hoards, do you think there is any practical possibility of the Government's reserve of 90 crores being worked off as small change under your system for one hundred or two hundred years to come?—We think that all those rupees will not return; India is not a country like America; India is not so rich.

6322. It is your scheme finally to make the rupee no longer unlimited legal tender, but you do not propose to give any option to people to convert their rupees into gold before you limit its legal tender?—Yes.

6323. Do you think that would be fair to the holders of the rupees?—Why not?

6324. They will say: "We have been encouraged to put our savings into rupees on the basis that they are full legal tender, and now, without giving us any chance of getting rid of them, you go and destroy part of the value of our holdings."?—It is not

destroyed. When the rupee is circulating and the limited legal tender is for a large amount, in that case they have no complaint of this kind.

6325. You are of opinion that you could take this step without at all affecting the value of the rupee?—Yes, we can take it, certainly.

6326. Finally, I understand as regards your proposals that you are in favour of the Imperial Bank managing the remittance operations?—Yes, Sir.

6327. You desire to see the control and management of the note issue and the currency policy in the Imperial Bank, but before doing that the directorate of the bank should be made fully representative of Indian interests. Will you explain those requirements as to the directorate of the bank, to show us more exactly what your Association would consider an esential condition?—The Indian interests will be represented more in the official department.

6328. You have not elaborated yet any scheme for a fresh constitution for the bank?—No.

6329. Then, finally, you pronounce against the small note; you say public sentiment is decidedly against its re-issue. That, I may say, is not in accordance with a good deal of evidence we have had here as regards the acceptability of the small paper note, so perhaps you could give us the benefit of your experience on that point?—You see, these notes are spoiled and our country is agricultural. They keep this paper with them, they have to work in water and that is spoiled easily and thousands of rupees are wasted in that way.

6330. You have heard complaints, have you, from small people that they have lost money by destruction?—We see it by experience.

6331. (*Chairman.*) Now perhaps you will be kind enough to answer any supplementary questions that my colleagues may have to ask you. I should perhaps remind the Commission that we have the advantage of the presence of the representatives of the Marwari Chamber of Commerce only until 12.30, and that after that another witness is coming.

6332. (*Sir Norcot Warren.*) Clause 24. Am I to understand from the opinion expressed in this clause that the Imperial Bank of India has the confidence of the people of India to a greater extent than the Government of India? Is that what you mean?—My meaning is that Government has to think more of politics, and this is a currency matter and so this should remain with other parties who have nothing of politics in their minds. It is in this respect that I want to say that this should be transferred to the Imperial Bank. I have no other meaning than this.

6333. (*Sir Purshotamdas Thakurdas.*) Will you refer to paragraph II of the printed memorandum, Mr. Joshi? You say: "The Committee feel sure that if the gold price of the rupee is fixed as suggested and gold is made freely convertible into notes or sovereigns, an immense amount of gold which the country has taken in at 1s. 6d. will be released and will become available for trade purposes." What do you mean by "an immense amount of gold which the country has taken in at 1s. 6d. will be released"?—Now, you see during the last year the country has taken an enormous amount of gold in adjustment of the favourable trade balance of the country. Now, India buys gold at cheaper rates. They only buy gold or silver when they have the level cheaper, and so, they have bought at 1s. 6d., and at 1s. 4d. they will give it back.

6334. What difference will 1s. 6d. and 1s. 4d. make in the rupee rates of gold, Mr. Joshi?—In the rupee rates there will be three rupees difference.

6335. At 1s. 6d. the gold rate is what?—The gold rate is Rs. 21-4, and at 1s. 4d. it will be say Rs. 24.

6336. What you mean is that the people will be making a profit on what they have bought and that they will part with the gold?—Yes.

6337. You mean they will sell it in the market or offer it to the mint to be coined?—They will offer it to the mint.

6338. So, all this gold which at present is in hoard will be converted into coin and will be available for circulation?—Yes, certainly.

6339. Are you saying this from any previous experience of your Chamber regarding fluctuations in gold rates?—Yes, Sir, we have seen.

6340. Will you give us one, if you remember any case like this?—Yes, Sir. Some years back, when the Government gave gold in tender, the price was about Rs. 20 average. Now India bought that gold at Rs. 21 and Rs. 20, and when the trade balance was against India, the price of gold rose to Rs. 33. During that period India was letting gold out. This is a recent experience which I have given.

6341. You mean the people who put in the gold at Rs. 20 sold it back as they made a profit at Rs. 33. Is that what you mean?—Certainly. They sold and got some profit.

6342. You said just now that people buy whichever of the two precious metals is cheaper. What do you think is a cheap price for silver in the eyes of the people with whom you are acquainted, I mean the class about whom you spoke?—It would be regarded as a cheap level of price for silver only up to Rs. 60.

6343. At Rs. 60 you would consider it cheap?—Yes.

6344. And you think that the 72 or 71 rupee rate prevailing at present is on the high side?—not attractive to the buyer?—No, it is not attractive to the buyer.

6345. Gold, you think, at about Rs. 21 is regarded by the people as cheap?—Yes.

6346. Now, if silver happens to go under Rs. 60, you think people will put in silver?—Certainly.

6347. They won't part with it at any rate?—Certainly.

6348. That is the experience of your Association?—Certainly.

6349. Can you give us any instance, if you remember anything, as to when silver was under 60 or at 60?—Some years back.

6350. Can you tell us how many years back?—I don't remember exactly. It was Rs. 56 and India bought an immense amount of silver at that rate.

6351. So you think that if silver goes under Rs. 60 against the Rs. 71 which is the rate to-day, the people will not only not part with silver in their possession but may buy more?—Yes, Sir.

6352. Why do the people buy silver? Supposing silver coin is made a limited legal tender, as you yourself suggest, why would people buy silver at Rs. 56 or Rs. 60?—The price of silver is less than that of the rupee. They buy silver at the market rate, that is the current rate. They buy it at the current rate.

6353. Why do people buy silver? Do they use it for domestic purposes and ornaments?—They use it for ornaments.

6354. And at under Rs. 60 the people feel that it is a very good investment and the lower it goes below the Rs. 60 level, the more people will buy. At any rate they are not likely to sell?—Yes.

6355. Why do you then say that the Government of India, when they make their rupee coin a limited legal tender, should not sell their silver in the market here. Let me explain it. When the Government of India make the silver coin a limited legal tender and as the silver coin which the Government of India would be limiting would be in the neighbourhood of say two hundred crores returning from currency, why should they keep that silver and lose interest on it and why don't you recommend them to sell the silver in the market in India?—The thing is that India is a poor country, she requires subsidiary coins also. So in the shape of subsidiary coin we may keep that silver.

6356. Do you, Mr. Joshi, wish to say that you require rupees as subsidiary coin to the extent of 200 crores? You could not require that, could you? I mean when gold is in circulation and gold notes will be exchanged, as you say in paragraph 11, surely the people would not want so many hundred crores of rupees as subsidiary coin? The Government of India

would have the silver lying in their treasury useless. Why should they not sell it?—Our belief is that so many rupees will not be returned to our currency department.

6357. Now, I will shift to that. How many rupees do you think are likely to be returned when the gold coin is put into circulation?—Not so much.

6358. How much? "So much" gives us no idea. A hundred crores, two hundred crores, fifty crores?—A negligible amount.

6359. Ten crores?—Yes, it may be 10 crores.

6360. I mean, when the people can get gold coin in return for a certain amount of rupees, in accordance with the rate of exchange fixed, you don't think the people will rush for gold coin?—You see, we are not going to convert it into gold at the very beginning.

6361. But eventually when you do convert, the Government of India are bound to have a large quantity of silver rupees in their treasury which you want the Government to place in the reserve. You want the amount to buy gold with. Well to pay for that gold from England or America, they will have to put up money. Now, if they are to lock up their silver rupees here without selling it, surely it will mean less interest to the treasury and to the tax-payer?—We see that we are not going to have it all at once but as the stages come on this silver will be absorbed in the country.

6362. By?—Will be absorbed as it has been for the last few years.

6363. As currency?—As currency also.

6364. But the currency, Mr. Joshi, will then be a subsidiary coin within a period of five or ten years, whatever you may estimate it will take to complete the stages, your rupee will be a subsidiary coin?—Certainly.

6365. And you don't mean to say that as subsidiary coin the country will want the same amount of rupees as they wanted for the main coin?—I don't think there will be any harm if the present amount remains.

6366. (*Chairman.*) Sir Purshotamdas, this is rather the ground that the witness went over with me. Do you think you will get anything more from him by your questions?

6367. (*Sir Purshotamdas Thakurdas.*) I was only wondering whether he appreciated the difference in the shape of loss of interest to the treasury.

6368. (*Chairman.*) I was waiting to see whether Mr. Joshi had anything to add to that. It seems to me he has given us his views upon the matter.

6369. (*Sir Purshotamdas Thakurdas.*) Regarding banking facilities, the people of India especially in the mofussil—I mean the districts—are not accustomed to invest their savings?—Certainly.

6370. The representatives of your community and members of your Chamber have the reputation of being bankers in the districts?—Certainly.

6371. Why do you think that the people prefer to keep their savings in coin or in precious metals instead of offering it as deposits to banks or to industries or to firms like those of your firms?—My reply is that there are not so much facilities, banking facilities, and so they feel disgusted, and so they keep gold or silver.

6372. But while there are no banks, surely there are bankers?—Certainly.

6373. I mean every place has a Sowcar. Why don't people lend to the Sowcar and earn interest instead of keeping it in precious metals?—The system is not so good.

6374. Which system is not good?—The banking system. What I mean to say is that they keep gold or silver simply because they think that when required they will be able to get it; so if facilities may be given by the Imperial Bank, or the currency authorities, then in that case they may do away with gold and take notes.

6375. "When facilities are given by the Imperial Bank," you mean thereby that when the Imperial Bank has a branch and is prepared to borrow, then the people will be prepared to lend?—Certainly, and when there may be some facilities.

6376. What sort of facilities?—According to our Deshi system. Now everything is in English, which some people cannot read.

6377. You mean when banks are conducted with vernaculars as the languago of the district for cheques? Are there none such at present?—I do not think so.

6378. Well, you said that the people generally do not lend and they keep their money in precious metals because they are not sure that they will get precious metals?—They will do it in small amounts owing to want of facilities.

6379. If they feel sure that they would get the gold coin just as they feel sure that they would get the silver coin, you think people would be more disposed to invest?—Yes, more disposed to part with the hoarded gold.

6380. And what would they then do? Invest their money in the Banks, taking it for granted that the Banks will within that period be prepared to give facilities?—Certainly.

6381. Just one more question, Mr. Joshi. You say in paragraph 5 of your written statement: "These effects of a rising or falling rupee are comparatively speaking temporary"; and I understood you to say in reply to the Chairman that in your opinion prices had adjusted themselves since the rise of the rupee from 1s. 4d. to 1s. 6d. The prices of what commodities had you in mind?—The prices of raw materials.

6382. You think the price of bajra and so forth is affected by exchange?—Such things are not exported. "Prices of exportable articles," that is my meaning.

6383. You think that the price of wheat is affected?—If wheat is exported in large amounts, then it is affected to a certain extent, but the poorer population here are using other articles than wheat.

6384. That is, rice, pulses, etc. Did the prices of these articles go down with the rise in exchange from 1s. 4d. to 1s. 6d.—bajra and such other things, not exported?—They were not affected.

6385. Therefore a change in exchange does not affect these articles?—Certainly.

6386. And there are no corresponding sympathetic fluctuations upwards or downwards?—Certainly.

6387. Are these articles the main articles which go to make up the cost of living of the masses in India? Certainly.

6388. Does a rise or fall in exchange therefore cheapen their cost of living?—It has no effect at all.

6389. Whatever the cost of living is, it is stationary, and the gain or loss to tho cultivator in the articles which he grows for export is affected independent of that?—Yes.

6390. (*Sir Reginald Mant.*) Mr. Joshi, to pursue that last point a little further: is there any competition in this country between the different kinds of food grains? I mean, supposing wheat is cheaper, don't people then eat more wheat, and supposing wheat is dearer, don't they eat less wheat?—You see, the masses are only eating such things as bajra and all these other articles because they are accustomed to eat that, and if wheat is cheaper, then they may take that to a certain extent. They are accustomed to eat all these materials which are not exported generally. The people in this part, the massos, are only taking the materials which are not exported in large amounts.

6391. You are aware that in Upper India, in the Punjab, in the United Provinces and in Sind there is a very general consumption of wheat, especially when it is cheap. Are you not aware of that?—You see there are people who are accustomed to it; there are such people also who do not like to eat wheat, in certain parts. They say, "No, we don't like this, we like our bajra, and so on; it is our hereditary food," and so they take it.

6392. That is in this part of the country?—But the richer people, they take wheat.

6393. You are not then acquainted with the conditions in Upper India, the Punjab and the

United Provinces and Sind, where a great number of people consume wheat, not only the rich people?—I think the majority will be found to use these other materials. I do not say that none is taking wheat; there may be some who take it; but taking all into consideration we say that the number will remain below that which takes the other materials.

6394. What I want to put to you is that at any rate in large parts of India the people eat more wheat when it is cheap than they do when it is dear. Do you agree to that proposition?—You see, wheat will not take the place of the other things. They may take it, but it will not totally take the place of the other things. Wheat, if it is cheaper, will not take the place of all the other materials.

6395. Let us keep to one point at a time. You agree that they eat more wheat when it is cheap. Don't you think therefore that they eat less of the other grains? When they eat more wheat, don't they eat less of the other grains?—In that case they may take less of the other grains.

6396. And would not that tend to cheapen the other grains if there is a small demand for them?—I think it is not usually a very big amount.

6397. But there would be some effect from a decrease in consumption?—Small amounts can have no effect I think. Well, if it is in larger amounts, it may have some effect, but small amounts cannot have any lasting effect.

6398. Have you any idea of the proportion of wheat that is exported as compared with the amount that is produced in India? Would you say that 10 per cent. of the wheat produced in India is exported?—More than 10 per cent. I think.

6399. Can you give me a figure?—I have no figure at present.

6400. I think you will find that a very small proportion of the wheat is exported. You say that it is only small amounts that are consumed. I think, however, you will find that a very large amount; by far the greatest proportion of the wheat produced in the country is consumed in the country?—But that is consumed by the rich people, not by the poorer people.

6401. I think you are generalising from your experience in this part of the country, Mr. Joshi?—Well, the general belief is this, that in India the poor masses are taking other materials than wheat. That is the general belief I think, and the rich people are taking wheat. There are two kinds of people: the poor are taking other materials and the rich are taking wheat.

6402. I can inform you, if you are not aware of it, that in the parts of India which I know, especially the Punjab, the consumption of wheat is very general and is not confined to the richer classes?—It may be in certain parts.

6403. Well, taking the parts where wheat is generally consumed, we reach the point that when wheat is cheaper, the consumption increases and the consumption of other grains which are in competition with it decreases. The question I wanted to put to you, and to which I have not yet had an answer, was,—will not that decrease in the consumption of the other grains cheapen those grains, or will it not tend to cheapen those grains?—They may be cheap if greater use is made of the other thing.

6404. And therefore will not the price of wheat affect the price of those other food grains?—I do not think it is so important, because generally, even in times of big exports of wheat or less exports, we do not see so much difference I think.

6405. I do not follow you. The point is that the price of wheat affects the prices of other grains. You will admit that it has some effect?—Some effect.

6406. But your point is it has not an important effect?—Not so important.

6407. (*Sir Henry Strakosch.*) In paragraph 19 of your memorandum, you say that the gold reserve to be provided for when the full gold standard is put into operation will have to be very much bigger than the present gold reserve. You say that you cannot state now what the size of that reserve would be. What I want to ask you is how would you suggest that this gold reserve is to be provided?—This gold reserve will be provided by our favourable trade balances every year.

6408. But how would that work? The reserve would have to be held by the currency authority and how would the currency authority become possessed of that balance of payments which is imported in the form of gold?—They may buy gold by tenders.

6409. Who would buy?—Government, when they fix some ratio.

6410. And in what form will they make payment?—They will make payment in notes.

6411. So you would be increasing your note circulation in order to buy gold?—What I mean to say is that we would issue fresh currency only against gold. We are not buying further silver now.

6412. Yes; I want to know how that reserve is going to be accumulated. You say that gold would come into the country because India has a favourable balance of payments and that that gold would be purchased by the Government and that the people, the sellers of the gold, would accept notes for that?—Certainly.

6413. But if by any chance they were not prepared to accept notes but were to demand that the notes should be converted into gold and you provide for it here by saying "that the reserve would be required to provide for maintaining the convertibility into sovereigns of notes and of rupees in circulation." Well, how would that work then?—It is not in the initial stage. What I want to say is that is our idea; ultimately.

6414. But if you offer to exchange, to give gold for rupee notes and rupee coins in circulation, you must have some gold; you must have gold ready to give it in exchange for them?—No; we are not giving it in the very beginning.

6415. But I am thinking of later on?—Later on when we have enough reserve; that will come along afterwards.

6416. But I have tried to point out to you that it is conceivable that the people will not be prepared to sell the gold for notes?—When our trade balances are favourable, people take gold and the extra, what remains in the market, goes to the currency, if some ratio is fixed.

6417. No, but last year, India imported something like 70 crores of gold. That gold was imported and is now being held by the people in their own stores. Why should they not continue to do that in future?—They are holding it simply because Government is not accepting it.

6418. You think that, if Government were to accept gold, they would then be content to have notes?—Certainly.

6419. And you think that by that process you could, in course of time, accumulate sufficient reserve to be able to pay out gold in exchange for notes and rupees if the necessity arose?—Certainly. But that depends upon the ratio. If the ratio is fixed lower we will get more gold.

6420. I do not understand that. Why would you get more gold if the ratio is fixed lower?—I believe India is buying gold in amounts of rupees. Suppose at 1s. 6d. the price is Rs. 21-4; at 1s. 4d. ratio, it will be Rs. 24.

6421. You mean, in other words, that when gold has appreciated in terms of rupees, the people will want to take a profit on the gold which they bought at a cheaper price?—The country is habituated to believe that gold below 1s. 4d. is never to be maintained.

6422. Therefore, as I say, if the ratio was fixed at 1s. 4d., they would then say that the price will be maintained and therefore there is no longer any prospective profit in our holding the gold and therefore we shall sell it. That is the point?—If

the price goes above and they are sure that they will be able to get gold against it, in that case they will part with it. When there is free gold they will part with it gradually.

6423. Do you think that much gold has been bought recently simply in anticipation of the rate being reduced to 1s. 4d.?—India is in the habit of buying precious metals owing to cheaper rates.

6424. Quite. That is to say, they consider that gold is cheap because they were expecting that the price of gold would rise, which would happen when the ratio is fixed at 1s. 4d.?—Yes. They are of mind that 1s. 4d. is the ratio for ever; that is, our gold is at Rs. 24. This is the belief in the general public, and therefore they don't let gold out.

6425. Therefore, I suppose, it is fair to say that it is the desire of every one who holds gold that the ratio should be fixed at 1s. 4d. rather than at 1s. 6d.?—Not only of those, but the country as a whole wants it to be fixed at 1s. 4d.

6426. (*Sir Reginald Mant.*) Mr. Joshi, I have now obtained the figures for the production and export of wheat the point which we were just now discussing and I should like to call your attention to this: During the last three years for which we have statistics, 1921-22, 1922-23 and 1923-24, the average production of wheat was estimated at 9,850,000 tons and the average export was 313,000 tons; that is a little over three per cent. of the total production. Would you, therefore, now agree that the greater part of the wheat crop produced in India is consumed in the country and that it is not produced mainly for export?—(*Mr Baid.*) My friend is a bullion dealer and I am a wheat dealer; so may I explain it? If we take the average for about 10 or 15 years, the average is about 10 per cent. and not 3 per cent. For three years, of course, it may be less. Last year it was more than 10 per cent. It was 12 per cent. That is for 1923-24, when 12 lakhs of tons were exported.

6427. In 1923-24, the production was 9,747,000 tons and the export was 638,000 tons.—If you take the average for the last 10 or 15 years, I have not got the figures before me here and I can send you afterwards if you want, if you take the average for 15 years, then it will be not less than 10 per cent.

6428. 10 per cent. is the figure I suggested. It was what I had in my mind from my previous experience. But your friend, Mr. Joshi, said that 10 per cent. was much too small and that the export was more than 10 per cent.—10 per cent.

6429. It merely bears out the point which I wish to make that the greater part or 90 per cent. at least of the wheat crop is consumed in India.—About 90 per cent. is consumed and 10 per cent. is exported. But generally the prices of javari and bajri and other pulses are cheaper than the prices of wheat. Even supposing the prices of wheat go a little down, it is very seldom that they go below the prices of javari and bajri and therefore, the poor people generally consume those articles only. While the middle and upper classes consume wheat.

6430. Are you acquainted with conditions in the Punjab, Mr. Baid?—Yes; I know.

6431. Do you tell me that the people generally there do not consume wheat?—In the Punjab the people consume *makka*.

6432. I did not say that they consume nothing but wheat.—I do not say that they do not consume wheat. But what I say is that the farmers generally prefer *makka* to wheat, because that is a much stronger element.

6433. (*Sir Maneekji Dadabhoy.*) In paragrapj 24, Mr. Joshi, you deal with the question of the transfer of management of currency to the Imperial Bank of India. You recommend to transfer the control and management not only of the note issue but of the whole of the currency department to the Imperial Bank. Now it is not perfectly clear whether in this scheme of transfer you want the Government of India to keep some power of superintendence, control and direction?—The Government of India may have some control.

6434. And you would maintain in the Government of India power of superintendence and control?—It will be called the State Bank and it will do as Government are doing at present. All the currency department will be under this Imperial Bank.

6435. The Imperial Bank will be acting as agent of the Government of India?—Yes; it will be acting as an agent.

6436. Now you said that the Bank must be made fully representative of Indian interests. Is the Imperial Bank of India to-day not representative of Indian interests?—I do not think it is fully representative.

6437. (*Sir Maneckji Dadabhoy.*) What recommendations would you make in that direction, I mean what further recommendations?

6438. (*Chairman.*) When I asked the witness that question he said his Association had not worked out any detailed scheme for the change of constitution.

6439. (*Sir Maneckji Dadabhoy.*) You have no personal suggestions to offer?—(*Mr. Joshi.*) No, I am not an expert in this matter.

6440. Would you ask the Government to nominate the directors or would you ask the Bank to nominate the directors?—The Bank.

6441. Government should have no voice in the constitution of the directorate?—Government should nominate certain directors no doubt.

6442. Certain directors should be nominated by Government?—Yes, Sir.

6443. (*Mr. Preston.*) Mr. Joshi, in paragraph 17, you say, "Under the circumstances my committee suggest that effective steps should be taken immediately to ensure India's going over to the full and real gold standard at an early date." That is you do not anticipate that the country is in a position actually to go on to the real gold standard: although you think we should announce that as our ultimate intention, still you are prepared to give the scheme time before it actually comes into operation?—But preliminary steps should be taken.

6444. Exactly. Then in paragraph 21, you say, "My Committee, however, are of opinion that before imposing a limit on the amount for which the rupee should be legal tender it should not be declared convertible into gold for internal use"?—Certainly.

6445. "But whether the rupee remains unlimited tender as now or not for *bonâ fide* export purposes gold should certainly be issued against rupees." Then in your paper you go on to describe or to deal with certain component parts of such a system as you desire to attain. A question was put to you by Sir Henry Strakosch. That was in reference to the gold standard reserve. When Sir Henry asked you how you were going to increase this reserve you stated that the reserve will have to be considerably added to. I take it that your reply did not refer particularly to the gold standard reserve as it exists to-day, that what you were trying to emphasise was the general gold reserves of the country rather than any one particular reserve. Is that right?—We want you to take early steps; these are the early steps to be taken; but ultimately we require a gold standard.

6446. You are speaking of the general gold reserves or the total gold resrves. I take it you intend that Government will not sell more than tho fixed amount of councils which the Home Charges necessitate?—I do not understand clearly.

6447. Well, I will put it in this way. Government under your scheme are only permitted to sell the actual amount of exchange required by their home requirements, nothing more?—Certainly, Sir.

6448. Then they stop and a line is drawn; and as additional currency is required in this country for seasonal purposes every Bank desiring to obtain additional currency, every buyer of India's produce

who desires on his own personal behalf to obtain additional currency, what they will have to do is to tender actual gold in London or ship gold to this country and tender it to the Currency Office and there obtain local currency, either notes or rupees, from the Currency Office?—Certainly.

6449. And the gold reserves to that extent will be increased. I think that is what you really meant?—Yes.

6450. There are just one or two more points I want to ask you. You suggest that we should really, if we coin at all, coin sovereigns and half-sovereigns, or if the country considers that a gold mohur is more to their dignity they can call it a gold mohur, but really speaking it will be a sovereign only under another name?—Certainly.

6451. Of identical fineness and identical weight with our present gold sovereign and half-sovereign, though it may be called a gold mohur?—Certainly.

6452. There is one point in connection with that particular gold standard reserve as it exists to-day. You are, no doubt, aware that the gold standard reserve as it exists to-day, this particular one came into being 20 years ago?—Certainly.

6453. It came into being as the result of profits on the coinage of rupee; the actual profits, I believe, really represented a sterling amount equal to about 27 million sterling. The fund to-day amounts to 40 million sterling. Therefore the increase in that reserve has been brought about by accumulations of interest on that reserve. Now the interest on that reserve to-day, which amounts to nearly a million and a half sterling and which some years ago was always added to the parent reserve, is being used for revenue purposes?—Certainly.

6454. What would you say to a suggestion to this effect, that the million and a half or the annual interest as earned on that fund to-day shall in future, instead of being added in London, the gold should be taken from London and shipped to this side in order to create an additional actual gold fund here in India?—To import gold into India?

6455. Yes?—Certainly.

6456. Then as regards the paper currency, I just want to ask you a question on that. You have stated as your opinion that when we do come to a gold standard the actual gold backing of the note issue should be not less than 50 per cent.?—Yes, Sir; but it is our ideal only.

6457. You have got to arrive at some ideal, of course?—It may be less, but that is our ideal.

6458. We have got to have some figure. Now I want you to give me some idea, an approximate idea, an ideal it may be in the same sense in which you have just spoken, as to how long you are going to give us to bring such a scheme into operation. Would you consider 20 years too long to do this in? That is, to accumulate sufficient gold so that we can say, "Here you are; we have so much good in the reserve"?—It won't take so many years, less than 20 years; I should say 10 years.

6459. But you must give us some leverage; say 10 to 15 years, shall we say? You cannot say exactly how many years it will take. You might meet with one or two bad monsoons, and that would impede the whole of our progress; so really speaking you must have a time-limit to bring this into being; shall we say 15 years?—No, I think 10 years will do.

6460. You think we might do it in 10 years. Very well. However, I take it you will be perfectly content if from the time it is announced that we shall bring this scheme into being; and you recognise that there are difficulties in the way in the meantime which will hardly enable us to bring it actually in force as a working scheme at an earlier period than 10 years from now. That is your idea?—Certainly.

6461. (*Sir Alexander Murray.*) Mr. Joshi, in the statement here, paragraph 7, you say that a low exchange means higher prices to the consumer. Speaking generally, lower exchange means higher prices to the consumer?—Certainly.

6462. And, conversely, high exchange means lower prices?—Certainly.

6463. But in reply to some member you said that that did not apply to particular things and in particular you instanced foodgrains?—Certainly.

6464. And you differentiated between foodgrains that were being exported and foodgrains that were not being exported; and I think you indicated that the prices of the one might be going up without affecting the prices of the other?—Certainly.

6465. And I think you went further and said that as a matter of fact although exchange had gone up prices of certain foodgrains in the country have not gone down?—Certainly.

6466. In particular the prices of purely country foodgrains had not gone down so much as the exportable foodgrains?—Certainly.

6467. Now it is very difficult to get figures to make a comparison but I suppose you know the Labour Gazette and the figures that they make up there. While you have been giving your evidence I have been taking down some figures here on which I would like your opinion. Take four foodgrains in particular, two that are exportable and two that are usually never exported. Take rice, wheat, jowari and bajri. These are four typical grains. Well, according to the figures here, taking the price of rice—you know about index figures, you appreciate index figures, that is, you take 100 as an index and put against it any rise or fall from the 100; taking the figures for July 1914 if we put rice at 100 the index figure for rice to-day is 129, which means that rice has gone up 29 points. Taking wheat the index figure is 124 which means that wheat has gone up 24 points. Taking jowari, the index figure has gone up 28 points, and bajri has gone from 100 to 130, an increase of 30 points. So that there we find over the 11 years from July 1914 to October 1925 the rise has been relatively the same in rice and wheat and jowari and bajri, although two of them are exportable grains and two of them are not generally exportable?—Certainly.

6468. Similarly if you turn to page 130 of this publication you will find the actual prices given, per paylee. They give the actual prices of the rice, wheat, bajri and jowari and as a matter of fact they show very very little change relatively over the 11 years. So that I think as a general proposition in the face of these figures it would be fair to assume that the prices of foodgrains react on each other, that is to say, if one set of foodgrains goes up the other set sooner or later also goes up and *vice versâ*. I have here taken four sets, two exportable and two non-exportable, and they are the biggest cereals in the country; so that I think that you would accept my proposition that they rise and fall together more or less?—No.

6469. I think you say that foodgrain prices in India have not gone down in proportion to other things?—They have not come down.

6470. As a matter of fact, if you turn to page 127 of this publication they give here the statistics for food, non food and general wholesale prices—three different things; and it shows that in 1920-21 the index number for food articles was 206, while to-day it is 157, that is, a drop of 49 points. The non-food index number in 1920 was 219; to-day it is 169 or a drop of 50 points; and of all the articles put together, the wholesale articles, the number has dropped from 216 in 1920 to 165 now, or a drop of 51 points. Now it is an extraordinary coincidence that food, non-food and other articles have more or less all dropped 50 points since 1920 and exchange has been steadily rising since 1921; so that again it would be a natural conclusion to assume that with a rise in exchange, on the figures I am giving, the prices have come down?—Not in all cases.

6471. But I am giving you three sets of figures for food, non-food and all articles?—There may be some other causes relating to demand and supply which may affect the prices.

6472. Quite true; I agree that in particular cases or with particular articles there may be other causes; but I am giving you figures for these three sets of things over a period of six years; that would go to point out that with a rise in exchange you get a fall in prices. Again at page 204 the figures of retail food index numbers for India are given as against other countries. Now these are retail food index numbers alone and they are not included in the other articles; and they show that taking it since October of last year, when the exchange was 1s. 4d. (and to-day it is 1s. 6d.) the price of food articles has dropped from 156 to 148, again bearing out to a certain extent the fact that with a rising exchange there is a fall in prices?—Yes.

6473. Now, turning to paragraph 12 of your statement you say "Trade is slacker than even in the almost bankrupt States of Europe. . . . Neither imports nor Indian manufactures are finding a good market"?—Yes.

6474. But, as a matter of fact, the trade turn-over for India if you take imports and exports together, is the biggest that has ever been in the history of India; the amount is 650 crores together?—That may be so; but from practical experience we see that there is no business at all, that all are complaining that nobody is able to make any profit.

6475. You are talking as a trading community and Marwaris are all traders, and you make a statement that neither imports nor Indian manufactures are finding a good market?—Yes.

6476. While as a matter of fact the trade of India, the export and import trade, which is a fair index of the Indian trade, is bigger than it ever has been?—I do not mean the import and export trade; but the internal condition of trade in India.

6477. But the import and export trade is a fair index of what is going on in India as a whole? It is a very large proportion?—But I do not think it has given any profit to the people.

6478. What do you mean by that?—They are not earning any profits and so trading is slack. Things are not saleable.

6479. Are you thinking of any particular article? Name one article?—Cotton cloth for example.

6480. Let us take cotton cloth; you say they are buying dear and are not able to sell at a profit. Naturally if you are on a falling market and if you buy at a high price and the market has dropped, you cannot sell at a profit. If you will take the figures either of cotton manufactures or of raw cotton you will find that prices have been falling for the last year or two, so that you cannot possibly expect to buy and sell at a profit because there has been a fall in price. If you take the United States of America for instance, in 1923 the price of cotton was at 21 cents; in 1924 it was 35 cents and to-day it is 18 cents; if you take the price of cotton in Liverpool, in 1923 it was 21d. to-day it is 9d. When you take cotton it is natural that you should be buying dearer and selling lower and not making a profit; but you say that the Indian trade is very badly affected due to this difference in exchange. I have shown here that the difference in cotton is due to the fall in cotton prices largely; but over and above that how can you expect the imports of cotton to be as large to-day as they were in the pre-war days, when you find mills producing in India very much more than they ever did in pre-war days? While you have been giving evidence I have been taking out some figures and I see, for instance, that it is given there that in the five pre-war years the imports of cotton piece-goods into India averaged 2,632 million yards; and in 1923-24 they averaged only 1,485 million yards. Now that is a decrease of 44 per cent. You would argue from that as a Marwari trader and representing an Association that trade was very bad and therefore exchange or something else is to blame. Well, now taking the production of the Indian mills on the other hand, in the five pre-war years the Indian mills only produced 1,105 million yards per annum; but if you take 1923-24 they produced 1,700 million yards, an increase of 54 per cent. Now, on the face of that you will say the Indian mills must be doing very well, because they had increased their output from a pre-war average of 1,105 million yards to the present average of 1,700 million yards?—It does not mean that the trade is good.

6481. (*Chairman.*) Sir Alexander, I do not want to interrupt you, but I wonder if either of the witnesses has got any personal experience of the cotton trade.

6482. (*Sir Alexander Murray.*) They are big cotton importers, are they not? They represent a cotton importers' association and they instanced cotton cloth in reply to one of my questions; that is why I went on questioning them about cotton.

6483. (*Chairman.*) Does your association include brokers, dealers and merchants in the cotton trade?—Yes.

6484. (*Sir Alexander Murray.*) What remark have you to make on the figures I have given?—My remark is that the figure of production is not a proper indication of progress. We can see that so many cotton mills have made no profit at all. The number of mills has increased and it is therefore that the production has increased.

6485. You say the trouble is that the number of mills has increased and the production has increased in consequence?—Yes.

6486. Now, dealing with one other thing, you say if the Government select a higher ratio than 1s. 4d. it would break down in times of extremely adverse balance of trade: now how many extremely adverse balance of trade years have we had, in your experience? Can you point to any in the past thirteen years?—It broke down when it was 2s. It went down to 1s. 3d.

6487. That was the war?—After the war.

6488. Those were abnormal times and that only lasted for eighteen months or so. But taking the pre-war years how many extremely adverse balance of trade years do you know of?—1907 and 1908.

6489. There was an extremely adverse balance of trade in 1908; can you refer to any other year previous to 1914 in which there was an adverse balance of trade?—I do not remember.

6490. And can you point to any other years since 1922 when there has been an adverse balance of trade?—I cannot say.

6491. Therefore is it not a bit unreasonable to legislate for adverse balance of trade when that only occurs once in twenty years?—I don't know exactly. But we think that if the ratio is fixed above 1s. 4d., it is not maintainable in all cases. That is the opinion my committee has formed.

6492. (*Sir Alexander Murray.*) You use the expression "in times of extremely adverse balance of trade." Thank you.

6493. (*Sir Purshotamdas Thakurdas.*) Don't you think, Sir, it will be useful to have on record the particular line of business with which Mr. Joshi himself is personally acquainted and with which Mr. Baid is himself acquainted.

6494. (*Chairman.*) Mr. Joshi, your line of business is a bullion dealer, and Mr. Baid, you are principally concerned with grain and cotton?—(Both) Yes.

6495. (*Sir Purshotamdas Thakurdas.*) Then, Sir, may I ask him one question? Then the replies you have given here regarding the price of foodgrains are not based on your personal knowledge at all, Mr. Joshi?—No, not at all.

6496. (*Chairman.*) Sir Purshotamdas, these witnesses have come to represent the opinions of their chamber. We must not unduly discount their evidence in that respect, must we?

6497. (*Sir Purshotamdas Thakurdas.*) It is a question, Sir, of degree. I wanted to ask him whether he himself was in touch with the business of grain about which he gave certain replies. (*Mr. Baid.*) It was for that reason that two or three witnesses were sent, so that one could supplement the replies of the other.

6498. (*Chairman.*) The Commission is very much obliged to you, gentlemen, for your very full and ample assistance this morning and to your Association for their memorandum.

(*The witnesses withdrew.*)

Mr. CHUNILAL MEHTA called and examined.

6499. (*Chairman.*) Mr. Chunilal Mehta, you are a cotton and bullion broker and a commission agent, and have been engaged in business in the city of Bombay for a number of years?—Yes.

6500. You have been good enough to provide the Commission with a memorandum* of your views upon the currency question. I will, if I may, ask you a few questions. In the first place, as to the scheme which you propose, do you suggest that, before limiting the rupee as legal tender, an opportunity should be given to convert silver rupees into gold?—Yes.

6501. And especially those held as stores of value?—Yes.

6502. To what extent do you think advantage will be taken of that offer?—Well, it will take some time and it will take about 100 crores.

6503. 100 crores spread over some time?—Yes.

6504. Let me put a suggestion to you to ascertain what you think about it. It is this, that as soon as you make the offer you will get the whole of the 100 crores pushed out at once, because people will say: this is a good thing, do not let us be too late for it?—No, they will not do that.

6505. Why not?—People will not hurry. They have got sufficient gold at present. At least in bar gold they have invested in a very big amount, and hence they will not hurry to get the gold coin very soon.

6506. We are considering people with silver now, not people with gold. Do you think the hoarding of silver exists only to a very small extent?—The hoarding of silver is only for ornaments.

6507. We are considering rupees at the present moment, silver rupee hoards?—There may be, but I do not think there will be a run on the gold coin. And even in the beginning it is quite possible there may be a run, but as soon as the public realise that they can get gold coin in exchange for rupees, the run will be lessened.

6508. That is an interesting opinion. How long will it take for people to get confidence that they can get gold coin for the rupee. How much will have to go out before it begins to come back again?—About 50 crores.

6509. Have you estimated what the amount of silver rupees hoarded in the country is?—It is difficult to say. All the rupees coined are about 600 crores. The hoards I have not estimated, but it cannot be more than 150 crores.

6510. And of that 150 crores, you estimate that only about 50 will come in?—About 50. As soon as 50 crores come in and gold coin is circulated to that extent, the public will have full confidence that they will have gold coin.

6511. Would you consider it prudent on the part of the currency authority not to provide against the possibility that the whole 150 crores might be tendered?—No. The giving of the gold coin should not be made obligatory on the part of the Currency Department at the beginning.

6512. You would make it obligatory by steps?—Yes. It should be at the option of the Currency Department to give either the gold or the silver coin.

6513. I suppose as a practical man you would say that the Currency Department should not undertake any obligation more than it has got gold enough to meet from step to step?—Yes.

6514. How do you think that the Currency authority ought to get gold in its reserves in order to undertake these obligations step by step?—Well, my suggestion is that a certain number of rupees should be minted every year and the bullion should be sold off.

6515. You estimate here that in order to get that you would have to melt down 12 crores every year. That is from the currency reserve?—Yes.

6516. And you expect that you would get nine crores by selling that 12 crores?—Yes.

6517. Is not that rather an optimistic estimate?—From what point of view?

6518. That for your 12 crores which you melt down you would realise nine crores in gold?—No, it is not optimistic, because I suggest along with that the prohibition of silver import into India.

6519. Can you give me the price per pence standard ounce on which that estimate is based?—Price of silver?

6520. Yes, at the time of these sales?—I have given Rs. 80 per 100 tolas as the internal price.

6521. You could not convert that into pence per standard ounce?—Yes, I could; on what exchange?

6522. The current rate of exchange, 1s. 6d.?—Yes, about 36 pence.

6523. 36 pence per standard ounce?—36 pence in London at 1s. 6d. exchange.

6524. It is about 33 pence now?—It is below 32.

6525. So that that difference at the higher price represents the duty?—It can be taken as duty.

6526. What percentage of duty are you basing that on?—It depends upon what the London silver market is.

6527. You are taking it at 15 per cent., are you not?—More than that, at 25.

6528. And you do not think it is unduly optimistic to suppose that duty at 15 per cent. would keep the price up to 36 pence per standard ounce, even when you are selling 12 crores of silver a year?—No, my suggestion is that London silver shall decline positively, but our internal price will have no connection with the London price.

6529. That is because of your duty?—Not duty—prohibition I mean.

6530. I see, you would actually prohibit import?—Yes.

6531. What effect will that have socially upon the people? Will that be a popular measure in India?—Well, opinion will remain divided rather.

6532. It might be rather acutely divided, if you keep up the price of silver at that price?—The price of silver has been maintained for many years. It is not a new thing in India—higher prices of silver.

6533. The import duty on silver was not popular, was it?—The thing is whether it was popular or not, the consumption of silver was going on.

6534. What is popular is cheap silver?—No tax is popular in the world.

6535. No, but is not cheap silver? Is it not rather a favourite luxury of the people? Doesn't it create a lot of criticism if the Government keeps the price of silver up?—I don't think so.

6536. You get 12 crores a year: 9 crores from the sale of silver and 3 crores, as you boldly say, from additional taxation?—Yes, I first propose to use the interest of the gold standard in the reserve.

* Appendix No. 31.

6537. If there was any further sum to make up, you would have to make it up from taxation?—Yes, Sir.

6538. To get your 12 crores a year?—Three crores only.

6539. Nine crores from the sale of silver and 3 crores from the interest on the reserve, and if there is anything left over, you will make it up from taxation?—Yes, Sir.

6540. How far will 12 crores a year of gold go in carrying out your proposals?—It will take about ten years.

6541. You think it will take about ten years. That is, you need 120 crores of gold first and last?—Yes.

6542. And that would have cost you, according to your estimate, about 3 crores a year for ten years?—Yes.

6543. At the end of ten years, I understand according to your calculation, it will leave you with no further outstanding expense?—No, no further outstanding expense.

6544. That is based upon two assumptions, that you realise the price of the silver and that the gold is adequate for its purposes. Now, let us see what steps you take. You take no steps I understand, according to your scheme, to put gold into circulation at all?—No, I do.

6545. Do you take any such steps?—Yes, I do.

6546. What is that step?—I have mentioned that it should be put into circulation after two years.

6547. You say, " Gold rupees thus minted should not be issued to the public for circulation for the first two or three years. But after that a beginning should be made to issue every year a certain number of gold rupees to the public, increasing the quantity every year." What would be the effect of that in practice? Will these gold rupees stay in circulation?—In the beginning they may not stay.

6548. Then you will simply be increasing the hoards in the country?—Yes.

6549. The more that was taken out and went into circulation, the less you would have left in your reserves?—We have to keep only a limited amount.

6550. The immediate point is this. We cannot do two things with the coin—let it out in circulation and keep it in reserve against the time when you undertake the definite obligation to give gold rupees in exchange for silver rupees?—That undertaking should be taken after ten years.

6551. Most of your gold will be gone?—I do not mean the whole portion of the gold. A certain percentage should be fixed.

6552. If you succeed in getting in by your scheme 120 crores in ten years, as I understand from your recommendations you keep about 50 crores in your reserve against the evil day, and let about 70 crores out in circulation. What is happening in the meanwhile as regards the ordinary expansion of the currency of the country which requires an increase from year to year?—I cannot follow, Sir.

6553. The currency of the country needs a certain amount of normal expansion. That also implies a nomal expansion of the reserves. How are you going to provide for that without absorbing all the gold for these additional new purposes?—You mean seasonal?

6554. Not seasonal, but the normal expansion from year to year?—I think the present circulation is rather big enough to require any further increase in the coming years: 190 crores are already in circulation, and I do not think within the next five years any substantial increase will be required in the circulation of the note.

6555. That would be a way out of that difficulty. There are one or two of your more detailed provisions which I do not perfectly understand at first sight. No. 5 says: " All future currency notes should be issued with the provision—' Payable either in gold rupees or in silver rupees at the option of the Government,' " and No. 6 says: " All future loans of the Government as well as Public Bodies should be issued with the same provision as mentioned above in No. 5." Your note is to be paid in gold rupees or in silver rupees at the option of the Government; will that be a permanent provision?—No, only during the transition period.

6556. And thereafter your note is to become payable in gold only?—Yes.

6557. Then you recommend that " during the period the present silver rupee value should be fixed at 1s. 6d. gold ": is that again to be a permanent provision?—During the transition period.

6558. After the transition period, what do you recommend?—The exchange value fixed at present should be abolished.

6559. And your gold coin is to be what?—Rs. 20 gold coin, weighing 180 grains troy and having 165 grains fine gold.

6560. That is too hard for one who is not a bullion dealer, but as a matter of fact, taking your gold coin 180 grains troy and 165 grains fine, and that being Rs. 20, what ratio is that to the sovereign's worth of gold?—1s. 6d. it will come to. The melting point of the gold coin will be something below 1s. 5$\frac{1}{2}\frac{3}{2}$d., something below 17$\frac{1}{2}\frac{3}{2}$d.

6561. So you are really keeping on the familiar 1s. 6d. ratio?—Yes.

6562. You have not argued the matter in your memorandum. I understand you are not in favour of a return to the 1s. 4d. ratio?—Well, by trying to return to 1s. 4d. the question of a gold standard will be rather deferred for the present. The transition periods will be two in number:—coming from 1s. 6d. to 1s. 4d., that will be the first transition period; coming to a gold standard will be the second transition period.

6563. Do you desire to express any opinion as to what ought to be done as regards the transition period, as regards maintaining the present rate or bringing it down to 1s. 4d.?—It can be maintained by the methods that have been followed up till now, selling Councils and reverse Councils as required; and when 1s. 6d. is fixed, gold can be tendered to the currency for getting an expansion of the currency circulation.

6564. I think that fills out the picture of your scheme. Let me see whether there are any further questions which I can usefully ask you, in order to elucidate your views. What would be the effect of your scheme upon the importations of gold upon private account?—The importation of gold will be decreased in proportion to the gold coin in circulation.

6565. Why should it decrease?—People generally prefer hoarding or keeping gold coin to liquid or bar gold in the absence of the gold coin. All these years people have been accumulating gold bullion, but as soon as the gold coin is in circulation, the consumption of the bullion will be lessened.

6566. You mean they will get their gold from Government in the form of currency instead of buying it on private account? That would be a rather regrettable thing, because your gold currency will go off into hoards?—It can be used by the public. If a man wants gold bullion for hoarding purposes or anything, he buys a certain amount and keeps it at home. If he wants to exchange, he will have to sell back. The difference between the buying and the selling price of gold is always a big amount, while the coin could be easily put into circulation whenever required.

6567. Do you think that, if you are minting gold in India, gold would come out of the hoards to the mints?—Yes. Gold will come out and be minted.

6568. I rather gathered from your analysis that at first it would go back whence it came until people got confidence, that although having a gold coin would result in bullion being brought to the mint for coinage, that would be only for the convenience and assurance of having it in the form of coin, and that at first, at any rate, you would not look for any reduction in the amount of gold held as stores of value?—I think hoarded gold will come out and circulate more freely when the public gets more confidence that it will be available from the currency office.

6569. The more it goes into circulation, the more expensive it will be to the Government. Regarding these amounts which you limit the Government to put into circulation at first, do you think, even if they do remain in circulation, they won't flow off into hoards? Do you think they will produce any real effect in inspiring confidence that gold is obtainable?—It will do much to inspire confidence.

6570. What I seo is this possible fear. Supposing a very substantial part of that gold did not stay in circulation but went back into hoards, what would you yourself contemplate as a first possibility? The limitation to this amount for a year, which is all that you can contemplate, will mean that there will be so little gold available for circulation that it will not really have those educative influences to which you refer?—I firmly believe that the hoarding habit will be lessened as the confidence is increased day by day and lax money will come out for investment purposes more and more.

6571. There is no difference of opinion about the tendency?—The larger public is day by day getting more educated.

6572. The only question is whether these measures would be so substantial in amount as to have any very appreciable effect in producing that tendency towards further education? It might be put against you by a critic that the amount remaining in circulation would be so small that it would not really have any effect in inspiring confidence?—It cannot be so small. How can it be a small amount?

6573. What do you allow a year?—Twelve crores' worth of gold I propose; that comes to about £10 million a year.

6574. Surely not so much; it is only 7 crores?—But the public knows that there is gold in the currency; that is sufficient.

6575. The public may know that there is some gold there, but they may say that there is not much gold for you and me?—The people, those who are of that idea, are rather more poor; there are some backward classes, but they are poor enough to have no gold.

6576. (*Chairman.*) Are there any supplementary questions to ask Mr. Mehta on his interesting scheme?

6577. (*Mr. Coyajee.*) Might I mention to you, Mr. Mehta, that the name which you propose for your gold coin is rather anomalous and inconsistent, because the rupee means a coin made of "rupa" or silver, and a gold rupee is a rather inconsistent title. Of course it is a little detail, there is nothing in it. A rupee means made of "rupa"; yet it is a coin, and a gold coin and a silver coin are, all tho same, coins; as used in America, for instance there are gold dollars and silver dollars?—In suggesting a name there is nothing very particular about it; any name can be given. That was only my suggestion. The name "mohur" or any other name may be given.

6578. Now are there not two kinds of demand at present for the rupee, one for the rupee as currency and the other to some extent for hoarding? You told the Chairman that about 150 crores of rupees had been hoarded. Similarly there will be two kinds of demands for gold, one for currency gold and the other as a store of value?—Yes; I think that gold has been sufficiently accumulated at present and hoarded and that at least for some years no gold will be required for the purpose of hoarding.

6579. You mean hoarding habit will disappear? Only the banking habit will be largely developed, and that cannot be developed in one or two years, and therefore there will always be a certain amount of currency being diverted into hoards?—Yes.

6580. That being the case, why do you think that the 150 crores of rupees in hoards will not all be brought forward for substitution into gold?—It may be brought forward; but it will not be obligatory for the Government to give gold coin. It is not obligatory in the beginning for the Government to give gold coin. It is at the option of the Government.

6581. But as soon as there is any opportunity for the Government giving gold coin freely, the hoards will come forward?—Yes; but the confidence will be strengthened day by day and the hoarding will be lessened.

6582. Supposing my confidence strengthens; still why should I hoard silver and why should I not get gold for it and hoard it in that form?—Yes; they would change it into gold. That is, I have taken it at 120 crores for purposes of changing.

6583. Then you propose to prohibit the import of silver bullion into India and the imposition of an import duty on silver?—No; I do not mention about the imposition of the duty.

6584. Very well; the prohibition of import. Does not that mean a sort of taxation, a special taxation, on the consumers of silver in India?—It is.

6585. And that means the transfer of some of the burden by bringing in the gold standard?—To the Indian public.

6586. Not to the Indian public in general; but to a special class?—I do not think there is any special class who use silver. Almost all people in India do use silver, either rich or poor.

6587. The rich will use largely?—Yes, they use it much more. All their utensils will be of silver.

6588. (*Sir Alexander Murray.*) During the past four years we have taken on an average 18 crores of rupees worth of silver?—Yes.

6589. Then you propose selling in each year 11 or 12 crores?—Yes; along with that I mention that more rupees should be melted if there is demand. In any case if there is a greater demand than 40,000 bars a year.

6590. You think there will be a demand if we put up the prices so high as 38d.?—There is no question of London prices in India.

6591. It will be an equivalent of that?—No; it has no connection. The internal price of India will be rather arbitrary.

6592. Can you keep India in a water-tight compartment in the matter of price of silver?—You won't be importing from America or China or whatever it is. Therefore there would be in effect the equivalent of 18 crores of rupees of silver thrown on the other markets in the world for sale. Yes; the excess of production in the foreign markets.

6593. Well, that would mean that prices of silver in foreign markets will drop from being 32d. to being probably 22d.?—Not 22; but they will drop.

6594. And you think you will still be able to maintain India in a water-tight compartment by itself with the price of silver normally at about 34d. or 38d. while in the rest of the world it is only 24 or 22?—There was an import duty on silver at one time and the world price was below the Indian price at the time. There was 15 per cent. duty and there was vast difference between the world prices and the Indian prices and India is accustomed to it.

6595. Every time there has been any change made in silver currency?—This is not a change in currency.

6596. But I was going to say, for instance, after the Franco-Prussian war in 1873, the price of silver dropped right away down and you do not think there will be a drop outside India which will cause trouble in India if you force people in India to pay for silver in India, you say they require it for marriage and other purposes, to pay something between 34d. and 38d. for that?—It will not be more than 36.

6597. On the basis of 1s. 6d. But if it comes to 1s. 4d. it will be more?—Something between 34 and 32.

6598. Can you reasonably expect the people in India who are consuming great quantities of silver for religions and other purposes, to be contented to pay prices in India, as I say, equivalent to 36d. when prices elsewhere in the world will be 24d.?—The difference is rather vast. You take 24 and 38. India has been accustomed to pay 15 per cent. duty. That

is an open thing. According to my plan the difference will be about 25 per cent. below 28d.; in the mines the production of silver will be lessened and the world prices of silver, I do not think will go down very much.

6599. It has dropped to 21?—It may drop.

6600. It will drop and you don't think there will be any grievance in the minds of the people of India, rich and poor, against the Government?—That question is rather clear. Government imposed a duty of 15 and what was there? There are always two sides and it is for the sake of India, to give a gold standard.

6601. (*Sir Maneckji Dadabhoy.*) In paragraph 7 you state " During the period present silver rupee value should be fixed at 1s. 6d. Gold." I understand that you want to fix this ratio of 1s. 6d. during the transition period as, otherwise, in your opinion, it would jeopardise the foreign gold standard? That was your argument?—Yes, one of my arguments.

6602. I would like you to develop this argument and make it more clear. The first thing for going from 1s. 6d. to 1s. 4d. is the transition period. To come from 1s. 6d. to 1s. 4d. would require a certain period; it cannot be within one day or one month. Otherwise it will involve heavy losses to the public, the trading public. In other words it means that there would be two transition periods, one for gold standard and one for the other. That is your contention?—Yes.

6603. What do you mean then in the last and final paragraph where you say " Finally, to fix the exchange value of rupee at 18d. or at 16d., or at any other point, without putting into operation the workings of a well-fixed programme for Gold Standard " and so on?—What I mean is at present only gold exchange standard is adopted and any price value of rupee being fixed without trying to go to the gold standard, I don't like. Without putting into operation the working of the gold standard, how to reach to the gold standard?—We should begin that plan now; that is what I want. Without beginning that plan of reaching to gold standard, only to fix the value of the rupee, that I am not in favour of.

6604. What will be the transition period in your estimate for the gold standard?—About ten years.

6605. Supposing during that interval one or two famines take place. Will you be able to maintain the ratio of 1s. 6d.?—It can be maintained.

6606. How?—By selling reverse councils.

6607. Then you would recommend in that case to sell reverse councils and maintain the exchange?—Yes.

6608. (*Sir Henry Strakosch.*) First of all, where you speak about the deficit of 3 crores which will have to be made good, you say that that amount will have to be met by the Government either by revenue or by interest received on the securities in the gold standard and paper currency reserves. You are aware no doubt that the interest received from the securities held in the gold standard reserve go to revenue now; so that it really means that the expense would have to be met by taxation?—Yes.

6609. Then there is one other point. You suggest total prohibition of silver into India. You probably remember the war period when the import of gold was prohibited. Did you hear of any imports of gold while this prohibition was in force? Did not India import rather substantial amounts of gold while the prohibition was in force?—It did because, no silver was available at the time.

6610. Well, if you prohibit the import of silver and the people of India want to have the silver and if the difference of price between the silver outside India and inside India is very big, don't you think that in spite of the prohibition, a great deal of silver will be imported?—How?

6611. Exactly in the same way as gold was imported during the war when there was a prohibition on the import of gold?—This is a question for the Government to enforce their rules and regulations.

6612. But is it physically impossible, if the inducement is big enough, to really prevent?—In the first place I think that the inducement will not be big enough. The highest it will reach is only 25 per cent.

6613. That is a big percentage?—There was a duty of 15 per cent.

6614. Now another point. You suggested that the price of silver to be fixed by Government should be Rs. 80 per 100 tolas. The present price is 72. Now another witness told us that the people of India are in the habit of buying silver freely when the price of silver goes down to Rs. 60 per 100 tolas, and that the purchases of silver as the price rises, diminishes?—I admit.

6615. Do you not anticipate that, if you fix the price of silver at Rs. 80, the people of India would consider silver dear and gold cheap, gold by that time having been fixed at whatever it may be? Would not the logical effect be this: that the people of India would prefer to buy gold rather than silver?—Accordingly I estimated the offtake of Indian silver at only 40,000 bars. It is at present about 75,000. I have made the estimate less because in view of the higher prices the offtake may diminish. I have assumed that and have taken only 40,000 for Indian consumption, instead of 60,000 or 65,000 as at present. But silver is required for purpose that cannot be replaced by gold; certain things which are done with silver must be done with silver and it cannot be replaced by gold even if the gold rate is 18.

6616. But is it not a fact that people have been buying gold so freely because they considered it cheap, in recent years?—Yes, in recent years.

6617. Is not that going to continue and be accentuated if the price of silver is raised to 80?—Not to any extent affecting the consumption of gold.

6618. You do not think so?—No.

6619. (*Sir Reginald Mant.*) Mr. Chunilal, do you intend that your new gold coin of Rs. 20 should be of the same fineness as the present sovereign?—I have mentioned the fineness, shall I work it out?

6620. Yes, I would like you to work it out. It comes to eleven-twelfth fine, the same as the sovereign. The sovereign weighs——?—123 grains, eleven-twelfth fine, the fine gold in the sovereign is 113 grains.

6621. Well, it works out to the same thing?—Approximately.

6622. (*Sir Purshotamdas Thakurdas.*) You attach such importance to India having a well-fixed programme for a gold standard that you think the question of cost to the tax-payer should be regarded as secondary in this connection?—Yes, Sir, I think that.

6623. You in fact put that as the most important question to be solved for India, the way in which to get a well-fixed programme for the gold standard?—Yes.

6624. You also say that India will have to pay a very heavy price for having to go to a gold standard with a gold currency?—Yes, Sir.

6625. Is it your opinion that the longer the delay in going to a gold standard and gold currency the more will be the increase in this heavy price to be paid?—Yes.

6626. Why?—The more rupees in circulation or with Government the more the depreciation.

6627. The greater the stock of token coin the greater is India's loss?—Yes.

6628. And although you realise that a gold currency will entail a higher cost, owing to what you call the people being less educated and less civilised——?—I do not say the heavy price.

6629. But I am reading from your own statement, Mr. Chunilal, on the first page. In spite of realising that it will mean to India a heavy price you think a gold currency is absolutely necessary with a gold standard to inspire confidence in the people in this currency system?—Yes, Sir.

6630. Now you just now told us that you selected 1s. 6d. gold for the purpose of attaining the gold standard earlier. You said that if you suggest any change in the ratio it may delay the gold standard which you are aiming at so anxiously. Yes, Sir. I said that it is one of the arguments that it will delay reaching the gold standard.

6631. That is one of the arguments. Well, supposing you were told that it need not delay the starting of the gold standard programme would you have any other opinion to give regarding the ratio?—Yes, if it is fixed at 1s. 4d. with the same programme for a gold standard it will be more benefit to India.

6632. You would prefer that?—Yes, I would prefer that.

6633. Why do you dislike 1s. 6d.?—Because it is detrimental to Indian agriculture and industry, both.

6634. In your opinion 1s. 6d. is detrimental to both agriculture and industry?—In comparison with 1s. 4d.

6635. Therefore you are prepared to make even this further sacrifice, namely, that the country might also suffer this further loss provided you get your gold standard programme started at once?—Yes, Sir.

6636. You have been a cotton and bullion broker and commission agent?—Yes.

6637. You also have been a bullion broker and commission agent?—Yes, Sir.

6638. As commission agent in cotton, do you deal with up-country or are your activities restricted to Bombay?—Both.

6639. Why do you say 1s. 4d. is preferable in the interests of the country?—Internal prices would then increase and the agriculturists would get more money.

6640. Mr. Mehta, it has been pointed out to us in evidence by those who support 1s. 6d. that the increase in prices by reversion to 1s. 4d. will mean increase in the cost of living and will hit the labouring classes and the middle classes. How do you reconcile that with your opinion that 1s. 4d. is to the interest of the country?—Comparatively 1s. 4d. will not be so detrimental to Indian interest; it won't hit hard the poorer classes.

6641. You said prices will increase; the cost of living will also increase?—Yes, but the income also will increase. The prices realised on the produce will be more.

6642. With 1s. 4d. the income will increase?—With 1s. 6d. the income goes down and the cost of living goes down too.

6642A. Where is the gain?—The gain is in 1s. 4d.

6643. How, if the cost of living increased side by side with the income and if the cost of living goes down side by side with a reduction in income. It is square.—No, the income is rather more than the cost of living goes up.

6644. Will you explain that in greater detail if you will?—Well, supposing the price realised at 1s. 6d. is Rs. 360 per candy of cotton, at 1s. 4d. the cotton price will rise to Rs. 400, approximately, and the labourer or the agriculturist will not require that amount of Rs. 40 as the increase in living cost.

6645. It is contended, Mr. Mehta, that in that case the cost of labour will go up, the cultivator will have to pay his labourer more?—The cost of labour has already gone up.

6646. It may go up further with the cost of living increasing?—The cost of living is already high enough.

6647. You do not think that with the reversion to 1s. 4d. the cost of living will go up?—It would go up no doubt but not to that extent.

6648. To the extent of the extra Rs. 40?—Yes, Sir.

6649. May I then take it that you are of the opinion that 1s. 4d. is desirable and you do not recommend it only because you are very anxious to get a well-fixed programme for a gold standard?—Yes, Sir.

6650. And any amount of taxation should be a secondary consideration in introducing this gold standard?—Yes, Sir.

6651. (*Sir Alexander Murray.*) Mr. Chunilal, in reply to Sir Purshotamdas Thakurdas you said that if the price of cotton was 360 per candy at exchange 1s. 6d. then at 1s. 4d. it would come to Rs. 400. But as a matter of fact the price of cotton is controlled by the price of American cotton?—Yes, that is one of the factors; but exchange is also another factor.

6652. Now exchange has been steadily rising for the past year, or two from 1s. 4d. gold to 1s. 6d. gold. The price of cotton during the past year or two has been steadily dropping?—Yes. The exchange has its effect not only on cotton but on all export articles; but the price of commodities is connected not only with foreign prices but with exchange also. It is not only foreign prices that influence the price of commodities.

6653. The American price of cotton does control the price of cotton in this country.—It is only one of the factors, and it is not the sole factor.

(*Chairman.*) We are very much obliged to you for your attendance here to-day.

(*The witness withdrew.*)

The Honourable Mr. H. S. LAWRENCE, C.S.I., I.C.S., called and examined.

6654. (*Chairman.*) Mr. Lawrence, you are a member of the Indian Civil Service and the Finance Member of the Government of Bombay, a position which you have held for some years now?—Yes.

6655. You have been good enough to furnish the Commission with a memorandum* which sets out some opinions and an analysis of the currency problem. I understand that your evidence to-day will be in your personal capacity and not as a representative of the provincial government?—Entirely; yes.

6656. I would, if I may, ask you a few questions to elucidate the opinions expressed in your memorandum. You make two quotations from the Report of the Royal Commission, of which Sir Austen Chamberlain was Chairman. The first quotation summarises itself in the last sentence that the Government should continue to act on the principle of giving the people the form of currency for which they ask. When I refer to the Report, I find from the context that what the Commission was thinking of there was some form of metallic currency, whether silver or gold?—Yes, I think so.

6657. And that it was not an opinion expressed as to any difference between a gold exchange standard or a gold currency standard?—No, I think not.

6658. In the second quotation which you make the Commission said: "Any attempt to refuse gold to meet these legitimate demands would be unjust and foredoomed to failure and could only cause alarm and instability." When I refer to the Report again, I find that from the context the legitimate demands for the gold in question really refer to what we for short call gold for hoards, and that that was the legitimate demand which the Commission had in mind in making this recommendation. The Commission said: "The line between gold in hoards and in circulation is an indefinable one, and the hoarding habit is sanctioned by the experience of centuries in India and by religious and racial laws and customs with which the Government of India have neither inclination nor power to interfere: any attempt to refuse gold to meet these legitimate demands would be unjust and foredoomed to failure and could only cause alarm and instability." Now, I will refer to paragraph 3, if I may, of your memorandum, and particularly to the final paragraph where you say: "But the advocates of this view do not refer to the discussions of the Genoa Conference and are possibly not acquainted with the contrary arguments." What, in your opinion, are the chief contrary arguments in

* Appendix No. 32.

this connection?—I think that comes on in the next paragraph, the danger of great appreciation of gold.

6659. The danger of great appreciation of gold, that is one. Do any others occur to you? We have had in evidence a certain amount of discussion on the subject of the expense of a gold currency as contrasted with an exchange standard; was that in your mind as a contrary argument?—That certainly is one of the contrary arguments of great importance.

6660. Is there anything else that occurs to you of perhaps equal importance with these two considerations?—Well, I should like to explain that so far as my personal views go on the subject, they are of no value at all; because I have no connection with the management of currency in this country and never had it; it is entirely a matter for the Government of India. All that I have done is just to put together some of the principal arguments that occurred to me from a cursory reading of the subject.

6661. I appreciate that, and if I may say so I think it is of particular interest that what you have really done in your memorandum is to give us what you find to be the leading considerations present in the mind of the instructed public on this question. You enable us thus to arrive at a clearer idea as to what the public opinion is with which we have to deal. So that throughout I look upon your views, if I may say so, just as you have told me, as not being your own views, but what you know to be present in the minds of instructed public opinion?—That is what I have attempted to put forward.

6662. Precisely; and what I am really asking you to elucidate is, as it were, the instructed public opinion all over the country, and not your own opinion?—So far as I am acquainted with it; that again is a secondhand acquaintance.

6663. We shall not under-rate the extent of your acquaintance. I just want to be clear what you mean when you say. "A currency policy unwisely adopted may therefore intensify the disruptive forces of civilisation." I understand you are referring to the possibility that, if gold be appreciated greatly by a sudden new demand, salaries and wages may not adjust themselves to the new standard of values until some time has elapsed?—Yes, certainly.

6664. That is the intensification of the disruptive forces to which you refer?—Yes.

6665. I am not to ask you your own opinion as to the possible effects upon the world gold market of such a demand for additional gold?—I am afraid it would be worth nothing.

6666. I could not agree that it would be worth nothing; but I must respect your reserve on the subject. Then you say "Since the rupee has remained stable in the neighbourhood of 18d. for over a year now, there is every reason to suppose that it could be stabilised at about that rate." Are we to take it that that is the common opinion?—I think it is a common opinion that it could be stabilised; but in Bombay certainly it is the common opinion that it should not stabilised at that rate.

6667. What do you believe to be the common opinion of instructed people as to the effect on the maintenance of a 18d. rate of a couple of bad years, bad monsoons or bad trade?—Well, there would be some anxiety that the Government of India could not do anything effective to maintain the rupee against a succession of bad monsoons. I do not know that two monsoons would be generally considered to be sufficient to break the exchange; but we have had a series of more than two bad years in succession; if it went on for three or four years, I suppose most people would say that the rupee could not be maintained.

6668. Do you, or do you not, find it commonly recognised that one rate is no more difficult to maintain than another, given that the adjustments in the way of contraction or expansion of currency necessary to adjust prices to their levels have been completed?—I think the answer to that must be "yes"; it would be possible if the adjustments are ready for adoption.

6669. "There is reason to believe," you say, "that the importation of gold bullion and sovereigns of over 200 crores in the last 6 years has supplied the demand which, during the war, could not be met, and that the country is now fairly replete." Does that mean that the arrears have been made up, and that what we are to expect in the future is only the normal average demand for gold bullion for India, or does it mean that the requirements of the country have been anticipated for some time to come, and that we are to expect a falling off in the demand for gold?—I think it means that the arrears have been made up. I believe that the importations used to be somewhere about 20 millions over a period of years, though recently the average is over 35 or 36; and I see that in a recent report of the Controller of Currency, for 1924 I think it was, he formed the opinion that the demand would go down to the previous rate; as far as I understood it, he meant that it would be about 20 millions in the future instead of over 36.

6670. So that the reference to repletion means, I understand, that we shall now get back to the normal demand such as we have in an average year?—Yes.

6671. Not that no more at all will be required?—No.

6672. You quite clearly argue that the balance in favour of India would tend to raise the rupee to a higher value, that it would be a force tending to keep the rupee at a high value; but I imagine that it would tend to correct itself, would it not, in course of time owing to the encouragement of other imports by the higher gold value of the rupee, so that we should look upon that as only temporary?—That is an accepted theory.

6673. In the next paragraph you say "Since there is no clear indication that the interests of the country have been injured by the variation in the level of exchange in the last few years there does not appear to be any urgent necessity for measures of stabilisation." When we are considering the intrinsic desirability of a stable exchange value for the rupee, what importance would you attach to the facilitation of the investment of foreign capital in India?—Well, we have recently been told that there is plenty of capital in India to serve its own purposes if it could be drawn out and that investment of foreign capital, while still desirable to a great extent, is not of the same urgent necessity as it was in the early stages of industrial development in India.

6674. To induce the people of India to invest their accumulated savings in the development of India is, of course, the major object for everybody who considers this question, is it not?—Yes, certainly.

6675. All parties, all schools, put that before them as the object to be served?—I think everybody is agreed on that.

6676. The only difference being as to how that object can be best and quickest served?—Yes.

6677. Nevertheless, we can perhaps recognise that a stable rate of exchange is of assistance to a country which is in need of capital for its development by facilitating its flow from abroad?—Yes, certainly.

6678. I suppose also from the point of view of the export and import trade of the country it is the common view that, as trade is hampered at any rate by violent fluctuations in exchange, it is a sensible view?—Yes.

6679. So that there are definite objects to be served by stabilisation of exchange?—Yes, but as between stabilisation of exchange and stabilisation of prices, I stated further on that stabilisation of prices is the more important.

6680. Yes, but the other object must not be lost sight of. However, you come to the conclusion that, on the whole, the time is ripe for a forward move. You express the opinion in paragraph 10 that a

rising rupee encourages imports and a falling rupee encourages exports. The encouragement in each case is temporary until wages have been adjusted to the new levels. Do you consider that wages in India are likely to be more or less sensitive to such influences than they are in the countries of Western Europe?—I think they are less sensitive. They have not got the same organisation for their own protection.

6681. The organisation is weak?—Very weak.

6682. On the other hand alternative employment is more available, is it not, to the industrial worker in India than it is in, say, a purely industrial country?—Yes, certainly that is the experience in Bombay City. The cotton mill hand can get back to his fields and he generally does spend part of every year in cultivating or harvesting. That is the great safeguard to his position.

6683. Does that make a bargaining factor which to any extent makes up for the looseness of his combination? He says: "I don't like this job, I can go off to my village"?—Yes, I think so.

6684. Very important, of course, in considering this question of readjustment is the question whether the cost of living is sensitive in India, as it is elsewhere, to changes in the gold value of the currency, as expressed in exchange rates. We have heard a certain amount of discussion as to whether the cost of living is sensitive to these changes, particularly in relation to the cheapest foodstuffs which form the staple of life at any rate of such a province as Bombay. A little lower down the page, you refer to the opinion that the price of wheat reacts on all other food grains, and thereby on wages and the cost of production of every industry. It is a fact, I understand, in your experience, that the price of a world foodstuff such as wheat has a definite re-action on the price of these Indian grains which are the chief staple of life to the poor?—I think there is no doubt about that.

6685. Have you been able to follow that out at all in your experience?—Well, of course, the circumstances during the war were subject to many abnormal factors. But during the war, there was much export of wheat and there was great scarcity at the same time of other grains. It is very difficult to say that it was the rise in the price of wheat that sent up the price of all other food grains, but it did coincide. And there has been a great turnover in the consumption from the cheaper food grains to wheat in various parts of the country, the Punjab and Sind in particular, and there the price of wheat undoubtedly is the governing factor.

6686. I might follow that up by a step which is possibly theoretical, but none the less it may cast some light upon this problem. Supposing we were to try now to reduce the rate of exchange to 1s. 4d., that would have to be done, would it not, by reversing such processes as have led to a rise to 1s. 6d.?—Yes.

6687. Those processes were the contraction of currency, and the reverse processes would be the expansion of currency?—Yes.

6688. If you expand currency under these conditions, it means you have more purchasing medium in the country in relation to the stuff to be bought?—Yes.

6689. And I suppose one would expect that to affect all prices in the country?—I think it would have that effect.

6690. Whether the goods were partially exported or entered into the world's markets or not?—I think it would have a universal result.

6691. Apart from the merely theoretical basis, I understand it would be an ordinary calculation which you can confirm from your experience as to the effect of these changes on the prices of these stuffs?—Yes.

6692. Then, you say that "Some advocates of this school of thought regard the depreciating currency of continental countries as a positive advantage, and have failed to give due weight to the strenuous efforts which such countries as France and Italy are making to raise their exchanges." That is an illuminating comment, about which we have heard something but not much. What would you say was the essence of the evil which those countries are seeking to rid themselves of by stopping the depreciation of their currency?—The essence of the evil?

6693. Yes?—I take it to be the disturbance of social relations, maladjustment of wages and salaries and the consequent pinch for all the lower and middle classes of society.

6694. A general disturbance of the relation between debtor and creditor. In that you refer to the middle classes, by which I understand you are suggesting that the creditor who would feel such a movement most is particularly a member of the middle classes who had invested his savings in some fixed interest bearing security?—Yes, certainly.

6695. And a fall in the gold exchange value of his currency acts as a concealed tax in addition to his Income Tax?—Yes.

6696. That has been carried so far in countries with extremely depreciated currencies that it is likely to reduce the rentier classes to extermination?—Yes.

6697. Your argument based upon that is that although there may be no question of such extreme depreciation in this country, yet in proportion as you reduce the rate of inflation you should reduce proportionately these evils of injury to the fixed investor and the creditor classes of the country as a whole?—Yes.

6698. Then we bear in mind that we have agreed, have we not, in the course of our discussion this afternoon, that the great object that we want to set before ourselves is to teach the people of India to invest?—Yes.

6699. So that we have to bear in mind that we may not be promoting that object if we impose anything in the nature of a concealed tax upon them?—Quite so.

6700. Now let me look upon the other side of the picture and ask you how you would describe Indian opinion in relation to the advantages of a reduction to 1s. 4d. What is your opinion as to the advantages that would be conferred in particular upon the cotton industry of Bombay?—Well, the common belief in Bombay appears to be that with the rupee at 1s. 4d. the cultivator will get more money for his products and will be able to invest more largely in cotton goods. That is not borne out by some recent researches by Dr. Mann, who is Director of Agriculture here, who investigated the result of high prices on village conditions in the Deccan. He came to the conclusion that the great majority of cultivators did not benefit by higher prices on the ground apparently that they had so little surplus to sell. I do not say that Dr. Mann's investigations received general support but he is an investigator of some reputation and that is a theory that he recently put forward.

6701. Nevertheless a fall to 1s. 4d., achieved by such measures as you describe, would undoubtedly increase the price which the cultivator would receive for his produce?—It would for such proportion as he sells, of course. The great mass of petty peasant proprietors do not have a considerable surplus to sell; they very largely live on their own cultivation.

6702. The absolutely self-contained agricultural unit, which produces all that it consumes and buys and sells nothing, and is removed from all possible influences of any sort or kind from the outside world, can practically be left out of account; it cannot be effected for good or ill; but if it has any surplus to sell, the peasant would undoubtedly get a larger money price?—Of course that is in the case of the great commercial crops and not food-grains; for instance there is a certain area in Bombay which

grows chiefly cotton. They necessarily would receive higher prices because they depend on the price of their cotton to buy the other food-grains, but that factor is not to be over-estimated because the whole cotton cultivation of India does not represent much more than 5 per cent. of the cultivation of India.

6703. Are these cotton growers employers of labour?—Yes, the cotton grower employs a considerable amount of labour for the picking of his cotton.

6704. What would be the ultimate reaction upon these cotton growers of a general rise in price levels, including the price of their product, cotton?—I should think that probably it would encourage the cultivation of cotton. Any higher price of cotton will encourage the further cultivation of that crop.

6705. Then looking at the millowners, the manufacturing interests, how will they stand when things have worked themselves out?—They think that they would profit by a lower rate, but I doubt, when the rupee is stabilised and has reached a certain figure and remains constant there, I doubt whether their operations would be affected one way or the other.

6706. Are you thinking of a rise in their wages bill, because some evidence has been given to us to suggest that there would be no rise in wages as a result of the rise in prices which would follow on the introduction of the 1s. 4d. rate?—I think it would take some time for the employees, for the mill-hands, to be able to secure a further increase of wages, but if prices remain high for a considerable period, it would undoubtedly lead to a greater industrial unrest; they have had several strikes within the last year, and they would probably have more strikes in the future, and the mill-owners might adopt the policy of raising the wages of their mill-hands for safety.

6707. There is an intermediate passage in your memorandum in which you refer to some aspects of the tariff question, which you introduce with the statement, with which we concur, that the Currency Commission are not concerned with the tariff policy as it might lead to a formidable extension of our inquiry. But I wanted to clear up a point which may turn out to be of some importance as regards the idea of such legislation as that which has recently been adopted both in this country and in England. You say that "The principle was accepted in the orders passed last February for the safeguarding of industries in England, and was put into force in Australia on March 25th last for protection against the depreciation of Japanese currency." The principle to which you there refer is that of assisting the export industries of a country, to protect them against an appreciation of their own currency and those hindrances to export which are recognized to result in such an appreciation. But if we refer to the English policy, it was contained in the Safeguarding of Industries Act of 1922, and that was rather the converse, was it not,—an attempt to protect selected industries against other countries' depreciated currencies?—Does it not have a similar effect to the appreciation of the home currency in terms of the foreign currency.

6708. It is quite true that there are two aspects. Nevertheless, there is probably an active movement downwards or upwards in the one, while the other remains passively at rest. There are very minor changes in the value of English currency, while there is an active movement in foreign currencies, and the facts that you are considering here affect the movement relatively of Indian currency. That leads to a question I wanted to ask, *viz.*, whether your study of the result of the English experiment would lead you to agree with the contention which has been widely advanced, that our experience under the Safeguarding of Industries Act shows that the amount of advantage which might be given temporarily by a violently fluctuating currency was so great that it is quite impossible to counteract it by any tariff, and, in particular, the maximum of 33⅓ per cent. which was the tariff originally selected under the Safeguarding of Industries Act, was perfectly inadequate for that purpose, and that some of these temporary advantages would be of a quite different order of magnitude?—I believe that was so.

6709. Indeed our experience of this as a measure to smooth out changes in trade, and the variations of trade produced by changes in the value of the currency, is not a very fortunate one?—Not when the currency fluctuates so violently as it has done on the Continent. But in regard to the recent Australian action with the Japanese currency, I understand that the depreciation in the Japanese currency is somewhat on the same scale as changes in the Indian rupee. Now it has gone up to 1s. 9d.,—in any case it was never more than 35 per cent.

6710. The arguments which you refer to in your memorandum which express, as you told us, something of the nature of what you call the best instructed opinion in India, are summarized in the concluding paragraphs. Those of a most direct interest perhaps are in paragraph (*c*), where you arrive at the conclusion that, "With the balance of trade greatly in favour of India, the rupee if uncontrolled would probably rise to a moderate extent. It is probable therefore that the Government of India would be able to stabilise the rupee at such moderate rate as they might decide; but a return to a 2s. rate would be unwise," the chief influence being that to which you have already referred, that is the cessation of the imports of gold bullion; and in your final paragraph you say that although "the rate of 1s. 8d. would be probably possible, in order to avoid unnecessary disturbance in trade and commerce, the present existing rate of 1s. 6d. between the gold points should be adopted and would be most easy to defend." There is just one final question I would like to ask, and that is this. We have had certain evidence with reference to the question of the currency system which should be adopted in India, whether it should be a gold exchange standard system or a full gold standard system with a gold currency. We have had evidence to the effect that the cost of introducing a full gold standard with a gold currency would be eventually some 1½ crores per annum; and, if I may, I would ask you to assume that figure, 1½ crores, as the charge. We have had other evidence to the effect that the reduction of the rate from 1s. 6d. to 1s. 4d. would impose an immediate additional burden of 3 crores a year on the Budget of the Government. Will you assume, therefore, that the cost of introducing a gold currency and at the same time reducing the ratio would be something of the nature of an annual charge of 4½ crores. I want you, on the other side of the picture, to consider for the moment, if you will, the obligations of the Government of India to the provinces in respect of the remission of provincial contributions. What, in your opinion—(I think I may fairly ask you your own opinion on this)—would be the rights of the matter as regards the choice between those two objects? Would it, or would it not, be right for the Government of India to incur this additional burden for currency purposes in preference to a remission of provincial contributions? Or would it be right for the Government of India to say that the remission of provincial contributions must come first, and that currency reform as involving further expense should come second? Or do you see a possible third alternative?—Well, the Government of India have several times announced that they consider the reduction of the provincial contributions to be of primary importance. The Government of Bombay have equally strenuously maintained that the reduction of provincial contributions should not be the important policy of the Government of India; so that, so far as Bombay is concerned, if the gold currency and the reduction of the rupee to 1s. 4d. did cost 4½ crores of rupees and if they led to greater prosperity in India, we should certainly prefer any measures adopted to greater prosperity in India rather than any measures tending to the abolition or cancellation of the provincial contributions. I

may perhaps mention that the Government of Bombay are the last Province to receive any material benefit from the cancellation of these provincial contributions. It so happens that the other provinces have a prior claim according to the system that has been established. That system is strongly disapproved by the Government of Bombay. They are very nearly last on the list for any advantage and I do not claim to speak without prejudice in this matter. From the point of view of Bombay, we should not attach much importance to the removal of the provincial contributions.

6711. (*Sir Henry Strakosch.*) Mr. Lawrence, you stated, and I think everybody is agreed, that it is of supreme importance for India that her people should cease to put their savings in entirely unproductive things such as gold and silver and that they should put those savings into forms which would help to develop the country. Now there are two schools of thought in this matter; one suggests that the only way, the best way, of inducing the people to save is to give them a gold currency, gold in circulation in the country and that that in itself will induce them, having gained confidence, to put their savings into instruments of credit; and the other school suggests that a better way would be to first educate the people in investing their savings on productive things, and then, when that was done and when the danger of hoarding is removed, give them a gold currency. Which of the two alternatives in your view is the more likely to achieve the end?—By what method to educate the people?

6712. By offering them instruments of credit such as cash certificates or possibly increasing the rate of interest allowed in the post-office, expanding the banking organisation of the country, establishing a central bank which would make banking safer and such like.—Yes. I think in either case it will take a long time before the hoarding habit is appreciably removed; because I think that hoarding habit is due in part to a desire to conceal wealth from a sense of insecurity, and up-country that sense of insecurity still prevails; and I think it will be a long time before either a gold currency or banking facilities will reach the people.

6713. Even a measure which would lead to putting a large amount of gold into circulation would not, in your view, expedite that process? Would it?—Perhaps there may be some effect. But I don't think any great effect. I do not think it will be of sufficient importance to make it a conclusive argument in favour of the gold currency.

6714. Then one other question; if a gold currency were introduced, opinions are divided as to what would happen to the hoards at present invested in silver rupees. What would happen to the hoards invested in silver bullion and the note circulation? Would you say that, if gold were freely offered, and if simultaneously with that offering of gold, the status of the rupee were reduced to that of a token of limited legal tender, these hoards would be exchanged for gold?—I think there will be powerful incentive to do so. I think a very large amount of silver would be changed into gold.

6715. Have you considered what the size of those hoards is?—I have seen certain figures; I know they are of very large size.

6716. Is it possible to approach the true state of things more closely than the estimates that one generally hears?—I do not know what data those estimates are based upon. I have not got any opinion on that point.

6717. Do you anticipate in these circumstances that the note circulation will be reduced, people preferring to hold gold coin to notes?—For actual currency?

6718. Yes, for actual currency?—Daily marketing and so forth?

6719. Yes?—No; I think the note habit has grown very widely while people keep gold locked up at home. A ryot when selling his produce will sell it more readily for gold than he will for notes. It is true that the gold must pass from hand to hand to a certain extent; but if he can, he will put the gold into the reserve and circulate the notes.

6720. And if the notes remain in circulation, would you say that the reserves to secure the exchange value of those notes and stabilise the exchange, have to be smaller or greater than the reserves under the present system?—That is outside my experience.

6721. Then there is just one point with reference to the statement you made regarding the possibility of an appreciation in the purchasing power of gold and to the Genoa resolutions. You don't wish to express a view in that regard? But may I ask you, do you regard the question of the effect of a substantial absorption of gold in India upon the purchasing power of gold of first importance when we consider whether it would be advisable or not to introduce a gold standard with gold currency in circulation in this country?—Do you mean whether the danger of the appreciation of gold will be serious?

6722. Or let us say, the effect of such an action upon the price of gold; is it a question of the first order which has to be closely investigated before any such step can be taken?—Certainly, it requires a close investigation. Such figures as I have seen of the trade output of gold in the next 10 or 20 years and the demand of gold vary enormously and I have not formed an opinion as to which school of thought is right. Certainly it is a matter which requires careful investigation; but I cannot express an opinion whether the future supplies of gold from the existing sources will be ample or whether new sources can be discovered; they are questions on which I have no accurate information.

6723. Supposing, as some witnesses have said, that there is really a redundancy of gold in the world, then the fact that India adopts a gold standard and a gold currency and so takes off the surplus of monetary gold available, would have a beneficial effect, because it would probably tend to stabilise the purchasing power of gold?—Yes.

6724. But if the other view were correct, viz., that the future production of gold will not keep pace with the economic development, and consequently that there will follow an appreciation of the price of gold which connotes falling prices, what effect, in your view, will that have upon the internal economy of India?—Well, I am of opinion that stability of prices in India is of primary importance. Prices are at present higher than the country has been accustomed to in previous generations and a moderate decrease would, I think, be beneficial. But if prices fall very heavily, then you upset all relations between debtor and creditor with what may be very serious results.

6725. And you impede trade because falling prices always impede trade?—Impede trade to a certain extent. I believe there have been periods of fall in prices when though profits have not been on a large scale yet trade has expanded and relations have not been unsatisfactory; but that again is a question which I am not very fully informed of.

6726. Then with reference to your statement in paragraph 16, where you deal with the measures for the safeguarding of Indian industries on the analogy of the English and Australian Acts for the Safeguarding of Industries, would you agree that the Safeguarding of Industries Acts in Great Britain and Australia were primarily introduced so as to counter-balance any advantage that may arise to a country with a depreciating currency, an advantage which arises from the lag in adjustment of internal and external prices?—I think so; I think it is perfectly correct.

6727. Now, to safeguard India in that respect, if the exchange were fixed at any point, so soon as the lag adjusted itself in India, any need of safeguarding would disappear?—Certainly, it should disappear.

6728. And therefore this Act would really, if it is to be applied for that particular purpose, have to go out of action as soon as the adjustment has taken place?—Yes; it should be a temporary measure.

6729. Entirely a temporary measure?—Yes.

6730. (*Sir Reginald Mant.*) Mr. Lawrence, we have received a good deal of evidence here in favour of reducing the value of the rupee to 1s. 4d. You give in your memorandum a number of reasons why that view is held. Would it be correct to say that it is mainly due to the belief that the lower exchange would be advantageous to the cotton mill industry which is the main industry in Bombay?—Not only the cotton mill industry but I think all exporting firms hold that view, that it would be advantageous to them.

6731. It is from the point of view of export then?—The cotton mills and exporters, those are the two sets of local industrialists who are the principal exponents of this view, I think.

6732. Exporters of cotton goods or all exporters?—No, exporters of wheat, pulses, oilseeds, all exporters in short.

6733. Turning to the cotton mill industry I gather from your memorandum that you do not consider that a reduction in the rate of exchange would be so beneficial as is generally believed. You point out that the raw cotton constitutes 60 per cent. of the cost to the mills and that 7 per cent. is incurred on imported goods, so it is only in respect of the remaining 33 per cent. that there would be a temporary reduction in cost from depreciation of the rupee?—Yes.

6734. But you also mention the general belief that with a lower rupee the cultivator would have a larger purchasing power?—Yes.

6735. You instance the grower of cotton and you point out that he would get a larger number of rupees, the value of which would be to some extent reduced by the increased cost of labour?—True.

6736. Would not the whole of this profit, the whole of these increased receipts be counterbalanced by the general rise in prices as soon as they had adjusted themselves to the new rate and would he in the end be any better off than before?—Well, opinions differ on the point. I think it is possible there might be some small percentage of advantage in his favour; but I have pointed out that this cotton cultivator only represents 5 per cent. of the cultivators of India.

6737. And as regards the remaining 95 per cent. do you think they would derive any permanent benefit from the lower exchange value of the rupee?—Researches are somewhat at variance one with another but I think that there is a considerable body of opinion that they would receive no advantage. With cotton, of course, you put other commercial classes, jute growers and growers of other fibres and so forth. Taking all those who sell commercial products apart and those that sell food-grains the percentage of the whole class would be about 15 per cent. to 85 per cent.

6738. I gather then that on the whole you are of opinion that the belief that the cotton mill industry would be benefited by depreciation of the rupee is to a great extent ill-founded?—Yes.

6739. (*Sir Purshotamdas Thakurdas.*) You think Mr. Lawrence that the adjustment of prices after the disturbance of the ratio from 1s. 4d. to 1s. 6d. is now complete?—The adjustment in prices?

6740. Yes; owing to the appreciation of the rupee there has been a disturbance as you say and that disturbance has to adjust itself. Do you think the adjustment is complete now or there is still mal-adjustment in the level due to the disturbance of the ratio?—I do not think I can answer that. I do not know.

6741. May I refer you to paragraph 10 of your statement where you say a rising rupee encourages imports and a falling rupee encourages exports until wages have been adjusted to the new level of prices. May I ask you if you think that the new level has been formed?—That is in regard to the rising rupee and in regard to the cotton mills?

6742. Generally, the adjustment of everything which is likely to be disturbed by the disturbance in the ratio?—No, in the matter of wages I think certainly there has been no adjustment during the period the rupee has gone from 1s. 4d. to 1s. 6d. That is only one year and a month or two.

6743. Therefore there is still some mal-adjustment left?—In wages certainly. I thought you spoke of prices.

6744. And to that exent any change in the ratio from 1s. 6d. to another would not be a complete disturbance of an adjustment which is not complete?—No, you may say that.

6745. May I refer you to the next paragraph "During the period of transition merchants and other middlemen make larger profits at the expense of producers or consumers." You think we are in the period of transition just now or out of the period of transition?—There are a great many factors to be considered in regard to the profits that merchants and middlemen make, but I think that this particular factor has not yet been adjusted.

6746. This the second factor, this also has not been adjusted; and do you think middlemen still continue to make profits?—That is the tendency if it is not uprooted by other more violent factors.

6747. But then, as to the tendency that you refer to in paragraph 11 (the first part) "During the period of transition . . . merchants and other middlemen make larger profits at the expense of the producer or the consumer"; at the moment do you think that that period of transition still continues?—I think so, yes.

6748. In paragraph 13 again you say that it is difficult to support the propaganda in India in favour of a depreciated rupee. You refer to the strenuous efforts which are being made in Italy and France to raise the exchanges. Of course, I am sure it is quite clear that France and Italy are trying to go back to their pre-war ratio. In the case of India, what you call propaganda and which you say is difficult to support, the people only ask for a reversion to the pre-war ratio instead of a rise from it. In the case both of France and Italy and of India the idea is to get back to the pre-war ratio and no change from the pre-war ratio. To that extent it is a common theory underlying all three?—Well, I am not quite prepared to accept that. It depends on over what period you take your view. The rupee has been up and down at various times so that people seem to advocate a depreciating rupee without fixing any point to which it should fall. In 1894, there were people at the time the Mints were closed advocating that the rupee should go down below 1s. 3d. So my remark there is of very general application. When you have got the rupee down to 1s. 4d. there will still be advocates who will wish it to go down to one shilling or sixpence or a penny.

6749. Have you heard anybody during the past few months suggest a change from 1s. 4d. downwards?—I have never discussed that.

6750. But have you heard lately, anybody advocating a change to under 1s. 4d.?—I think it would be the logical result of their argument. I do not say they put it forward in that form.

6751. Well, on the other side there are those who say that the 2 shilling rate which is on the statute may be the aim of the Government of India. I am not talking of such logical arguments. I am talking of actual facts as people have put forward their views. Have you heard anybody advocate a decline to under 1s. 4d.?—I am afraid I have not discussed this point.

6752. No, but you referred to the propaganda in India and I thought that perhaps you had discussed with somebody?—I refer to what I have seen in the papers.

6753. Have you seen anything in the papers advocating a rate under 1s. 4d.?—I was reading a memorandum or letter by Mr. J. A. Wadia yesterday advocating 1s. 4d. The result of what he was advocating would be to bring the rupee down below one shilling. He wants to open the mints to silver and introduce a silver standard.

6754. Did you read his written statement before tho Commission, is that what you have in mind?—I read something in the paper, I do not remember what it was.

6755. Now in paragraph 15 you say "When the high rupee is stable the costs will fall and the industry will compete in a fair field; in the interval the industry has a claim to protection." You have told us that wages part of the cost of an industry has not yet adjusted itself. Therefore, the industry has a claim to protection as far as this mal-adjustment in wages is eoncerned?—Yes.

6756. Do you think that until the adjustment is complete the Government of India ought to recognise the claim of the cotton industry to protection to that extent?—I am afraid I am not entitled to express an opinion on that, even privately.

6757. I only wanted to point that out, I am asking because you have made a statement in your memorandum; if you do not want to follow it up I am the last person to press it any further. I wish just to ask one question, regarding paragraph 25 (*b*), Mr. Lawrence, at the end of your written statement. You say there "To conclude the arguments above stated may be summarised to indicate the rate of 1s. 8d. would be probably possible." Do you mean in the distant future or do you mean for consideration at this enquiry?—I think that that might be the result if the United States set free their enormous holding of gold. I believe it is 600 million sterling. There is some talk of setting some of that free and that would lead to an inflation of prices in the United States; that would certainly react on prices in the United Kingdom and have a further reaction here and probably in the next few years, perhaps, drive up the rupee to a higher rate.

6758. You do not think that this question of stabilising at 1s. 8d. is one which ought to be taken into consideration by this Commission?—No; I merely attempt to estimate the economic factors which are under eonsideration in the world's market; that is all.

6759. May I ask you whether the United Kingdom is likely to raise their ratio of gold as a lever for control of prices? When the United States let the gold out and if the prices go up as you say both in England and out here, do you think that the United Kingdom is likely to change their ratio in order to control their prices?—I cannot foretell the policy in tho United Kingdom.

6760. They made strenuous efforts to retain their pre-war ratio of gold and got to it too?—Yes.

6761. India is the only country in the world where the pre-war ratio has been altered; we have not heard of any other country which has trifled with its pre-war ratio?—There are many other countries in which the pre-war ratio is not yet existing.

6762. (*Sir Purshotamdas Thakurdas.*) Because it is impossible for them to get it; but they are very anxious to get it; no country has been anxious to disturb pre-war ratio. Thanks very much: I am much obliged.

6763. (*Professor Coyajee.*) Only one question, if I may, arising out of Sir Purshotamdas Thakurdas' last question to you: in the United Kingdom they have got a very powerful machine for controlling prices, namely, the discount rate, and that financial weapon we in India possess to a very slight extent; and consequently, perhaps, we might have to make more use of the exchange method of controlling prices?—Yes.

6764. (*Chairman.*) Is there anything, Mr. Lawrence, which you would like to add at all or anything which we have failed to understand as well as we might?—No, I do not think so.

6765. (*Chairman.*) The Commission is very much obliged to you for your very full and kind assistance this afternoon.

(*The witness withdrew.*)

AT 1, COUNCIL HOUSE STREET, CALCUTTA.

EIGHTEENTH DAY.

Monday, December 21st, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.

Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER, } (*Secretaries*).
Mr. A. AYANGAR, }

Dr. PROMATHANATH BANERJEA, called and examined.

6766. (*Chairman.*) Dr. Promathanath Banerjea, you are Minto Professor of Economics in the Calcutta University?—Yes.

6767. You have been kind enough to come to assist us to-day, and you have also provided us with a very full memorandum* setting out your views upon the matter referred to us. I will, if I may, ask you a few elucidatory questions. In paragraph 2 you say:—"It should be remembered in this connection that there is not only no conflict between stability in internal prices and stability in foreign exchanges, but that the two are, to a considerable extent, closely inter-related." I gather it would be your view that, if exchange is automatically stabilised in gold and

* Appendix No. 33.

gold value for internal currency, internal gold prices must adjust themselves to world gold prices?—Is the point how far stability in internal price and stability of foreign exchanges are inter-related?

6768. I will just repeat my question. If exchange is automatically stabilised on a gold basis, then internal gold prices must adjust themselves to world gold prices?—Yes.

6769. You do not get rid, of course, of fluctuations in prices due to fluctuations in the purchasing power of gold, but you get rid of other causes of instability?—Yes.

6770. In paragraph 3 you refer to articles which are in the nature of monopolies. What are the Indian monopolies?—It seems to me that jute is the only article which may be called a monopoly. Other articles may be regarded really as partial or conditional monopolies, not absolute.

6771. Therefore, articles with a special market, such as Indian tea, would involve a partially monopolistic market?—It has a large sale. It commands a large portion of the tea market but it can hardly be regarded as a monopoly.

6772. Both jute and Indian tea are subject in different degrees to competition from other articles, are they not?—Tea is subject to competition, but as regards jute, there are substitutes in some form or other.

6773. As you rightly say, there is some price at which the monopoly of any article tends to break down by the forcing of substitutes on to the market?—Yes.

6774. You quote from Professor Jevons that "the price in the world's markets of articles of export subject to competition does not respond to the rise of the Indian exchange, and the supply of these commodities from India may cease altogether, or can only be continued at a lower cost of production,—in other words, wages and profits must fall." I have not been able to verify the quotation, but is the word "and" correct, because one would rather expect there the word "or", wouldn't one? If wages fall adequately, then profits may be unaffected. If profits are reduced, then wages may not need to be reduced?—Either of the two will produce that effect. I am not absolutely sure, but I think it ought to be wages or profits or both.

6775. Wages, profits, or both?—Yes.

6776. But in so far as one of these two falls, then the other is relieved from the pressure leading to a fall, isn't it?—Yes.

6777. In the next paragraph you say: "A rising exchange, by reducing the rupee prices of imported commodities, places the locally produced goods at a disadvantage." I want to know how far you cast the net in that statement. Would you extend it so far as to include all locally produced goods or only some locally produced goods?—Those locally produced goods which compete with foreign products in the Indian market.

6778. Is it your opinion that a rising exchange has the effect of reducing the cost of living as a whole to the humbler classes?—If the locally produced goods find it difficult to compete with foreign goods, the imported goods, then wages will have to be reduced.

6779. Cost of living, I said?—I beg your pardon. As regards cost of living, it depends on the articles which enter into it. If the imported goods constitute a very large portion of the goods consumed, then of course it leads to a reduced cost of living, but, if on the other hand it does not enter to a very large extent into the cost of living, it does not produce much effect.

6780. What is your view in regard to the effect of a rising exchange upon articles which are produced and consumed in India, such as the grain and stuffs which form the food of the poorest classes?—The food of the poorest classes is wholly produced locally and there is no portion of it imported from abroad.

6781. What, in your opinion, is the effect of a rising exchange upon the cost of living on the poorest classes in that regard?—The poorest classes import cloth and a few utensils from abroad. But during the last two decades the Indian mills have been producing cloth for the poorer classes to a larger extent than before.

6782. They are subject to effective competition, are they not, from, for instance, the Japanese market?—Yes.

6783. So one would expect that they would be affected by a change in the price of the imports?—I was going to say, yes they would be. The price of the locally produced cloth would be affected by the competition of the foreign product and to that extent the poorest classes of the people would be affected by a rise in the value of imported goods.

6784. What is your opinion as to the effect on the price of cheap grains of a rising exchange?—A rising exchange would depress the exports and therefore the price of grain is likely to be less.

6785. You believe that there would be a general fall in all these commodities?—Yes.

6786. Can one summarise it possibly by saying that a rising exchange is a consequence of a contraction of the currency, unless there is a very great increase in the rapidity of circulation, which, it is not sound to suppose, necessarily means a general fall in prices?—Yes, a general fall in prices would be the result. But how far the different classes of the population would be affected by it, would be a more complex matter.

6787. In paragraph 6 you say: "The effects of a falling rupee are the reverse of those of a rising rupee. Exports are stimulated, while imports are checked. These effects are, however, temporary." Is it your opinion that these effects to which we are referring are temporary equally in both the case of a rising or a falling rupee?—Yes, in both cases they are temporary.

6788. I was not quite sure whether that was inclusive or exclusive?—Yes, in both cases they would be temporary.

6789. In paragraph 7 you say: "The effect of higher exchange on the country as a whole is adverse, so far as its foreign trade is concerned." A little higher up you say that "wages and profits are in the same relative position (i.e. after the adjustments no doubt) as they were before the transition commenced"?—Exactly.

6790. Why, as far as foreign trade is concerned, is the effect adverse if wages and profits are in the same relative position?—Well, if we suppose that the export trade of India is 300 crores in value and the import trade about 220 crores, then if we take the import as a whole India would lose by a higher exchange on the balance of the 8 crores.

6791. There is a sentence in the latter part of that paragraph which at first sight I don't quite follow. You say that "India's exports exceed her imports in value by a large annual sum, varying from 60 to 80 crores. Higher exchange thus means considerable loss on account of this trade balance." That I think requires some explanation. India no doubt requires fewer rupees for the excess, but then, on the other hand, the rupees have a greater purchasing power. Where, then, is the loss?—Yes, after the adjustments, of course, there is practically not much effect, but then during the period of transition this is felt.

6792. Then I have been a little misled perhaps by the initial words of the paragraph: "Let us now consider the permanent effects of higher exchange." I understand you are of opinion that, adopting the ordinary analysis, this effect is a temporary disturbance during the period of adjustment?—But as I said in the previous paragraph, although the effect is temporary it generally takes a long time. The period of transition is not necessarily very short.

6793. You then raise the question of the currency system, and I will proceed to a few questions on that subject, again to ascertain the strong points in your argument. You say, "the gold exchange standard has failed to satisfy the tests of a sound system." Are you referring here to Indian experience?—Yes.

6794. What would your reply be to the contention, which has been frequently put before the Commission, that India has never in the past had a sound gold exchange standard, so that Indian experience should not be looked upon as evidence against a sound gold exchange standard?—We have had no experience of what may be called a real gold exchange standard. But the gold exchange standard that has prevailed in India in the past has failed to satisfy the test of a sound currency system. In any case management would be inseparable from the system of a gold exchange standard, and of course I am not opposed to management in any shape or form, but my view is that management should be confined within as narrow limits as possible.

6795. What do you consider to be the principal particulars in which the pre-war exchange standard system in India failed to be a scientific exchange standard system?—In the first place it showed a tendency to a breakdown whenever there was any difficulty, anything approaching a crisis, as in the years 1907 and 1908. Then again the management of the reserve has in the past led to much trouble and suspicion in the minds of the public. Then there is the fixing of the exchange rate. People fear that the exchange rate is often manipulated in the interests of other people. Then also you have to purchase silver if you have to maintain a gold exchange standard, and the method adopted in purchasing silver in the past has not been beyond question. Only a few years ago, although the gold exchange standard was not then in operation, still the Government wanted to give effect to it, and the sale of reserve councils was condemned in many quarters.

6796. That was in 1920?—Yes.

6797. The view has been put before us that the breakdown of the system in 1920 was not due to the defect of the system itself but to a misuse of the system; in other words, the system would not have broken down then if the currency had been contracted in proportion to the amount of the reverse councils sold What is your opinion on that?—I have not thought over the matter, but it will certainly depend on the judgment of those who would be charged with the management.

6798. Generally, in that connection I am putting the case for the gold exchange standard just to see what your opinion about it is. The case for the gold exchange standard has been made in this way. If you accept the legal liability to buy and sell international currency against the internal currency at the gold points, then there is no possibility of management, interference, or manipulation of the currency by the currency authority. What is your opinion about that? Let me repeat the question: if there is a legal obligation on the part of the currency authority to buy and sell some form of international currency, whether it be foreign exchange or gold for export and so on at the upper and lower gold points, for the established ratio?—Even then there will be some management in order to maintain the ratio.

6799. Let me supplement the question in that respect thus: The case made for the gold exchange standard is that manipulation as regards the maintenance of the ratio can be avoided, and that it can be made automatic by establishing a definite ratio between the reserves against the internal currency and the value of internal currency in circulation; and, by the placing of that definite relation between the reserves and the volume of circulation upon a legal basis, you eliminate all possibility of manipulation?—Yes, manipulation would be avoided no doubt, but the reserves will have to be maintained and the size of the reserve, the securities which would be held as part of the reserve, will continue to give trouble.

6800. And all these would then become matters of statutory provision?—If everything is provided by statute, of course management will be confined within very narrow limits, but silver will have to be purchased, and the rate at which it will be purchased will be decided by the authorities charged with the duty.

6801. As long as the ratio was maintained, the circumstance of the purchase of silver could hardly be used as a medium for manipulating the currency for inflation or deflation?—That might lead to difficulty. The whole of the reserve might be eaten away if the price that has to be paid becomes high; and also if the price of gold as compared with the price of silver rises very high, there will be a disparity.

6802. If there is a sharp rise in the price of silver above the melting point of the rupee, you do not think it would affect the reserve, but it might mean that the rupee circulation would disappear into the melting pot and would have to be replaced by some other form. Is not that circumstance one which must affect any currency system which continues with the rupee in circulation?—If the rupee ceases to be legal tender, Government will not face that difficulty; if it is merely a token coin.

6803. Supposing the rupee was no longer legal tender, do you forsee any very great reduction in the actual number of rupees in active circulation? —Gradually the number of rupees in circulation will be less. It is very difficult to estimate what proportion of the rupee is in active circulation, that is to say, what proportion is not hoarded. But hoards would come out, and the rupee becomes a token coin.

6804. That is going a little far away from the question. Let us assume 150 crores as the number of rupees in active circulation. In your opinion, would that, by any proposals which you make for the abolition of the rupee as the standard coin, lead to any very large immediate reduction in the number of rupees in active circulation? I am not speaking of hoards?—Ultimately there will be less circulation?

6805. Supposing under these circumstances the price of silver rises above the melting point of the rupee, what is going to happen then?—If the rupee ceases to be legal tender there will be no harm in reducing the silver content of the rupee.

6806. Would it be any easier then than it is now? —It will be much easier: now the rupee is legal tender.

6807. Theoretically of course since we are taught that the rupee is a note on silver there is no reason why we should not reduce the bullion content of the rupee. What prevents us is the violent reaction which will be produced upon the sentiments of the uninstructed population?—Yes.

6808. Would the reaction be any less violent, even after the rupee had ceased to be legal tender, if it is still in wide circulation?—It ought to be less violent.

6809. We might hope that it would be less violent?—Yes.

6810. Let me summarise the questions as regards the case for the gold exchange standard which I have been putting to you by asking you whether, in your opinion, with these improvements in the structure of the system so as to make it a scientific standard, there would be any greater opportunity for the manipulation of such a standard than there is for the manipulation of a full gold standard with a gold currency, recognising that there must always be a note issue with the supplementary gold currency? —It seems to me that the possibilities of manipulation would be much fewer but the exact extent to which manipulation would be possible is more than can be prophesied just at present.

6811. It becomes then a matter upon which you do not express a definite opinion?—It is a very difficult matter. The objection to a scientific gold standard would be much less than to the gold exchange standard which existed before the War.

6812. At the end of your paragraph you say: "The gold exchange standard is regardod as the brand of subjection and inferiority," which I confess is a shaft which pierces my bosom, because have we not in England just adopted a standard which is in substance the gold exchange standard?—At the present moment.

6813. Yes, at the present moment?—If that be called a gold exchange standard I should have no objection to having it here in India; but certainly

portions of the present procedure are regarded as temporary, as leading up to a full gold standard and the prohibition in the export of gold has now been removed. So in England they are really returning to the real gold standard.

6814. Our currency is internally inconvertible?—Yes, but that is only temporary. It is not likely it will continue to be so for ever.

6815. Here again we get into questions of foresight upon which we can express no positive opinion?—The Treasury Committee recommend that for the time being it should not be convertible, but they don't say that it should not continue to be so always in future.

6816. Would you be surprised to learn that there is, I think, no opinion in England in favour of the return to internal convertibility, and that I do not think any practical men forsee such a return?—I accept your statement.

6817. It would not be a surprise to you to learn that?—Well, even if it is so, that would not make much difference because in England the people have become accumstomed to a system of currency which is not exactly the same in India. For instance, the use of cheques and other forms is more prevalent there than in India, and when the same habit grows in India a scientific gold exchange standard or international gold exchange standard may become possible.

6818. You have relieved me; you have enabled me to read the sentence about the gold exchange standard being a brand of subjection and inferiority to mean that the gold exchange standard may be regarded as the brand of experience?—But this view has been expressed by eminent writers of books on finance and currency, that the gold exchange standard is suitable only for subject nations.

6819. That was not the view of the Genoa Convention, was it?—No, it was not.

6820. The recommendations of the Genoa Convention may perhaps have done something to relieve this particular system from any brand of inferiority?—Yes.

6821. Now we come to the alternative standard. You dismiss the managed currency as unpractical, and, of course, we understand that it is in direct opposition to your view as to the desirability of a system with possibilities of manipulation in any form; and we come to the gold standard with a gold currency?—Yes, but I do not object to an international exchange standard provided all relations are on the same footing and the habit of international action becomes established.

6822. You look forward to that as an ultimate ideal?—Yes.

6823. When the nations of the world agree?—Yes.

6824. "An incidental advantage," you say in the third paragraph towards the bottom, "of the adoption of the gold standard will probably be that greater familiarity with gold coins will bring into use such quantities of gold as are now kept as a store of value in the shape of ornaments or lumps of the yellow metal." This is a most important consideration, and perhaps you could tell us from your experience upon what you base this opinion?—It seems to be psychological more than physical; when people become familiar with an article they do not want to hoard it; if they know they can get it at any moment there won't be the same motive for hoarding it as at present.

6825. The case one has to meet in support of this opinion is this, that from time immemorial the people of India have looked upon the possession of gold as one of the objects of acquiring wealth; that, as it has been put to us by one witness in evidence, it is impossible to saturate India with gold owing to domestic uses and this taste of the people for gold. If that be so, is it safe to assume that, in the course of even a generation or two, a greater familiarity with gold coins will content the populace and make them no longer desire to have gold when we are dealing with such an age-old habit?—The psychology of the matter is that people desire a thing which is not very common, which is rare. Onee a thing becomes common, people do not want to hoard it. And, secondly, when banking facilities increase in India the hoarding habit itself will diminish, and perhaps in the long run disappear.

6826. Then you are contemplating the putting of so much gold into circulation as to make it really a common object in the eyes of the people?—Yes; if they can get gold without much difficulty they will not show any propensity to hoard it.

6827. What is you view upon the lessen to be learnt from the experience of efforts to make gold circulate in India in the past, as, for instance, after the report of the Fowler Committee?—I am not in favour of taking active measures for the circulation of gold. Once gold is made available let people take advantage of it, but I am not in favour of making payments in gold from the Post Office and Treasury, because that again has a definite psychological consequence; when people find that a thing is being forced upon them they do not want it; they look upon it with suspicion.

6828. Do you or do you not consider that, as the result of the measures which you propose, a substantial amount of gold would pass into circulation?—A substantial amount would be in circulation, but I would not force gold into circulation.

6829. You do not consider that a probable consequence of the result of making gold available for circulation would only mean the rapid passage of gold into hoards, ornaments and other forms of supplementary use?—No, I do not apprehend that difficulty.

6830. "The adoption of the gold standard," you say in the next paragraph, "does not imply that gold coins must necessarily circulate very largely." I just want to put this to you to clinch the little difficulty which I have been feeling about your recent answers. If gold is to educate the people not to hoard according to your view, it must circulate substantially?—Substantially but not very largely.

6831. If gold circulates substantially then it is expensive. One cannot have it both ways. Either you must be prepared to foot the bill for teaching the people that gold is a common object, or, if you want to economise, then you won't get the benefits of this lesson?—I would take a middle course. I would not force gold into circulation. I would make it available and the result of that would be there would be some circulation of gold, but not necessarily a very large circulation, because the people of India are poor, and the masses would not be able to get any amount of gold; it would be mainly the middle classes that would be able to get it.

6832. Nevertheless we must put it in this way, must we not, that your lesson not to hoard must be expensive precisely in proportion to its efficiency, since its efficiency depends upon the amount of gold in circulation?—Well, yes. On the one hand, when people get gold whenever they want it they will not requiro to hoard it. On the other, some amount of gold will be needed in order to familiarise the people with this metal; so some amount of gold will be required, but I do not think it will be a very large amount.

6833. Now let us look and see what amount of gold will be required. Have you been able to form any estimate of that?—No; I have not been able to do so.

6834. Nevertheless that is a very material question?—It is a material question, but estimates are bound to he very rough, and I have not found it possible to arrive at any exact estimate.

6835. The feasibility of your proposal depends, I suppose, (a) upon your being able to get enough gold to carry it out, and (b) upon the expense involved?—Yes.

6836. Therefore a judgment as to whether it is feasible or not must depend upon the formation of an estimate as to what amount of gold is likely to be required?—Yes. Broadly speaking, I may say that it is not impossible to obtain a figure of the amount of gold that will be required for the purpose.

6837. How can one tell that until one knows how much gold is going to be required? Supposing it was

500 millions sterling?—That will have to be carefully worked out; but my own estimate (I say this with a great deal of diffidence, because I do not think I have the proper materials to form this estimate) is that it will be something like 80 to 100 crores.

6838. Let us assume it at that. Every estimate, of course, must be formed with the utmost diffidence, but the most carefully calculated estimates put before us have been somewhat bigger. However, for the purposes of the present discussion, let us assume the larger of the figures you mention, namely, 100 crores?—I would regard that as a safe amount.

6839. Please tell us how, in your opinion, India would acquire this additional 100 crores of gold?—India has a large balance of trade annually, and if we look at the figures of the import of gold we find that it will not be at all difficult for India to get 25 crores worth of gold a year; so if the establishment of the gold currency takes five years, it will not be difficult to get something like 100 crores.

6840. India undoubtedly has a large balance of trade. A part of that balance is settled by the payment of the home charges?—Yes.

6841. Part by other invisible imports and part by the importation of gold bullion for ornaments and domestic uses?—Yes.

6842. So that, as a matter of fact, the whole of the balance is accounted for in one way or another. Where are we to find the credits on which India is to get the additional 100 crores of gold? I mean, what is the mechanism?—If you establish a gold mint at Bombay, and if there be a statutory provision to the effect that whenever gold is brought to the mint for coinage it will be allowed to be coined, then the public will take gold to the mint; the Government will not have to mint these coins of its own accord, to any very large extent; but it is the public who will bring their bullion to be coined.

6843. Why should the public be concerned to import more gold than they do at present? Supposing enough gold is imported for them to meet their domestic requirements, what measures are we to take for more gold to be imported, and against what credits?—A large portion of the gold that is imported at present will go to the mints for being coined.

6844. What is the basis of that opinion? We recognise, do we not, that in the last few years there has been a very great and exceptional import of gold owing, as we have been told, to the circumstance that gold is cheap in comparison with other commodities?—In the pre-war years of 1912-13 and 1913-14 the importations were very large too.

6845. There are indications which have been given to us by experts in the bullion market that the exceptional demand for gold has now been satisfied, and that for the future we should only expect a normal demand for gold for domestic purposes, ornaments and so forth. That being so, and having already agreed that the apparent balance of trade is really covered in one way or another by various forms of import, is not some further measure necessary in order to secure an increase in the import of gold to meet the new currency requirements?—Government will have to invest a small portion of the gold standard reserve in the coinage; but I do not think a very large amount will be needed.

6846. They could sell the securities in the gold standard reserve and take it in the form of gold?—Yes.

6847. That is one way?—Yes.

6848. If that goes into currency, then the reserve must be restored in some other form of asset, must it not?—Yes.

6849. Unless we assume that the reserve is now too big?—Once a gold standard is established very little reserve will be needed.

6850. I will ask you about that later. Would you disagree if it were put to you that, in some form or another, in order to supply the additional gold which will be required for the introduction of a full gold standard in the country, the Government of India will have to raise credits by borrowing at some gold centre in order to secure, either directly or indirectly by the rate of exchange, an additional import of gold?—Some borrowing may be necessary.

6851. And it is in the form of the interest upon those further credits that the expense of the scheme will come home to roost?—Yes.

6852. Now, let me put against your figure rather a bigger figure, which has been supported by evidence before the Commission, the figure that the requirements of India for a fresh supply of gold will amount to 100 millions sterling, not 100 crores of gold metal. You say in paragraph 11: "But in reality such absorption, if it takes place, will prove beneficial to the rest of the world, as it will help to lower the international price-level." That may be; but what we want to assure ourselves is that this will be beneficial to India, and in this connection I want to refer you to the possible effects which such an absorption by India will have upon general gold prices. What degree of disturbance do you think it would effect?—I do not expect that it will lead to much disturbance.

6853. Let me make my question quite clear, and ask you to assume that this process will be spread over a reasonable number of years, and that it will not occur all at once?—If it is spread over a number of years, I do not expect that there will be much disturbance. Of course, the absorption of some amount of gold by India will cause some shortage in gold in other countries. But that will not be so when it is distributed among the various countries; it will not affect very much the price-level in any particular country, and although there will be a slight lowering of the international price-level, that will be all to the good.

6854. Why will that be all to the good, a lowering of the world's gold prices? Does a fall in prices usually promote trade as a whole in the world?—It is a very complex matter; a rise in prices, of course, gives a stimulus to industries and industrial development, it is true; but, on the other hand, we must remember the fact that the price-level in the world at the present moment is much higher than the pre-war price-level. Taking the pre-war price-level, we have 160 as the index number for the United Kingdom, practically the same number in the United States, and in some of the other important gold-using countries. In India it was practically the same, 160. Now, this price-level seems to be abnormally high, and if there is a slight lowering there will not be much harm.

6855. Can one speak of a price-level as being abnormally high absolutely or abnormally low absolutely?—No; not absolutely; but compared to the pre-war figure.

6856. What is meant by abnormally high? It is higher no doubt than before, but is that of any significance after a period of adjustment during which wages, salaries and so forth have adjusted themselves to the new price-level?—No; it does not matter much; but even if there is a slight lowering of the price-level that would not cause any harm.

6857. In forming your opinion that this withdrawal of gold to India would not materially affect world prices, you have no doubt taken into consideration the probable future relation between the world supply of, and demand for, gold?—Unless there is any change in the present rate of production there will be no difficulty. Of course the price of gold like the price of any other commodity depends upon the production, that is the supply, and the use that is made of it. Now, of course, if the production of gold decreases, then there might be greater shortage, but if there is no appreciable decrease in the future production of gold then the slight amount of existing stock of gold which will be absorbed by India would not greatly affect the world's turnout.

6858. It is estimated by competent authorities, is it not, such as Professor Cassell and Mr. Joseph, that the world requires an annual increase of 3 per cent. in its total output of gold in order to keep pace with the increasing demand and to maintain prices stable?—Yes.

6859. In view of that circumstance and of the amount of the present production of gold, would you think it is safe to assume that an additional demand

of this magnitude for India's use might not produce an effect upon world gold prices which would have a very disturbing effect—I don't say upon the world at large—that we may disregard—but upon India itself?—I don't apprehend that. We don't want to disregard the world as a whole, but still, if the disturbance is distributed over the whole world, it will not really be felt. And if we consider the interests of India herself, of course, I don't think there will be any great harm done to her.

6860. I want to put to you a question which suggests itself to me now as the result of this discussion as being one which needs an answer. Supposing that the authorities at the world's gold centres, New York and London, were to take an opposite view, and to hold that such a demand would create a disturbance which would be adverse to the interests of the world at large and India amongst others; in view of the circumstance that, as we have agreed, to obtain that gold, India must raise foreign credits; contemplating it under those circumstances, if the authorities of these centres were reluctant to grant such credits, how could India enforce this policy?—That would be extremely selfish on the part of the United States and England. They keep hoards of gold and they would not allow any other nation to absorb a portion?

6861. Is it necessary to assume that it would be selfish? Might it not be that they differed from the view which you have taken that it would be in the interests of India? They might say: "No, our acquaintance with the conditions of the world's gold markets is such as leads us to believe that this would cause such a dislocation of prices as would do great harm to India and therefore we are not prepared to assist India to take a course which would be adverse to herself." The question is, under these circumstances, if credits are necessary, how could India make good the establishment of this policy?—In case there is such an obstructive attitude on the part of some nations, India would have to teach her people not to put gold into industrial uses or into ornaments but to keep it apart for the currency, the amount which she gets in the usual course of trade.

6862. India would then have to fall back upon what I have no doubt you would say is a slow process?—Yes, it will have to be slow.

6863. That process would be the process of the education of the Indian people up to making a better use of their gold than putting it into hoards?—Yes.

6864. Is that process now going on or is it not? Are the people of India being educated to the use of notes and to the more productive use of gold?—Yes; the use of notes is rapidly increasing.

6865. If the use of notes is rapidly increasing, might not that, in the course of time, produce these results which the gold currency would be intended to achieve, that is, the habituation of the people to confidence in some other form of storage of value than gold and the release of gold for investment?—Well, it is possible, as I said before, that such a time will come, but the people of India must have confidence in other nations and the habit of international action must be established. Otherwise, so long as India remains in the position which she occupies now, I think it would be desirable to have a gold standard so that she may think that in currency matters at least she is independent.

6866. What is the greater independence with a gold currency rather than with an exchange standard?—Until you have no international gold exchange standard, in the words of Sir Basil Blackett you have to tie yourself to the chariot wheel either of the Federal Reserve Board or of the Bank of England.

6867. Is that necessarily so with a perfected exchange standard? Supposing your exchange standard were the same as we have in England, where gold is freely given for export, not foreign exchange but gold bullion for export, does that not make you independent of any foreign currency?—Yes, but somebody must manage it; management cannot be altogether avoided. And so long as there is any management, there will be suspicion in the minds of the people.

6868. We get back then to the question we have already examined as to the relative degree of management in an exchange standard and an internally convertible standard with notes. In your next paragraph we come back to the ratio, and you say: "this brings us back to the question whether the exchange ratio is a natural one or an artificial one?" I want to ask you just what the words "natural" and "artificial" connote. What is a natural and what is an artificial ratio?—Well, Sir Basil Blackett said in one of his budget speeches that there is no such thing as a natural ratio. But a natural ratio may be regarded as one which is established as the consequence of normal circumstances—that is to say, without any manipulation—which establishes itself in the normal course of things, the usual trade relations and so forth, and not as a result of any manipulation.

6869. Let me put this to you. If one really gets to the bottom of it, that ratio alone can be said to be natural which is a ratio between the internal currency and gold or some external currency, such as sterling or international currency, to which internal prices have adjusted themselves?—The only natural ratio would be really the result of the comparative price levels in different countries; internal price level as compared with external price level. And as I said that would be established in the natural course of things and not by means of manipulation.

6870. The exchange rate is really only the measure of the relative value of the currency and, say, gold?—Yes.

6871. And when that measure is one which expresses the relation between the internal prices and world prices, then it is the natural ratio?—Yes.

6872. Any other ratio which does not express that relation between external and internal prices is an artificial ratio?—Yes.

6873. In your opinion have Indian internal prices adjusted themselves to the present ratio of round about 1s. 6d. or have they not?—I do not think they have adjusted themselves to the present ratio, not to the full extent.

6874. Admitting the difficulty of ascertaining evidence upon this proposition, to what evidence do you refer in support of that opinion?—I cannot refer you to any evidence, but my view is that the internal price level of India at the present moment as compared with the international price level is practically the same as it was in the year 1913-14. Now if that be so, the present rate of exchange seems to me to be high.

6875. I am afraid I do not quite follow that. The only direct evidence that I know of is such index numbers as we have in India, and, in particular, the Calcutta Index number?—The index number in India may be taken as 160. Practically it is the same in England. The figure given by the Board of Trade is somewhat less, and the figure given by the Economist is somewhat higher, but taking the mean it is about 160, and that is the internal price level in India.

6876. If the internal price levels in India are practically the same now as world prices, in England, say, and other gold standard countries, does that not show that they have adjusted themselves to the present rate?—In that case I do not see why the exchange should not have been the same as before the war, that is, 1s. 4d. If the internal prices were comparatively equal now and before the war, I do not see why the pre-war rate should not prevail, that is 1s. 4d.

6877. Let me put it this way: if there is a substantial equality indicating an adjustment, supposing we adopted in India any other rate than 1s. 4d. or 1s. 8d. does that not mean that there will have to be adjustments in Indian prices in order to accommodate them to the new rate?—Yes, there will have to be adjustments, but we should also consider whether the present rate is the result of factors which are

permanent or of factors which are only temporary. If we find that as a result of three or four successive good harvests, the present ratio has been reached, and if it is possible that we have one bad harvest in every three, if that be the normal condition in India, we should not expect to be able to maintain the ratio at 1s. 6d.

6878. Or, a critic might say, at any other rate, once there had been an adjustment to that new rate?—Yes.

6879. Such disturbing circumstances as those to which you refer would inflict an equal strain upon any rate that had been established and to which prices had adjusted themselves?—Yes, until prices have adjusted themselves, there would be disparities.

6880. The point is that the strain which the disturbing factors to which you refer, the bad year or we may say shifting world prices, would impose would fall with equal severity upon any established rate, the established rate being the rate to which Indian prices and Indian currency had adjusted themselves. We must here look to adjustments which are more or less permanent. The question is whether these adjustments which we have at the present moment are permanent or only temporary. In fact we may doubt whether there have been permanent adjustments or not. We have not quite exhausted that topic. Let me ask whether there is any other positive evidence to which we can refer to satisfy ourselves on this question whether there has or has not been an adjustment of Indian prices to the existing rate of 1s. 6d.?—There is another matter. The ratio of gold to silver in September last was, in New York 28·8, in London practically the same 28·7, while in India it was 29·6. Now so great a difference between the ratio in India and those in New York and London seems to point to the artificial value of the rupee. In the usual course of things, the ratio in India ought to approximate to the ratio in London and in New York. There ought not to be much difference.

6881. Do I understand that you are referring to the price of silver as the price of one commodity which in India has not yet adjusted itself to the 18d. rate?—Yes, the price of silver as compared to the price of gold is not the same in India as it is in London or in New York.

6882. It would no doubt require a greater acquaintance with the silver market at any rate than I can have to understand why there should be any temporary maladjustment of this commodity, but the circumstance that there is a single commodity (which is not, after all, a commodity of basic importance in considering the cost of living and so forth) that shows a temporary maladjustment here and there is not of very great significance in showing that there has not been a general adjustment?—A single commodity is not of very great importance that is perfectly true. But when we take into consideration the fact that silver, unlike other commodities, is one of the main articles which constitute the currencies of several countries, particularly in India, we cannot ignore it altogether.

6883. The only significance from the point of view of a disturbance of the rate of exchange would be if the price of silver were to rise above the melting point of the rupee. The price of silver is now 33d. and I think the melting point of the rupee at 1s. 6d. is 48d. That still provides a very ample margin, does it not?—It does provide a margin, but I was considering the comparative prices of silver and gold. So far as I am concerned, as I say in this memorandum, I am not quite certain that the present ratio has been worked up to. But I have grave doubts in my mind as to whether the present ratio may be regarded as a safe ratio which is maintainable.

6884. I am not sure that we have exhausted yet the circumstances upon which you base that opinion. Are there any others which you think support that opinion? We have considered the index numbers and the price of the commodity, silver?—The fact that during the last three or four years we have had exceptionally good harvests, which has led to an increased demand of the currency—as a rule we do not have such good harvests year after year in India.

6885. That perhaps rather returns to our discussion upon the question whether one rate after adjustment is more especially maintainable than any other, on which we already have had the advantage of ascertaining your views. Then you say: "If this ratio be adopted, measures may become necessary to check any downward tendency of the rate that may show itself. This can be secured by a cessation or restriction of the rupee coinage and reduction in the volume of the notes in circulation," and so on. How would you get to 1s. 4d., since we are now at 1s. 6d.?—The mere announcement that India is going to adopt the gold standard will reduce the value of gold.

6886. And will reduce the value of the rupee no doubt?—Yes.

6887. That will be because those who hear the announcement assume that the currency authority is going to take the measures necessary to reduce the rate to 1s. 4d. Supposing no measures were taken, do you think the rate would stay at 1s. 4d. after the initial fall owing to the operations of speculators and so on?—If my argument be correct that the present circumstances are not permanent but are merely temporary, then there will be no reason why the rate should not stand at 1s. 4d.

6888. That is assuming that the price levels in the country at the present time are really adjusted to the 1s. 4d. rate?—Yes.

6889. Then I understand it is your proposal to make the rupee convertible into the gold mohur as soon as possible. What exactly would be the nature of your proposals as regards that? How would you proceed practically?—I have not thought out the different stages but some time will elapse before a full convertibility is established. My view is this, that as soon as it is found practicable to convert silver into gold, it would be desirabe to do it.

6890. What would the effect of this announcement be upon the holders of rupee boards?—They will perhaps want to have their silver converted into gold.

6891. Would you undertake the obligation to do it at once and, if not, by what stages?—At once it will be impossible, because the gold standard reserve is invested wholly in securities at the present moment. We have 40 millions, but the whole of it is invested and if we want to have the whole of it converted into bullion, into gold, that would result in much loss. But I do not think a very large hoard of rupees will immediately come up for conversion. The amount of rupees that are in actual circulation will not be converted. In some parts of the country where banking facilities are non-existent and where people do not invest in any other securities, there of course are considerable hoards. For instance in Northern India, and to some extent in the United Provinces and the Punjab. But the extent of these hoards has not yet been estimated, and I do not know what is the actual extent of those hoards. In Bengal my impression is that there are very few hoards, so that if these stocks of rupees come back to the Government for conversion, it will not be a very difficult matter for Government to meet the obligation provided the Government gets sufficient time. In the course of two or three years it can be done. But immediately of course it would be very difficult to give effect to it, because the gold standard reserve is at present invested in securities, while if it had been held in gold, there would have been no difficulty at all.

6892. The whole scheme might then have been given effect to almost immediately, your difficulty being the realization of the securities in the gold standard reserve?—That is one difficulty. The scheme of convertibility,—that might have been given effect to immediately if the gold standard reserve had been held entirely in gold.

6893. Would the gold standard reserve be adequate for your purposes? You have got to contemplate the ultimate conversion of all the hoards of rupees?—As I said, I do not know if any estimate has ever been made of the hoards. I do not know personally what is the amount of the hoards.

6894. Let me give you the best estimate that has been supported before us in evidence, and that is an estimate of between 100 to 150 crores. Our gold standard reserve has only got 53 crores, that is 40 millions, or whatever figure we may take it at. If that be so, the gold standard reserve would not alone be adequate to undertake these liabilities?—Here again I speak with the greatest diffidence. My own estimate is that the hoards would not be more than 100 crores, probably considerably less. If the gold standard reserve had been held entirely in gold, 40 millions in gold or 53 crores if you like, would not have been at all inadequate to meet the whole demand.

6895. On the one side we have your estimate of 100 crores of final redemption, quite apart from any gold in circulation, and, on the other side, 53 crores in the gold standard reserve?—We are considering the amount of loss.

6896. There are 100 crores of rupees against which you have got to give gold, that it, 100 crores of gold. I beg your pardon. We are not considering the loss but the actual amount of gold required, which is quite a different proposition?—As I said a few minutes ago, in my opinion 100 crores is an over-estimate and 70 or 75 crores would be perhaps a safe figure. But even taking 100 crores as the figure of the hoard we do not expect the whole amount to be presented for conversion immediately; when people will continue to use rupees, I do not apprehend that the entire amount of the hoard will be presented for conversion.

6897. At any rate, you would limit that by undertaking only a limited obligation to give so much gold per annum?—Yes, that would be necessary in present circumstances but if the whole of the gold standard reserve had been held in gold it would not have been at all difficult to meet this obligation immediately, because if we take one half of it as being likely to require conversion 53 crores would have sufficed.

6898. There is another consideration, is there not in this connection, in estimating the amount, that is, when the rupee ceases to be legal tender, and is dethroned from its position as a standard coin, you can no longer hold silver in your reserves. The silver of the reserves must, therefore, be replacd with some other asset, with gold?—Yes.

6899. Which again is a factor to be considered in estimating the amount of gold to be required?—And that cannot be given effect to immediately; that will be a question of time.

6900. It also raises a further consideration. The expense of the scheme has got to be met, as I suppose you would agree, by the sale of the silver presented against gold and by the sale of the silver now in the Government reserves, something like 100 crores?—Yes, but if the whole of the silver is placed on the market immediately it will fetch very low prices and therefore it will have to be done gradually.

6901. What degree of gradualness would one have to adopt in order to prevent this throwing on the silver market of some 200 crores of silver from producing a slump in the silver market which would seriously affect the cost of the scheme?—I have not very carefully estimated the matter but I think 4 to 6 years will be required to give effect to the whole scheme of the gold standard.

6902. The amount of silver involved is, we are told, some three times the world's whole annual production of silver. Do you think this could be absorbed in 6 years without having a very serious effect upon the price of silver?—It will have some effect but not a very disastrous effect.

6903. Is it the experience of any other market that in 4 to 6 years you could add three times the whole supply of the world to that market without having a very serious effect on the price?—Distributed over 6 years that would mean considerable loss but the loss would not be of a disastrous character. If necessary it might be distributed over a longer period.

6904. There are one or two questions upon other matters in your memorandum that I would like to ask you. In paragraph 17 you express the opinion that the Government of India should continue to control the note issue, as I understand it, until the establishment of a State Bank in India. Could you expand that a little by telling us precisely what the conditions are for this State Bank, and in what respects they differ from the present constitution of the Imperial Bank?—Well, I am not satisfied with the Imperial Bank as it stands at present.

6905. What are the essential conditions in tho reconstruction of the Imperial Bank in order to make it such a State Bank as would meet your requirements?—The present Imperial Bank occupies a somewhat anomalous position. It may be said that the Bank of England is also in an anomalous position, but the history of the Bank of England is different from the history of the Imperial Bank. In England Government required a sum of money and the Bank of England advanced this money and the Bank began to act as the State Bank, performing many of the functions of such a Bank. In India on the other hand the Imperial Bank did not lend any money to Government, but gets the use of Government monies and the profit goes to the shareholders. It would be desirable to have a Bank like the Alliance Bank of Germany or some similar institution, or the constitution of the Imperial Bank may be so changed as to ensure the interests of the people of India being safeguarded.

6906. That is your object, as I understand it, but we have to make practical recommendations and to consider how that object can be attained as regards any possible changos in the constitution of the Bank. I thought perhaps you eould guide us on that point?—I am sorry I have not considered the details but I do not regard the present position of the Imperial Bank as an ideal one and I have always been of opinion that a State Bank proper should be established in India.

6907. I am a little afraid of being content with mere nomenclature in this matter. I feel that it is important for us to get at the root of the difference between the Bank you have in mind and the present constitution of the Imperial Bank. For instance, is there, in your opinion, not sufficient representation of tho Government in the control and management of the Bank at the present time?—Well, that is one point.

6908. And, if so, in what way would you increase it?—I have not thought over that; and not only of the Government but of the people. By people here in India we mean an incongruity. In other countries the Government represents the people; here in India the Government does not as yet wholly represent the people and that is the effect which has to be taken into consideration. But we expect that in the near future the State will be wholly representative of the people and in that case this difference between the State and the people will disappear. Then there is also this difficulty. Some shareholders are Indian, others are non-Indian, and the interests of the two communities may not always coincide. If there were a properly constituted State Bank this difficulty would be obviated.

6909. By what measures?—As I told you I have not thought out the details which would be necessary in order to convert the Imperial Bank into a State Bank.

6910. In your last paragraph but one you say "The seasonal demands for currency would be met to a larger extent in the future by the free minting system under the gold standard." It is not obvious to me at first sight how a free minting system can assist in any seasonal demands for currency, for this reason, that a free minting system means that the currency of the country is increased by the import of gold in the course of time, after the maturing of the

balance between the exports and the imports. Does that not come at a period after the read demand for the seasonal currency, which is before the actual export and before the conditions of the balance acting upon the exchange have resulted in the importation of gold; and is it not (just to show you the point of my question) the experience of other countries, such as pre-War England, that, as a matter of fact, the mere mechanism of the import and export of gold is perfectly useless to give any elasticity whatever to the currency of the country, and that we do require special provisions under that system just as much as under another to anticipate the gold movements?—That is correct. It is true that when agricultural products have to be purchased, the amounts have to be paid then and there; but for this purpose foreign capital can come in. Those who want to purchase goods in India will then bring in foreign capital in order to assist this need for the purchase of agricultural products.

6911. How does that foreign capital become currency in order to assist in financing the crops for export?—There is a constant flow in and out of goods and we can say that only at a particular moment there is an export of goods. Exports continue always and in view of crops being sold gold may be imported into India in order to pay for these agricultural products. That is quite possible and this gold would be minted.

6912. I understand that gold will be drawn in by the excess of exports when there is need for it. Is not that just the point, that the general movement of trade constantly in progress affects the import or export of gold without any relation whatever to the periodical seasonal fluctuations in the demand for seasonal currency at a precise time of the year to finance the internal movement of the crop before it is exported, so how can we get any help on this question of the provision of seasonal currency by adopting one basic system of currency rather than another?—I do not say that the whole of the difficulty will be obviated; I say that it will be obviated to some extent. If you have gold imported, this gold can be minted and that will pay for the agricultural produce. The whole of the difficulty will not be obviated entirely.

6913. As I understand from the second half of your paragraph, you do not think it will be possible without the same sort of provision that you have at present for meeting seasonal demands?—Yes; some need will always be felt; the existing method of creating additional currency will have to continue; I only say that a gold currency will meet the demand to a larger extent than now.

6914. That brings me to the end of the leading questions which I wanted to ask you. I wonder if you would be good enough to deal with any supplementary questions which my colleagues may have to ask you?—With pleasure.

6915. (*Sir Purshotamdas Thakurdas.*) In paragraph 10 of your statement you say: "In fact with a gold currency gold is likely to be used only to a very limited extent." If with a gold currency gold is likely to be used only to a very limited extent, why do you anticipate such a large amount of rupees to be tendered to the Treasury to be converted into gold?—Only a portion of the hoards would be tendered to the Treasury for conversion.

6916. You do not expect that what is actually used at present as currency will be tendered?—No; I think I made that clear.

6917. You only expect the rupees which are in hoards to be tendered for conversion into gold?—Yes; and not the whole extent of the hoards even; only a portion;

6918. Of course you have told us that you do not happen to have any figures of rupees in hoards?—No. But my rough guess (I shall not call it an estimate) is 70 or 80 crores.

6919. You mean rupees which are in hoards and which have not been converted into gold till now?—Yes.

6920. That in spite of the knowledge that the rupee is a token coin and is only of ten annas value?—Ten or eleven annas.

6921. Why do you think that people are sitting on such rupees in their hoards still?—The rupee being the legal tender coin it is kept as a store of value by people who expect to use it in future in places where there are very few facilities for investment or very few banks.

6922. In spite of being aware that practically six annas in the rupee is lost the people retain the rupee in hoards because it is a current coin?—Yes.

6923. If that is the mentality of the people who keep coins in their hoards despite the fact that they know there is a loss on it, is it not very likely that all those who have in their hoards gold bullion will tender the gold bullion to the mint to be converted into gold coin?—Yes.

6924. And in view of the large imports of gold in later years to which you yourself refer, is it not likely that much more gold may be tendered to be converted into coin at the mint, and that the currency may get a very good start with that?—Yes; I think I mentioned, in answer to a question of the President, that a portion of the gold which is now held in the shape of ornaments or in the shape of bullion may be presented to the mint for coining.

6925. My point is this: do you expect that it would be presented in very large quantities, in fact, as much as can be spared from the hoards will be thus presented for conversion into coin?—Yes, I believe so.

6926. Because if people hoard a coin, knowing that it is six annas less than its face value, they would certainly prefer to hoard a coin on which they know there will be no loss at all?—Exactly.

6927. You told us that according to your impression there is not much hoarding of the precious metal on the Bengal side?—Not much.

6928. I suppose that information of yours relates to the people?—Yes; let me explain my position; so far as the poorer classes are concerned there are not many hoards; they have a few silver ornaments, but so far as the middle classes are concerned there is some amount in the shape of ornaments, but not much in the shape of bullion.

6929. Ornaments which are necessary for purposes of their social and religious customs?—Yes.

6930. That could not be called a hoard as long as they are ornaments which are more or less necessary?—On the Bengal side there is not much hoarding.

6931. I was thinking more of the Zemindar and the richer classes and of the landed aristocracy. Do you think they have large hoards?—Not in Bengal; very little in Bengal. In the United Provinces and the Punjab there are some hoards.

6932. Would you say that if there are any impressions about the richer classes and the landed aristocracy in Bengal having precious metals in hoards, you are not disposed to support that impression?—I am not.

6933. May I ask if in the ordinary course of your duties you can be said to be in intimate touch with the rural and urban areas in Bengal?—I am in some sort of touch with the rural areas, and of course I live in the city of Calcutta.

6934. And you have opportunities of knowing the condition of the landed aristocracy in Bengal?—Not very intimately, but to some extent.

6935. I want to ask what you mean when you say that the Imperial Bank holds an anomalous position; excepting what you said to the Chairman, is there any other point that you had in your mind when you made that statement?—It seems to me that the Imperial Bank does not enjoy that measure of confidence in the minds of the people which it ought to.

6936. Regarding its solvency?—No.

6937. Then regarding what?—Regarding how far the interests of the people would be safeguarded by it, monetary and other interests.

6938. Monetary interests? How far are they safeguarded by the Imperial Bank at present?—Not at present; I would not entrust any large functions; that is what I said.

6939. So that if the present constitution of the Imperial Bank, whereby the Viceroy nominates six out of the twelve Governors, continues, you do not think

that would inspire enough confidence?—At the present moment, as I said, the Government of India is not representative of the people; when the Government of India becomes really representative of the people a greater amount of confidence will be established.

6940. And you want currency change to be made forthwith? You are not putting it off until the Government of India are representative of the people?—No; but I would still prefer a State Bank to the present system.

6941. Despite the fact that the Government of India is not likely to be representative of the people in the next year or few years, you prefer a State Bank to a bank where half the number of Governors are non-officials?—Yes.

6942. Would not that appear a little contradictory, if I may say so?—No. When I say that at present the Government of India is not representative of the people I merely mention the fact that this is one of the circumstances which leads to the want of confidence by the people; that will disappear.

6943. Perhaps the most important circumstance?—Yes.

6944. I am tackling the same subject; you say that the people have no confidence in the bank because the government the head of which nominates six out of the twelve Governors of the Bank does not happen to be responsible to the people; there is no prospect of the constitutional aspect changing within the next one, two or three years. You are now putting before us a scheme for a reform of the currency policy within the next one or two years?—Yes.

6945. And you still suggest that instead of having a bank where half the number of Governors are non-officials you prefer a bank where the complete control is in the State?—Yes; I am sure that in the near future the Government of India will become representative of the people.

6946. In the near future?—Yes.

6947. Then your recommendation is based on that? —In any case I would prefer a State Bank.

6948. May I take you step by step? I find it rather difficult to follow what you say. I want to understand exactly what you have in mind. You want a State Bank because you want the control to be with the State?—Yes.

6949. And you say that the State at present, in the constitutional stage at which the country is, is not responsible to the people?—In answer to that contention, I maintain that the Government will soon be representative of the people.

6950. Therefore, your recommendation for a State bank is based on this assumption on your part, that there will be a substantial measure of advance in political reform in the near future?—That is my belief.

6951. But, if that was not feasible you would certainly not make this recommendation? You would be disappointed in having made that recommendation? —Yes.

6952. (*Sir Norcot Warren.*) You said just now that the Imperial Bank of India got the Government balances free?—I say they have the use of the balances.

6953. Do we not do anything in return?—The Imperial Bank does perform certain functions for the State.

6954. Do we not do the whole of the treasury work for nothing?—It does perform some functions.

6955. Some functions?—Some important functions.

6956. All the functions of the treasury?—Yes.

6957. You cannot do that for nothing?—I agree that otherwise it would involve some expense.

6958. Some expense? I put it to you that it would involve double the expense that it does if we did not manage the treasury?—Possibly. I have not calculated the expense.

6959. Well, I have; I know it. Secondly at the instance of Government we have opened a hundred new branches very nearly; they will be completed on the day appointed *i.e.*, the 27th January next. Most of those branches will not pay for years?—In the beginning they will not pay.

6960. Is that not a loss?—That would be a loss to the Imperial Bank.

6961. To the shareholders?—Yes.

6962. You are talking as if the shareholders were getting everything and the Government getting nothing?—I did not exactly say that.

6963. I say the Government get 50 per cent. and the shareholders the other 50 per cent. If Government paid us interest for the work that we do for them it would be cheaper for the Bank than the present arrangement of getting their balances free?—It may be so.

6964. I am sure of it?—You are in a better position.

6965. Of course I am. Then again besides that, recently, when the presidency banks were in existence we charged anything we liked for remitting money all over the country. At the instance of government these charges are now so reduced that there is a great loss to the bank; but it is for the good of the country: is that not so?—Yes; but it does not dispose of my contention that a State Bank should be established instead of an Imperial Bank.

6966. But it is for the good of the country; is that not so?—Yes, but that does not dispose of my contention that a State Bank should be established instead of an Imperial Bank.

6967. You are very fond of talking of a State Bank. Do you know what a State Bank is?—Well, something like the Reichbank of Germany.

6968. Do you think this better that the Bank of England which is not a State Bank?—As I said before, the position of the Bank of England is different from the position of the Imperial Bank. In the first place, the history of the two banks is different—The Bank of England was started in a different manner from the Imperial Bank of India. In the second place, all the shareholders of the Bank of England and all the directors are Englishmen. Whereas in India the Directors are all Englishmen and the shareholders are not all Indians.

6969. Then you want them all Indians?—I don't say we want them. That is the position. It does not enjoy, to the full extent, the confidence of the people.

6970. You say the State bank that you propose won't enjoy the confidence of the people unless all the management are Indians.—Oh no. I don't go so far as to say that all the Directors should be Indians, but I say it would command greater confidence if there were more Indians.

6971. Do you think the Federal Banks in America better than the Reichbank or the Bank of England? —Possibly they are.

6972. Can you tell me the number of Bank failures in the United States during the last 25 years compared with the number of failures in England?—In some cases private management is better than State management, I admit.

6973. I am perfectly sure of that. I put it to you that the percentage of Bank failures in the United States during the last 25 years has been 15 to 1 compared to the failures in England.—It is quite possible that privately managed banks are better than State-managed banks.

6974. Then you are not quite so certain that a State bank is better?—No, but in the peculiar condition of India I would prefer a State bank.

6975. Oh yes, you might prefer one, but is it better? —I didn't say it is in every respect better but taking all the circumstances together, I would still favour a State Bank.

6976. (*Mr. Coyajee.*) Dr. Banerjea, would you agree with the view which is advanced by very high authority that the ideal of a pure gold exchange standard is as automatic as the gold standard?—"Pure gold exchange standard" is a term which I do not sufficiently understand. What do you mean by a pure gold exchange standard?

6977. Under the pure gold exchange standard, the following features of our present system would be eliminated. First of all, the fusion between the paper

currency reserve, the gold standard reserve, and the Government balances and their functions. Secondly, the investment into securities of those reserves would be much less. And thirdly, there would be statutory regulation as regards convertibility and as regards the points at which exchange would be sold and bought.—Yes, to my mind there can be a pure gold exchange standard when it is established on an international basis. Otherwise, unless you take the exchange on commodities with as little use of currency as possible, you cannot have a pure gold exchange standard. A pure gold exchange standard can be established only on an international basis.

6978. Have you studied the gold exchange standard system as applied in the Philippines?—I know it has been in existence for a number of years and it has proved a success there. But the Philippines are a very small country and the conditions in such a small country do not apply to the conditions of a large country like India.

6979. A proposal has been put forward before this Commission that it would be a safe thing if the gold standard was adopted very gradually in this way: the interests of the securities under the gold standard reserve and the paper currency reserve should be realised in gold annually and brought to India and this amount could accumulate for 15 or 20 years and thus automatically we should be in possession of a large gold reserve which would help to start the currency. Don't you think such a system would be a much safer one than the one adumbrated by others?—I would not have the system established for such a long period as 15 or 20 years.

6980. Yes, but don't you think the other systems are rather costly?—Yes, more costly than the present system no doubt, and the system advocated by you, but there are other advantages which are likely to accrue from it.

6981. Might we sum up the items of the cost of the other schemes of gold standard. As a first approximation perhaps you would agree that to the country the price of introducing the gold standard is equal to the price paid for the gold turned into currency *minus* the sale price of the rupees made redundant. That is one item. And then should we not add something for the potential depreciation of silver ornaments and hoards?—Yes.

6982. And thirdly is not there another item in the shape of the loss of interest on the securities sold?—Yes.

6983. Then in answer to Sir Purshotamdas, you observed that a substantial proportion of gold hoards would be tendered for coinage. But does not that imply that the rupees would be dedundant in fairly large quantities and would come back to Government seeking for exchange with gold? If a substantial proportion of hoards becomes coin, then a substantial proportion of rupees will become redundant and come back and naturally to be exchanged into gold by the treasury?—That portion which is held in hoards of course would, but not the rupees in circulation because the poorer people could not possibly afford the use of gold coins.

6984. (*Sir Purshotamdas Thakurdas.*) May I, Sir, just correct Mr. Coyajee with regard to the question which he referred to as coming from me. My question was as regards gold held in bullion form in hoards. It does not affect the rupees at all. I just wanted to mention it so that it may be on record. I think I said gold held in bullion form.

6985. (*Mr. Coyajee.*) If gold held in bullion form in hoards is offered for coinage and enters into currency then some of the rupees must become redundant?—Professor Coyajee's point is this, that the total volume of currency would be increased. As the gold portion of the currency would be increased, the silver portion must go out. There would be some little redundancy and some portion will perhaps go out but, as I say, that would not be a very material portion, because the masses of the people don't use gold; they cannot afford to use gold.

6986. True, but in that case much of the gold bullion change into currency must go back to the hoards because if the people won't use a good deal of gold currency then the gold bullion being coined much of it goes back to the hoards. Where else could it go?—Some portion of it would be stored away, perhaps, but some portion would remain in circulation.

6987. (*Mr. Preston.*) Doctor, the Chairman asked you a little while ago which of two rates you considered was the rate better suited to the needs of India, either the 1s. 6d. or the 1s. 4d., and you said that for many reasons the 1s. 6d. was the justified rate and your major reason was that you considered silver was under-valued and therefore that pointed to the fact in your mind that a better ratio was the 1s. 4d. That is correct?—Yes.

6988. As you are aware, India has always had an intense longing for the precious metals and those who have been engaged in the trade of the precious metals have always found one factor, that India has never been a buyer of both the yellow and the white metal at the same time. I think you will recognise that. In other words, that she does not buy gold and silver equally at the same time?—No, not equally at the same time.

6989. Now then, as a matter of preference she will always buy the yellow metal?—Yes.

6990. At the present time and for the last two years, gold has been abnormally cheap, therefore, she has been a very big buyer of gold and for that reason she has been a poor buyer relatively of silver. The result of that is that silver to-day in Bombay round about 70 odd pence, is below the exchange parity?—Is it below the exchange parity?

6991. Oh yes?—I am not quite sure of that.

6992. Well, silver is below the 1s. 6d. parity?—Yes, undoubtedly.

6993. Now, would that not cause you to alter your opinion about silver by reason of the fact that the people of India are buying gold for all they are worth because it is so cheap, would not that cause you to come to the conclusion that the 1s. 6d. parity is not out of joint?—That does not seem to me to be a very important consideration.

6994. But you looked upon the fact that silver was under-valued as being a major consideration to your mind and therefore pointed to the fact that the 1s. 4d. parity was for that particular reason the more suited to India?—What I pointed out to the President was that the comparative prices in India, England and America differed.

6995. That is true, naturally. But the Indian prices are different and the Indian prices would be due to the fact that India was not a keen buyer of the metal and therefore that very factor was reflected in the local price of silver in India?—But there ought not to be this great disparity between the price in England and in India over any length of time.

6996. Well would that not point to the fact that they were not desirous of acquiring the metal? Gold and silver are international commodities and the prices in different countries ought to approximate to each other?—For any considerable length of time there ought not to be any great difference in prices.

6997. America is a producing country. England to a certain extent is a clearing house and to a certain extent a consuming country. Assume the other consuming centres are operating; but one of the largest, India, is not for the simple reason that she does not want the white metal?—That may be a reason, but the fact that the disparity exists for any length of time proves that the conditions in India are different from the conditions in other countries so far as prices are concerned.

6998. Assuming that they stop buying gold and that they commence to buy silver, and silver went up to parity: would you then say that your opinion is changed and that therefore 1s. 6d. is a more normal parity that 1s. 4d., for the reasons which you have given to the Chairman?—That would be one condition which would lead me to think that the causes are not of a temporary character. That is my whole position,—that the present rate is the result of temporary conditions. One of the conditions is that we

have had a succession of good harvests in India,—and there are some people who maintain that the present ratio has been worked up by Government. As I say in my memorandum, in the absence of fuller materials at my disposal, I am not prepared to accept that view. But the fact that the ratio of gold to silver is different in India from that in New York and in London is one evidence at least of the temporary nature of the present conditions.

6999. Let me put this question to you. America and England are on silver parity, India is below. Therefore you say, because India is not on a parity with the other two, I am inclined to believe that really speaking 1s. 4d. is the correct ratio for India, that is your statement?—That does not strike me as a logical conclusion.

7000. Then let me put this question this way to you. England and America are on parity, and India goes up to England's and America's parity. Would you then say that 1s. 6d. was the correct ratio to adopt for this country?—I would then say that the conditions are not entirely temporary but are permanent.

7001. And would you consider 1s. 6d. as the correct ratio?—Yes. That would be one evidence of the fact that the conditions are not temporary.

7002. Might I go to another point. In paragraph 16 you say that the gold standard reserve should in future be employed in maintaining the ratio between the mohur and the rupee, and you say that the reserve should be held mainly in gold, but a small portion of it may be invested in the Treasury Bills of the Government of India?—If the gold standard has been fully established, there would be no need for it.

7003. Then in the meantime you really intend that an improved system should function until such period as you have in view comes along,—and I think in reply to Professor Coyajee you said that you considered 20 years was perhaps too long: what would be your idea?—Four to 6 years. Under very favourable conditions it may be in 4 years, under fairly good conditions it may be in 5 to 6 or 6 to 7 years.

7004. You think all these great changes will be brought about with the minimum of trouble in such short period?—I do not apprehend any very great trouble. Of course there would be disturbances here and there. You cannot move from one standard to another without causing some disturbances, but I do not apprehend any very great trouble.

7005. In any case you say that pending arrival at conditions suitable to bringing your system into operation, an improved gold exchange standard should function?—Well I do not know whether I should call it a gold exchange standard, that is a question of nomenclature, but where the ideal is a gold standard, we must take all steps for the definite object of reaching that ideal.

7006. (*Sir Alexander Murray.*) I just want to make one thing clear. In paragraph 3 you quote from Professor Jevons. Now that quotation there has reference mainly to the rise in exchange, not to the high exchange?—Yes, it is only the rise in exchange, that is made clear.

7007. You say, " the effects of a rising or a falling rupee are well understood. A rising rupee tends to discourage exports and encourage imports." You then go on in the next paragraph to the rise in exchange. At the close of that paragraph you say, " the effect of a *higher* exchange ": You mean the riso in exchange, not the high exchange?—Yes.

7008. Will you accept Professor Jevons' summing up in these words:—" It is to be hoped, however, that anyone who has carefully followed the reasoning of the foregoing pages will be convinced that once the rate of exchange has been raised as just described, and all the economic readjustments have come about, no permanent economic burden would be laid upon India thereby. Stated briefly, there would be fewer rupees in circulation, and each would buy more than it did before." Do you accept that as the summing up of the result of a high exchange?—Subject to this qualification that the transitional period is not necessarily very short and the temporary effects are not altogether negligible.

7009. Then in paragraph 7, where you deal with the permanent effects of a higher exchange, you say that " the rupee becomes an over-valued coin, and the general price level is lower." You do not mean " over-valued," you mean an appreciated coin, a coin with a greater purchasing power?—Yes.

7010. Then you make the statement that " a gold standard does not imply that gold coins must necessarily circulate very largely,"—as a matter of fact you are not in favour of gold coins circulating?—Not to a large extent.

7011. I see you quoted from Dr. Gregory. Now Dr. Gregory in his latest book says regarding the system now in existence in England:—" Under the new arrangements obtaining in this country, (that is, England), we possess a gold standard, but not a gold currency. In other words we have adopted that particular currency system which is known as the gold-exchange standard "?—What is the title of the book, is it " The Return to Gold "?

7012. Yes. You accept Dr. Gregory's definition of a gold exchange standard, and in view of your opinion that the circulation of gold coins in India is not advisable to any great extent, I suppose you will consider that we might be put on the same lines in India as they are in England?—But in England it seems to me from the Report of the Treasury Committee that the intention is to revert to the gold standard in its entirety.

7013. The Treasury Committee reported a long time ago?—Only a year ago.

7014. You mean the Committee appointed by the Treasury last year, in 1924. You gather from that that they purpose going back on to gold in circulation?—That seems to be the intention from reading their report.

7015. (*Chairman.*) The effect of the Report of that Committee was, was it not, to point out the steps recommended for the establishment of an exchange standard and that we might return to a gold circulation some day?—Possibly that is the effect.

7016. (*Sir Alexander Murray.*) In paragraph 13 of your statement, you say that " the relative price levels in India and other principal countries of the world are very nearly the same to-day as they were before the war." Is not that a reason for stabilizing on basis of price levels as far as possible where they are to-day in relation to the other gold-standard countries?—My argument is this. If the relative price levels be the same, why should the rate of exchange be different?

7017. You are working backwards: the point is, as the price levels are the same, is not the fact that they are the same, a good reason for stabilizing at the existing rates of exchange?—But that seems to point to the artificial nature of the ratio, because if in 1914 the price level in England was 100 and the price level in India also 100, and if in 1925 the price level in England is 160 and in India also 160, why should the ratio differ? Why should not the ratio in 1925 be the same as the ratio in 1914?

7018. But the adjustments have taken place, and the ratio is not the same. It has been suggested that Government ought to have stabilized exchange and fixed the ratio at 1s. 4d. in October, 1924, when exchange first touched 1s. 4d. gold. Would you accept that, that it should have been stabilized at that rate when it touched 1s. 4d. gold? In October, 1924, the relative price levels were, in United States of America, 152, in England, 172, in India, 181. Now would you or would you not have asked that we should have stabilized at 1s. 4d. gold in October, 1924, when the price levels in India were 181 as against 152 in the United States?—No.

7019. Then you state that one of the reasons why you think that circumstances are abnormal just now is that we have had three good monsoons running and therefore that is abnormal, but in the very second sentence in your statement you say that " the agricultural situation is quite fair," and you use that

as one of the arguments for stabilizing exchange?—Yes I am in favour of stabilization, the question is as to the rate.

7020. But you make a statement that, agricultural conditions in India are quite fair and the price levels in India and America are like, therefore we should stabilize?—We should stabilize.

7021. We have got all these conditions and that is the reason for stabilizing?—Yes.

7022. At 1s. 6d.?—That is just the point. The exact rate will have to be determined by permanent conditions when we should consider whether the present ratio is the result of permanent normal conditions or merely temporary and abnormal.

7023. But in reply to the Chairman you only pointed out two abnormal conditions at the present moment, one regarding the price of silver with which Mr. Preston has already dealt, and the other regarding the monsoon; but you yourself in the opening paragraph say that even after these monsoons agricultural conditions in India to-day are quite fair?—Quite fair, yes.

7024. (*Sir Rajendranath Mookerjee.*) If the agricultural conditions of the ryot are quite fair, why do you object to a rise in the exchange?—My point is this. If you do not adopt a ratio which is the result of normal and permanent factors you will not be able to maintain it. Suppose there is a bad harvest next year, how will you maintain the ratio?

7025. But take for instance Bengal; the cultivators here grow very little which is exported, except jute, they have not much to export?—Bengal exports jute and Assam exports tea; some tea is exported from Bengal also.

7026. Very well take those two. In jute, as you know being a Bengali, whatever profit is made the middleman takes it and not the agriculturist?—I would not go so far as that but the middleman intercepts a good portion.

7027. In tea it is the company and the company's shareholders who take the profit?—That is true.

7028. And if any commodities or foodstuffs rise in price, that rise reacts on prices of other commodities in Bengal at the same time?—Yes, the principle of substitution comes into force.

7029. I will explain further. Suppose there is a rise in the price of rice, then the price of vegetables will also rise; so have you ever calculated carefully the budget of a cultivator, whether by a rise in exchange he will lose or benefit?—It seems to me that those who have to export their goods, those whose goods are purchased by exporters, will suffer.

7030. But take the average. I know you have said that before. I am only taking the general condition of the people of Bengal?—Shall we consider the question from the standpoint of Bengal merely?

7031. You may answer about Bengal first; I will then come to India as a whole?—Well, growers of jute will certainly suffer by a rising exchange.

7032. But there are large classes who do not grow jute. I am asking you what you have gathered from your experience?—Well there also the principle of substitution comes into force. The value of rice is to some extent dependent on the value of wheat and other crops.

7033. I mean the average for everything. What I want to know is if you have carefully considered the budget of the Bengal cultivator as to whether he will be a loser or gainer by a rise in exchange on the whole?—So far as the Bengal agriculturist is concerned it will be very difficult to answer because if you omit jute cultivators you might asy that those who cultivate rice are gainers from a rising exchange.

7034. Very well, I will leave it there. In paragraph 2 you say "the gold exchange standard is regarded as a brand of subjection and inferiority." What exactly was in your mind? You have answered something to the President but I want a further explanation?—In various books written by eminent men you will find that phrase that the gold exchange standard is suitable only for inferior countries and for subject nations. That is not exactly my phrase but the phrase used by very eminent economists. It is also believed that when you tie yourself to the currency of another country you are in a position of inferiority and subjection; but that is with regard to the gold exchange standard as it existed before. I am not considering a pure gold exchange standard or an international gold exchange standard. Of course I am in favour of the international gold exchange standard if the practical difficulties could be removed.

7035. Now with reference to hoards of the population of India, over 70 per cent. are cultivators, and whatever they save is hoarded in a sense. They keep these hoards for emergencies to buy necessaries or against illness or something like that. Do you think that these silver hoards will come out with a rush to be converted into gold if the gold is issued, having regard to the fact that they will require now 1 rupee, now 8 annas and so on; and that they will not consider it convenient to keep gold but will prefer taking silver for the sake of meeting their necessities?—I entirely agree with you. In my opinion the whole of the hoards will never come up for conversion but a portion may.

7036. So there is no reasonable ground to fear that there will be a rush to convert silver into gold?—Some portion of the hoard will come out but not to a large extent.

7037. Then the Chairman told you that if gold standard and a gold currency were introduced, there is likely to be a protest raised against it. Do you think we can resonably apprehend such a thing?—Well, I personally don't.

7038. (*Sir Maneckji Dadabhoy.*) I understand, Dr. Banerjea, the conclusion you draw in the matter of the fixity of ratio is that our principal, our primary object should be its maintainability?—Its attainability and its maintainability.

7039. And you contend, as I understand you, that the present ratio is not the result of normal and permanent conditions, the present ratio of 1s. 6d.?—It does not seem to be so.

7040. Why do you say it does not seem to be so; because I understand it has not been sufficiently long in existence to give to it the elements or normality of permanency, is that your reason?—Yes.

7041. Your point is that though stabilsation has its value, after all it is a secondary matter because once you get a sound currency system stabilisation will proceed forward, is that your contention?—Because when the rupee becomes legal tender it will not be found necessary for Government to convert it.

7042. I thought there was some confusion in your mind when my friend Sir Alexander Murray referred to Dr. Gregory's dictum. I understand that you only referred to Dr. Gregory's dictum to prove that the value of gold is not likely to fluctuate widely within short periods and the fluctuations in the ratio will be less if a gold standard is adopted?—Yes, over a long time it does fluctuate but within short periods of time the value of gold does not fluctuate.

7043. So the mere fact of the ratio becomes a secondary object. Once you have a gold standard and a gold currency, the ratio will look after itself, and that is the aim we should have for a stable currency?—Mr. Secretary, in this connection I should like you to make a correction in the printed memorandum in paragraph 9. "From the standpoint of stability of commodity prices the gold standard is not an *impossible* standard." It should be an *invariable* standard, not an impossible standard.

7044. My next question is if we come to the conclusion that we should have a lower ratio the factor of adjustment is not one of insuperable difficulty?—Yes.

7045. The adjustment will take its natural course in time?—Yes.

7046. Now let me draw your attention to paragraph 10 where speaking of the gold standard you say that gold as currency is uneconomical, and then in answer to the Chairman you said that you would not like to force gold coins into circulation. Am I to understand that you advocate a gold standard without a gold currency?—No, I do not advocate

that; but I do not like the system which was adopted by Government in 1899 or 1900 when payments were made in gold coins from the Post Office and the Treasury.

7047. But if you introduce the gold standard into a country like India without a gold currency, without a visible gold currency, is it not likely to be distrusted, your whole system?—No, I should like to have a natural system. If the people want gold let them have it, but we won't force it on them. The whole point is in the words "force it into circulation."

7048. Then you would not force it?—If you show your eagerness to part with gold coins people will hesitate to accept it. That is a psychological fact. We part with things which we do not want to keep ourselves.

7049. But you see, Dr. Banerjea, there is a good deal of bullion reserved in the hoards just like silver rupees. When the gold standard is introduced with the establishment of a mint in the country bullion will be brought out for the purpose of coinage into gold coins, whether it be sovereigns if we adopt the sovereign as a gold coin or gold mohurs or any other coin of a smaller or bigger denomination. Those gold coins once they are brought for coinage must circulate to a certain extent?—Yes, I would not impede the natural course of circulation.

7050. In this connection I would draw your attention to paragraph 51 of the report of the Fowler Committee, in which they say this: "We are of opinion that the habit of hoarding does not present such practical difficulties as to justify a permanent refusal to allow India to possess the normal accompaniment of a gold standard, namely, a gold currency." Do you agree with this?—I entirely agree with that view, only I would not force gold into circulation. I think the steps which were taken in 1900 were inadvisable.

7051. Only one more question on this aspect: both Sir Purshotamdas Thakurdas and Sir Norcot Warren have exhaustively examined you in connection with your remarks about the Imperial Bank, but I want to know one thing: when you speak about the management of the Imperial Bank, I presume you do not speak from any personal knowledge?—No.

7052. And all the remarks you have made to-day have been based on certain assumptions?—Yes.

7053. You do not know the exact working of the Imperial Bank?—No. I have no personal knowledge, and my remarks come from the knowledge that any outsider can possess.

7054. You cannot at the same time state that the Imperial Bank could not be brought to that state of perfection which is your ideal and in which it would be safe to leave the management of the note issue to it?—I would not aver that.

7055. (*Sir Reginald Mant.*) Dr. Banerjea, you recommend a reversion to the 1s. 4d. ratio on the ground that it will be difficult to maintain the 1s. 6d. ratio?—Yes.

7056. Do you hold as a general proposition the view that has been put before us by some witnesses that it is easier to maintain exchange at a lower rate than at a higher rate?—My view is that it is easy to maintain exchange at the normal rate; and the normal rate is one which is the result of more or less permanent conditions. If you fix the ratio at 1s. 6d. Government will find great difficulty in future in maintaining it. If there be a bad harvest a great deal of difficulty will be felt.

7057. If we were to assume that prices and the volume of currency had been adjusted to a particular rate, be it 1s. 4d. or 1s. 6d., do you hold the view that it would be easier to maintain it at 1s. 4d. than at 1s. 6d.?—Of course, it would be easier.

7058. Apart from the question as to which is the normal rate, I am not going into that?—It will be easier.

7059. Can you explain why? That is what I have not been able to understand. Let us put it into figures. Let us assume that the volume of currency, rupees and notes required with the rupee at 1s. 6d. is 400 crores. Now to adjust the volume of currency to the 1s. 4d. rate you would require a circulation of 450 crores, would you not?—Yes.

7060. Now, supposing there was a bad monsoon and you have to contract your currency by, say, even 10 per cent. at the 1s. 4d. rate, you would have to withdraw 45 crores of rupees from circulation and convert them into gold or international currency. With the 1s. 6d. rate you would have to withdraw 10 per cent. or 40 crores to be converted into gold or international currency. In the latter case the 40 crores would purchase just as much gold or international currency as the 45 crores in the other case. So can you explain why it is easier to contract in the one case than in the other?—I have not exactly followed your question; the question is to maintain the convertibility of the rupee; that is the question; as the silver content of the rupee is only 11 annas or something like it——

7061. Let us make one more assumption, and that is, that in either case we have adequate sterling reserves so that it would not be necessary to melt down rupees and sell them for silver. We do not want to bring in that complication?—My point is this: I do not say that it is easier to maintain the exchange at a lower level than at a higher level.

7062. If you do not say that?—I never said that. I said that the figure should be such as is normal, that is, the result of permanent conditions.

7063. You do not hold that it is easier to maintain exchange at a lower than at a higher level?—Not under all conditions; but in India under present conditions——

7064. Let me finish my question: leaving aside the questions as to which is the normal rate?—I would not discuss it at all; I do not hold that it is easier to maintain exchange at a lower level than at a higher level.

7065. (*Chairman.*) I think Sir Reginald Mant's questions are based on the passage in your memorandum which says, "the Government will find considerable difficulty in maintaining the 1s. 6d. rate. It seems desirable, therefore, to revert to the old ratio, namely, 1s. 4d. to the rupee"?—Yes; but the whole of it is based on the view that the present situation is not permanent. If you will kindly read paragraph 12, you will find I say there: "This brings us to the question whether the existing ratio is a natural or an artificial one. The view seems to prevail in certain quarters that the present rate has been worked up to by the Government. In the absence of fuller information than I possess just now I am unable to say whether this view is correct or not. But I am convinced that the conditions which are responsible for the existing rate are not of a permanent character, and I fully endorse the view of Sir James Wilson."

7066. (*Sir Reginald Mant.*) I understand your position perfectly there. I only want to clear up whether you adhere to the view that has been put before us by other witnesses that it is easier, as a general proposition, to maintain exchange at a lower rate than at a higher rate. I understand you do not?—Not as a general proposition, but under certain conditions.

7067. (*Chairman.*) We are very much obliged to you for your very full assistance this morning.

(*The witness withdrew.*)

Mr. B. VENKATAPATIRAJU, C.I.E., M.L.A., called and examined.

7068. (*Chairman.*) Mr. Venkatapatiraju, you are a Companion of the Order of the Indian Empire?—Yes.

7069. And a Member of the Legislative Assembly?—Yes.

7070. You have been kind enough to come to help us to-day on the matters referred to us, and you have been good enough to furnish us with a memorandum* which sets forth your views upon the subject of our reference. I see on the first page that you were responsible for the motion in the Legislative Assembly which may have had some connection with the genesis of this Commission?—By ballot I had the luck and so I moved the resolution.

7071. I will, if I may, put a few questions to you. Your memorandum is so full that it will relieve me from the necessity of troubling you at any great length. In the first place, what are your reasons for preferring the gold standard which you set out, with gold in circulation, to a scientific gold exchange standard?—My first objection, Sir, to the gold exchange standard is that it has neither logical nor ethical nor economic basis. I say not logical for the reason that the obligation created is not mutual or reciprocal.

7072. The obligation between whom?—Between the State and the people. I say it is not ethical because, during the pendency of the contract, one party has no right to increase the measure or unit of value.

7073. What is the contract to which you are referring?—The State entering into various obligations; for instance, when entering into the permanent settlement with Zamindars it was agreed that they should receive a certain fixed amount for ever in rupees. Now, when you increase the value of the rupee, you are taking a larger amount than you are entitled to.

7074. If I may interrupt just for one moment, are you proceeding upon the basis of the relations between the State and the taxpayer being regulated by contract?—No. I am not speaking about the general taxpayer with reference to the relationship between the State and the people. With reference to the permanent zamindari holders and the ryotwari holders, relationship does not stand on the ordinary footing; because within 30 years the ryot is not bound to pay more than a fixed amount. That contract is fixed for a period of 30 years, and you are entitled to take, say, Rs. 10 per acre. If instead of taking 10 you take Rs. 12 it is not reasonable.

7075. You use the word " contract." I just wanted to ascertain whether you are proceeding on the basis of the payment by way of land revenue payment as a payment based upon a contractual relation between the State and the taxpayer?—Yes.

7076. In public law, is it a common view nowadays of publicists that the relation between the State and the taxpayer is a contractual relation?—During the time of Sir Charles Wood it was settled that land revenue ought to be treated as revenue but not as rent. In India, whatever be the view in England, it ought to be treated as revenue, as otherwise the Government can realise economic rent, whereas it is only realising equitable rent.

7077. I quite follow you, that you say that the land revenue should be looked upon as rent based upon a contract as between landlord and tenant?—Yes.

7078. You were proceeding from that to tell us the reasons for preferring the gold standard, with gold in circulation, to a perfected gold exchange standard?—Unless you have a clear and definite standard, as a standard coin by which both the subjects and the State are mutually obliged to exchange and pay their taxes, if the Government for national purposes, or even for laudable purposes, wants excess revenue, they ought not to impose this invisible taxation by increasing the value of the rupee silver note.

7079. Invisible taxation of this sort depends on the ratio between the internal currency and gold?—Yes; that means practically imposing duty on exports and giving bounty to imports.

7080. Are you then in favour of maintaining the present ratio of 18d.?—I am in favour of 16d., because we must be as near as possible, under the circumstances, to the bullion value.

7081. One could not attain 16d. without a measure of inflation?—Yes; because from 1s. 4d. we have increased to 1s. 6d., and in course of time we can increase to 1s. 8d.; there is not much difficulty.

7082. And inflation is recognisably one of those invisible taxes which you deprecate?—Yes.

7083. Might it not, therefore, be said that by returning to 1s. 4d., with a necessary measure of increase of the currency, we should be doing just what you deprecate, that is, imposing an invisible tax on the people?—Yes; but under the circumstances, rightly or wrongly, for the last 20 or 25 years you made them pay. They are accustomed to pay it, and, therefore, whatever grievance there is, there it is, and we would not increase it. Not because it is equitable, but it cannot be helped, because for the last 20 years we are doing it.

7084. Do I understand that you would be opposed to the adoption in India of a system like that in the United Kingdom, where gold is available for external purposes only, and does not circulate in the country?—But in the United Kingdom now I don't think there is any difficulty for them so long as the sterling and bullion are on par. They have no silver coinage like shillings which have got any independent existence, apart from there being a subsidiary coin. All attempts made in order to bring in the scientific measures have been rejected even by the financial experts in England as well as by various other persons.

7085. You are aware, are you not, that at the present time we have in the United Kingdom a gold exchange standard?—I am not aware. But I am aware that they have got gold standard.

7086. In the United Kingdom, internal currency is not convertible at present. Gold is only obtainable for export. I understand that you would not be content with such a system for India?—I want not only gold standard but also gold currency.

7087. What additional advantage, in your opinion, is added by having gold in actual circulation?—If there be standard gold coin in actual circulation and the people instead of depending upon the executive, can import gold by selling articles in foreign countries and they can pay taxes instead of depending upon Government, it is an advantage.

7088. Let us examine that, because this is a basic point. People can now get gold, can they not?—They can get gold but we cannot offer gold because we have to offer only at any high figure. We cannot give sovereign for Rs. 10 when the value is more. That means a practical loss when you give a sovereign to get Rs. 10.

7089. That is due to the artificial ratio?—Yes.

7090. Supposing that the established ratio were reduced to the current rate of 18d. and a mint were established in the country, so that anybody who liked might have gold bullion coined into gold for currency purposes, what would the effect of that be in your view?—At this 2d. in excess over 1s. 4d. there will be an additional increase of export duty of 12½ per cent. and a bounty on imports, equal to that amount.

7091. If gold were given in exchange for rupees, would, in your opinion, a large proportion find its way straight into hoards, and, if so, what would be the advantage of that, or would it remain in circulation as currency?—The necessary amount for the use of subsidiary coin must be maintained because at all times some amount of rupees must be in circulation. But when you want to keep a depreciated rupee and when they can possibly get a high-value sovereign, they would naturally prefer to convert it if they can have it.

7092. Would, in your opinion, the gold now held as a store of value in the shape of ornaments or

* Appendix No. 34.

bullion——?—Oh yes. That is not only now but for 50 centuries in India.

7093. I am not quite sure you have appreciated the effect of my question; I did not, indeed, finish it. Would the gold now held as a store of value in the shape of ornaments or bullion be presented for coining, and, if so (just to present the alternatives), would it go into circulation or be replaced in hoards?—I think when bullion can be converted easily by the mints in giving current coin, a large amount would naturally flow again into the mints as it has done in other countries. There is no difficulty so far as that is concerned because there is no particular facility here. There is no particular advantage now, so people keep it either as bullion or as ornaments. Otherwise as necessity arises, the ornaments would be melted or the bullion would be sent to the mints as soon as they can have a definite value.

7094. Now we come to the real difficulty which your proposal presents at first sight, and that is this. You contemplate in your very full memorandum the conversion into gold of as much as 300 crores of rupees. From whence shall we obtain the gold?—I think it will take some time. According to the calculations mentioned in the Secretary's memo. I think the amount that will necessarily be offered will be only about 110 crores, they say. But whatever be the amount we must get sufficient gold for such of the excess coinage which is not intended or which is not necessary for subsidiary purposes.

7095. How will you get it?—We have got some gold already and we have got sterling securities and gold in reserve altogether to the extent of 116 crores and after all you want only 110 crores—that is not much. In the course of five years you can find necessary amount.

7096. What is the figure at which you finally arrive? —116 crores both in gold and in sterling securities.

7097. You see I am confronted at the beginning of paragraph 50 of your memorandum with the statement: " About 300 crores should be gradually converted into gold coin." That is your considered estimate, I imagine, of the amount to be converted?—Yes, but I found from the other information supplied by the Secretaries that 110 crores only would be necessary, not 300 crores. That is what I guessed. I may be wrong. But after all it is all guess work. We must account for the coin 350 crores. Whether any has been melted or sent out or available—it is all guess work.

7098. It is all guess work?—Yes.

7099. In connection with this question of the opposite side of the book and the sale of silver, I understand that you recommend an import duty on silver of 15 per cent.?—Yes.

7100. From your practical acquaintance with administrative conditions here, with public opinion and so on, do you think it would be possible, supposing such a measure were to be adopted, an import duty on silver, to keep up the higher price of silver in India when there was a much lower price in the rest of the world? It is a practical question that deserves consideration, is it not?—But my submission is that when silver is brought into India then they have to pay an import duty. But so long as it is outside India, the price prevailing outside will be the price prevailing in Inda *plus* duty. But when you want to compete with India you have to pay an import duty.

7101. There is a strong bonus upon illegal import under those conditions, is there not? I am told that, in the past, there was great difficulty in maintaining the customs barrier against the importation of this high-priced commodity in a small volume under these conditions?—But we didn't find any difficulty in putting an import duty on silver, jewellery, etc. I don't think there will be much difficulty. And this has been advocated by the Karachi Chamber for a long time and by some members of the Assembly.

7102. You do not admit there there will be any administrative difficulties?—I don't think so.

7103. Even from your acquaintance with a similar duty in the past?—I don't think so, Sir. Of course, some portion would escape and would be detected.

7104. In connection with this interesting question of a ratio for the rupee, I think I can put my essential question to you there in a very general way, and that is whether, in your opinion, the prices of commodities are adjusted to the ratio of 18d. which at present prevails as the market rate of the rupee?—As I understand it, Sir, the world prices are higher than the prices in India and that is on account of the high exchange. On account of the high exchange our prices did not soar sufficiently high along and in sympathy with world prices.

7105. Present prices?—Even the present prices, with reference to various articles. I don't think they have got the same price which they are fetching in other countries.

7106. What articles are you referring to in that connection?—I may mention the articles that are generally used (which are not the monopoly of India for instance like jute and such like),—we can take either rice or wheat.

7107. Does the price of wheat in India show any marked maladjustment with the world price of wheat? —I have not got the prices of to-day but for a long time the prices here were less than those prevalent in other countries. The prices prevalent in other countries are much higher than the prices prevalent in India, but I don't know the exact prices to-day.

7108. Is it your impression that the prices prevalent in other countries at the present time are much higher than in India?—That is my impression.

7109. What do you consider would be the consequence of an enhancement of prices if the ratio were to be reduced to 1s. 4d.?—It would be to the advantage of the producer, to the larger number of the people, and all those who depend upon land.

7110. How would that advantage accrue?—Because most of the articles which they consume they produce from the land and what little they want from outside they can utilise it from the sale amount.

7111. What would be the effect upon the country?—It will be altogether beneficial. This is not only my own personal view but this is also the view of Mr. Datta, who inquired into the prices, and various other persons.

7112. Who is Mr. Datta?—Mr. Datta was the Accountant General to the Government of India and was specially appointed to inquire into prices. In his report he stated ——

7113. What report are you referring to?—An Inquiry into the Rise of Prices in India, by K. L. Datta, M.A., Fellow of the Royal Statistical Society. In this report he states that it was beneficial on the whole, taking all things into consideration.

7114. Such a general statement can be of no assistance to the Commission?—He has devoted 30 or 40 pages to this subject.

7115. You would refer us to his arguments in that particular passage relating to the rise of prices, which the Commission will consider. What is it exactly? Can you summarise for us what Mr. Datta sets out in his report?—He says on the whole it is beneficial.

7116. Beneficial to whom?—Beneficial to the people.

7117. What is beneficial?—That is lower exchange and higher prices will be beneficial to the country in general. On page 189 he says: " In the last chapter it has been shown that the effect of the rise of prices on India as a whole has been beneficial."

7118. What rise of prices is he referring to there? —He is referring to the prices of various commodities up to the year 1914, before the war. This book was published in 1915.

7119. It would not necessarily follow from that that a further rise of prices at the present time would be beneficial?—Because whatever be the rise of price for the produce that is exported from this country it is an advantage.

7120. You see we have always to consider the limiting case. How far would you carry it? If a rise in prices is beneficial, where would you draw the line?—It all depends upon the extent of the demand. If the people are not prepared to pay the price, they will not buy it, they will go in for some other substituted article.

7121. On page 189 Mr. Datta, who is a Fellow of the Statistical Society, a Master of Arts, and an official of the Government (he was an Accountant General), says: "the effect of a rise of prices in India on the whole has been beneficial. India has now to part with much less of her produce to meet her foreign obligations for the same reason that her produce has risen in value in European markets"?—With your permission, Sir, I may quote, you may attach what value you may be pleased to, from a book, "Ideals and Realities, Studies in Education and Economics," by Mr. Shaffat Ahmad Khan, M.A., Litt.D., Assistant Professor of Indian Economics, Madras, and who was Senior History Lecturer to the London County Council in 1917-19, etc. He concludes in his book thus:—"We may now review the above, and sum up the results of our inquiry. High exchange will certainly mitigate the rise in prices, and though certain producers will suffer, the public will be the gainers. But this advantage is countered by the losses which the Indian export trade and the Indian industrial establishments will sustain through the rise in the exchange value of the rupee and competition from foreign countries. It will curtail exports and give a great impetus to imports. The curtailment of exports may only be temporary, but the adjustment to which some defenders of high exchange referred may be delayed so long that the Indian exporters may find themselves ousted from foreign markets. On the whole, I think, a high rate of exchange will prove disadvantageous to India. Her export trade will decline; cheap Japanese goods will dominate the market and tough prices may fall and the cost of machinery, etc., may be lowered, the industrial development of India which began only recently, and which ought to be fostered actively, will be retarded by the raising of the exchange value of the rupee."

7122. That is much to the same effect is it not?—Yes.

7123. Then you base yourself upon the view that a fall in the Indian exchange and a rise in internal prices in India can produce a rise in the value of Indian products in the European markets?—My submission is this. Supposing for 10 sovereigns I get say Rs. 150. The Indian producer in such a case thinks he has got Rs. 150; if he could get only Rs. 13 per sovereign, he says he is getting Rs. 130. Therefore the difference between Rs. 130 and Rs. 150 is the difference which he thinks he was able to sell by a lower exchange. If a person were to get 10 sovereigns. If you fix it at Rs. 13, he would get only Rs. 130 in exchange in India; if he gets 15, he can get Rs. 150, so in such a case he thinks he made a profit of Rs. 20 in excess.

7124. I want to be sure that I am doing justice to Mr. Datta's argument. He refers to the rise in value of Indian produce in European markets, and, I gather, otherwise the argument would be totally irrelevant, that he attributes that to the effect of the fall in the Indian exchange, so that I think on the whole I have done justice to Mr. Datta's arguments. Now will you tell me, from your wide practical experience of the conditions of contracts and so on in this country, what your view is on this point. We have been passing through a period of very variable exchange, and at each variation of exchange a certain number of contracts have been entered into based upon the prevailing rate. There was a long period of 1s. 4d., then a period of extremely fluctuating exchange rates, followed by the recent comparatively stable rate. What, in your opinion, from your large experience of trade conditions, is the magnitude of the relative interests involved in the 1s. 4d. contracts, the contracts between 1s. 4d. and 1s. 6d., and the final contracts recently made at 1s. 6d.?—There is of course no census or any account prepared by the Government of the actual indebtedness of the people, but generally so far as I know, there was a large amount of agricultural indebtedness, and those agriculturists could only realize, if they got higher prices in order to discharge their debts, if they got a smaller number of rupees, they might not be able to discharge their debts; therefore, in that manner they would be affected, and that was a very large amount, it might amount to 900 crores according to my idea but it cannot be less than 600 crores.

7125. How have you arrived at that interesting figure?—We have got the previously published books about the agricultural indebtedness in the Punjab by Messrs. Darling and Calvert Shornburn as well as in Madras by Nicholson with reference to various provinces. If you calculate it, we arrive at a figure which ranges between 600 to 900 crores.

7126. That is one element with reference to the advantage and disadvantage to agriculturists, but that is, after all, only one figure which does not enable us to make a comparison. Are there any other figures to compare with that as to the volume of contracts in India?—With reference to the Government obligations of course, when they have to pay rupee obligations which are about 500 crores, if the value given to it would be disadvantageous by increasing the price of the rupee, in that respect the Government are undertaking a larger duty by increasing by a higher exchange the obligations which they owe to the public. That is a disadvantage to the taxpayer. I am putting the converse case, in case they have to convert it into sovereigns at any stage, the taxpayers will unnecessarily be burdened by this high exchange.

7127. I understand the general effect of your recommendations is that you would introduce a gold standard with a gold currency; that you would limit the legal tender of the rupee; that you would make rupees convertible into gold; and that you would adopt the ratio of 1s. 4d. as between the rupee and the new gold standard coin?—Yes.

7128. Would you like to supplement that in any particular as regards the future control? Is there any point regarding the control of the currency of the country on which you would like to lay special emphasis?—My submission is that unless our currency is placed on a sound and durable basis, this is not an opportune time for transferring it to the Imperial Bank, because the Imperial Bank of India Act has to be revised by 1931. Within these five years we may be able to gauge the correct situation with reference to the convertibility of the rupee obligations into gold, and the Bank itself cannot undertake that responsibility or take that risk; and moreover whatever profit they realize would go to them and not to the State, that means, indirectly, to the taxpayer because—

7129. All this is a matter for agreement, is it not, between the Bank and the State?—Well in 1931 we can scrap all the terms and introduce fresh terms. That is the time when we can fix our own terms. Now in the pending currency of the old agreement, we cannot introduce terms which will be disadvantageous to the Imperial Bank.

7130. I do not think we need be unduly intimidated from an inquiry by the fact that there is an outstanding agreement between the Bank and the State. I am completely ignorant as to what notice is necessary for its termination. We ought, in making any recommendations, to consider the question at large, to consider what is best?—Of course if the proprietors and shareholders are prepared to place it on a general basis without relying upon the terms of the Act, then they can enter into a fresh agreement. If they say "we will hold on to what we have got," ——

7131. I imagine you would maintain that, subject to the observance of absolute equity to the shareholders of the Imperial Bank, reasons of State are far too strong to prevent any existing order standing between Indian merchants and that organization of a central banking system which is best in the interest of the State?—I always liked a Central Bank because some years ago I said that even currency should be entrusted to the Imperial Bank, but what I find is that all the profits will go only to the shareholders, and there is no share at all for the State to any extent whatsoever as it is in some other countries, and I think it must be considered how far we can allow the Imperial Bank shareholders to be benefited

at the expense of the taxpayers, and whether the taxpayer or the State should not realize a portion of it. For instance, in Germany, if they get more than $4\frac{1}{2}$ per cent. dividend, the German State would get half; when it rises to 8, they get about $\frac{3}{4}$ths and here, even when it has gone up to nearly 24 as nett profits whereas under the system of the old Presidency Banks it used to be only between 10 and 14, there is not a gain of a single pie to the taxpayer. Therefore, all these things must be considered; but we are now in a difficult situation, how to place currency on a sound, durable basis, and perhaps the situation will be complicated by bringing in another factor which does not sound after all very easy solvable matter.

7132. That other factor being the transfer of the control of the currency issued?—Yes. There are 191 crores, on 50 per cent. of which they can realise interest without sharing it with the taxpayer.

7133. What are those figures?—At present there are 191 crores of currency, that is in currency notes, in circulation. What they suggest is that out of 191 crores.

7134. Who suggests? — Perhaps some witnesses before your Commission.

7135. Are you referring to the memorandum of suggestions?—Yes. Therein they state that they are entitled to 50 per cent. issue without any reserve. That means an advantage of realising interest on that amount.

7136. 50 per cent. fiduciary note issue?—Yes.

7137. And your comment upon that?—Interest on about 95 crores will accrue to the Bank and not a pie would be shared by the taxpayer.

7138. You would not suggest, would you, the bank was doing nothing in return?—In the circumstances the only thing that was mentioned is that they will purchase bullion as is done by the Bank of England.

7139. There is nothing startling or unprecedented in such an arrangement. Is it not a common arrangement, as between a Central Bank of issue and the State, that, in return for the profits to be made upon a fidiciary note issue, the Central Bank in the first place performs certain services for the Government, such as the control of the national debt, and indeed, the management of the note issue itself, and further, that under certain circumstances there is an actual payment made by the Central Bank to the Government in some form of tax in return for the privilege of note issue. We do not find anything unusual in such an arrangement?—But in the arrangement suggested by you, Sir, I do not find a special advantage except that they will maintain an exchange according to the rate fixed by the Government. But they do not take any risk because instead of themselves undertaking to keep the reserve, the Government itself should keep the reserve for redemption.

7140. This is a matter upon which I have the advantage of being able to put to you some questions which have already been put to-day to another witness. There are various services performed by the Bank. There is the opening of new branches at a loss. That is a service rendered to the State?—That is in consideration of keeping the treasury balances.

7141. Let us look at the two sides of the account. On the one side, there is the keeping of the treasury balances and the privilege of note issue; on the other side of the account—(I am not sure that I am enumerating the whole number),—there is the actual management of the note issue and the opening of new branches?—Opening of new branches, they have undertaken it when they agreed to keep our treasury balances with them.

7142. May I suggest to you the other things that occur to me? We have also been told in evidence that there is the conduct of the remittance business at a rate lower than it can otherwise be conducted at, that is, remittances as between cities A and B in India for the public. Further, I suppose it will be part of this proposal that the Bank should conduct the remittance business for the Home charges for the Government. I am just trying to enumerate all the services which a bank would render. I have no doubt there are others which escape my memory at the present moment?—I am not averse to Bank managing all these things. But they should not receive abnormal profits. Previously the Presidency banks were making a profit of 10 per cent.; they are now making 24 per cent. We must make some arrangements to see that the interests of the taxpayer are not sacrificed.

7143. That is all I wanted to bring out, that it would be a matter for agreement between the Central Bank and the State to provide a fair adjustment of mutual benefits and advantages?—But I may add, especially at a time when there is no responsible Government, all the more the burden is on your Commission to see that the interests of the taxpayer are properly safeguarded in making the suggestion of entrusting about 190 crores of note issued to the bank when they have got a capital of about 11 crores.

7144. (*Sir Reginald Mant.*) Mr. Venkatapatiraju, you quote a conclusion from Mr. Datta's report that the effect of a rise of prices in India as a whole has been beneficial. Did I understand you to say in reply to the Chairman that Mr. Datta was there referring only to the rise in Indian prices, internal prices, or to the rise in world prices?—I was mentioning my view and I am supported by Mr. Datta and various other persons who have dealt with this subject. I am mentioning my view. My view is that the ryot will receive advantage by getting more rupees so long as you continue rupees, whatever be the value realised in the foreign market.

7145. I was not asking your view. I was asking the interpretation which you placed on Mr. Datta's report. I leave it to you to interpret it?—That is my view and I am supported by Datta.

7146. (*Chairman.*) I am afraid I had no time to look at the report very carefully.

7147. (*Sir Reginald Mant.*) I have had time only to glance at it but it will only be fair to Mr. Datta to pursue this statement. Did you or did you not imply in reply to the Chairman that Mr. Datta in this passage was referring only to internal prices or to the rise in world prices?—I am not sure whether I made myself intelligible. But my contention is——

7148. I want to know how you interpret Mr. Datta's authority to which you referred?—It is there. I am not interpreting it. I leave it to you to interpret. I am stating my view and also state that this is supported by Datta.

7149. In paragraph 328, Mr. Datta states: 'It is far from being a matter of grave doubt whether the welfare of the country as a whole is furthered by a rapid rise in general prices. The question depends on the general economic condition of the country itself. A debtor country which has a large foreign obligation to meet or to export part of its produce benefits when the price of such produce rises.' In para. 333 he says 'India is a debtor country with large foreign obligations.' He then analyses the rise in prices of India's exports and he says, 'the rise of prices in recent years has enabled India to discharge her foreign liabilities by the export of a proportionately smaller quantity of her produce.' I put it to you, Mr. Venkatapatiraju, that he is referring there to the external prices, the prices that India gets for sale of her produce. He is not referring to a rise in prices produced by a lower rate of exchange and in the passage you quoted he was summarising his previous argument?—Suppose I can sell 10 garsis at Rs. 15 a sovereign, garse being a measure of grain. In order to get a certain amount I will sell a certain quantity. The ryot has to make payment in rupees and for that amount he can sell it. It may mean as you suggested that it may be the world price in a foreign country or it may mean larger money realised by the ryot; but it does not mean only world prices. It cannot be definitely said, as you seem to suggest, that it means only world prices.

7150. It obviously means world prices?—It may not necessarily mean that. It means both world prices and internal prices. I do not dispute your proposition but I do not give up mine.

7151. Now leaving aside Mr. Datta, can you explain to me how India as an exporting country will benefit from a rise in internal prices only without a corresponding rise in external prices?—Unless the ryot realises whatever he expects, he won't sell it either internally or externally. He expects a certain amount, to meet his cost of production and other things. He won't sell his produce either internally or externally unless he would get that amount and if a foreign contractor wants to purchase it, he must purchase it at his price and if there would be a sufficient demand, he would realise it.

7152. By foreign contractor, you mean foreign purchaser?—Yes. The foreign purchaser must pay the prices which the producer dictates if there be an effective demand. If there is no effective demand, if there is a copious supply, he might expect what price is offered to him. Otherwise, he will dictate his own price.

7153. If you have a monopoly. But if you have not a monopoly and you fix a higher price and people are not prepared to pay it, you won't sell your article?—Yes; I admit that with reference to the article which is not a monopoly. But I say effective demand and copious supply determines the price.

7154. (*Sir Purshotamdas Thakurdas.*) Whatever be the exchange ratio in India, do you think that that make any difference in the world prices of a commodity? Whether the exchange in India is 1s. 4d. or 1s. 8d. or 2s. 4d. or 1s. 1d., do you think that that makes any difference in the world prices of a commodity?—Not at all.

7155. The world price is the same, is it not?—Yes.

7156. Then the only extent to which the Indian cultivator is affected by the ratio here is as far as the conversion of the world price into rupees is concerned?—Yes, into the coin which he is to receive.

7157. Namely, the Indian rupee?—Yes.

7158. Then the question of any higher price in gold, in the world market does not at all rise?—Not at all.

7159. Your contention therefore is that the lower the ratio the more rupees the Indian cultivator will get for his export?—Yes.

7160. And the higher the ratio, the less rupees he will get?—Certainly.

7161. You do not expect that there will be any change in the price available for a commodity by the Indian cultivator owing to any change in the ratio?—No, not at all.

7162. Will you refer to paragraph 48 of your printed memorandum. The last part of it shows, if I interpret your quotation there correctly, that you have no faith in the theory of control of prices by exchange manipulation or by change in the ratio. Would that be a fair interpretation of that paragraph of yours. I beg your pardon. I mean the first part of that paragraph where you say with regard to a scientific currency "As Mr. Morris puts it, it is unstable in itself and non-international in practice, if paper money is to be regulated by index number of prices which we are told 'are never accurate in their decimals and rarely in their units'". You have no faith at all in the scheme of control of prices by exchange manipulation or a change in the ratio?—If I may make my position clear, stability of prices cannot be secured, that is my idea, by any of this artificial control. You can stabilise prices by imposing a law that you ought not to sell except at such and such a price, as in fact has been done in famine days and during the war.

7163. You mean control of prices of foodstuffs?—Yes you can fix prices direct by statute and legislation saying that people must not sell their grain at more than this price and so on. Or you can put an embargo upon export so that they will necessarily be cheaper in the country.

7164. Then I understand I am quite correct if I interpret this part of your statement to mean that you do not believe in any control of prices by a change in the ratio or by any rise or fall in the exchange?—Yes I agree.

7165. You were telling us something about land revenue every 30 years. I am afraid I did not follow you?—In the Madras Presidency and also in some other Provinces once in 30 years settlement is made with the ryots by the Government that they must pay a certain number of rupees say Rs. 10 per acre wet and Rs. 6 per acre dry.

7166. What crops?—Wet land and dry land; the assessment is fixed for a period of 30 years and cannot be changed. If during that period you artificially raise the value of the rupee that ryot who sells his produce and receives a smaller number of rupees would necessarily be the loser by the manipulation of the exchange. That is one case. Another is with reference to most zamindaris under the permanent settlement which have a fixed assessment payable to Government at a certain rate which is permanent and the Government cannot increase or decrease it; they may forego it but not decrease it. If they are producers to the extent they are producers, if they receive grain towards their dues they will be affected otherwise they will not be affected. Persons who receive rent in cash will not be affected. Persons who are producers will to that extent be affected because their produce will realise a smaller number of rupees.

7167. The actual grower, the tiller of the soil?—Yes.

7168. I will just ask you one more question. In paragraph 49 you say, "The only feasible course seems to be of using currency notes of a pound and 2½ and 5 and 10 and 100 and 1,000 pounds by converting rupee notes at Rs. 15 per pound." You want pound sterling?—No I mean the sovereign; I do not mean sterling, but I find no difference at the present moment between sterling and pound in England.

7169. You mean notes of a sovereign, and then 2½ sovereigns and 5 sovereigns?—Yes, different denominations.

7170. All in sovereigns?—All in sovereigns or if sovereigns are not accepted by the Home Treasury authorities in mohurs.

7171. The pound there means the gold coin whatever it is to be?—Yes, the gold coin.

7172. (*Professor Coyajee.*) Excuse me, Mr. Raju, but let us distinguish the problem considered by Messrs. Datta and Shirras from the problem before this Commission. In the first place in those days the exchange remained steady. "While the exchange remained steady the prices of Indian produce rose whereas the prices of imported goods fell; therefore India had then to part with much less of her produce than formerly to meet her foreign obligations; the surplus of produce available for export was very much more valued on account of the rise of prices than formerly and consequently India's exports have have grown considerably in value in consequence of the rise in prices and only a part of this increase goes towards meeting the increased cost of production." That is not the case at present. At present the exchange has been reacting on the prices. Formerly it remained steady although the prices of your exports were affected in a few cases. You see India gained in those days as a country on acount of the rise in prices. This is accounted for by Datta and Shirras by saying that India obtained for each unit of produce exported a larger price whereas she paid a smaller price for each unit of import. That distinguishes the problem from now when prices have risen both in this country and in other countries both in the case of exports and imports. Then coming to the cultivator

he gained by a rise of prices but for a special reason. The cultivator gains because his prices have risen faster than his cost of production. As Messrs. Datta and Shirras say, it is not always that the cultivator gains by a rise in prices but only if the prices of his produce rise whereas his cost of production does not rise correspondingly?—Yes, but even Sir Basil Blackett has admitted that the rise of exchange bas kept Indian prices low when compared with world prices. Even he has admitted it. What I said was whatever be the world prices when I can get Rs. 15 and get Rs. 13, it does not matter how you put it, the loss of Rs. 2 is patent and cannot be got away from. Moreover whatever be the world prices, why should our people by any manipulation be prevented from realising and enjoying the higher price which is available from world prices by any method; why should we not get the higher price if it is available elsewhere?

7173. There is no reason whatever except this that in those days when prices rose although our export prices rose and our import prices fell our exchange remained steady. That is what I am pointing to you as distinguishing this case from the case put by Messrs. Datta and Shirras.—.........Up to 1914 it was 1s. 4d.; but what I state is whatever be the exchange why should you meddle with the exchange in order to reduce our prices. It is admitted on all hands, by putting on a high exchange your prices will be lower than world prices. The persons who are responsible for it admit that.

7174. But you must look not only to the prices of produce but to the cost of production.—All those things, the cost production and the necessary things he has to purchase, have been taken into consideration. After taking all those things into consideration these gentlemen have definitely come to the conclusion that it is beneficial. Not only Sir Basil Blackett but the writers of this report also have arrived at the same conclusion, besides which all Indian economists admit it.

7175. (*Chairman.*) With reference to that, you say the persons responsible admit it. In justice to Mr. Datta it must be said that his argument has not been brought forward in the connection in which it was produced. Further, no doubt you are aware that the report to which you refer of Mr. Datta's was reviewed not wholly favourably by the Government of India who did not accept all Mr. Datta's conclusions?—Yes, in the preface they say on some points they do not accept it. I know as regards this particular point they have not said so, because at that timo the Government were anxious to say that after all high prices do not do any harm. That is their idea.

7176. So that you must not put the whole of the Report upon the Government of India?—No, I am only quoting the opinion of an officer of Government, a gentleman appointed by the Government, who cannot be against the Government.

7177. Not perhaps the persons responsible, who are ultimately the Government of India?—With reference to that with your permission, Sir, I may invite attention to the statement made by the Secretary of State both in 1879 and 1886. By this high exchange you are only saving yourself the necessity of putting the burden on the taxpayer by putting it on the producer; and Government themselves admit it. Therefore they know they are doing something wrong.

7178. The argument that a rise in world prices is beneficial to this country or another is a familiar one which should cause no surprise?—But as pointed out by another economist a person who invests a large amount such as England will always have the advantage of higher exchange values whereas a country which has to pay 50 crores annually is in a disadvantageous position if prices are low, because what is good for England may not be good for India.

7179. (*Mr. Preston.*) Mr. Raju, might I draw your attention to your supplementary memorandum* which you have just sent to us, where you say, "I cannnot persuade myself to believe that the gold exchange standard would ever prove beneficial to the country." The gold exchange standard of which you speak there was brought into force in 1893 and functioned up to 1915. From 1899 to 1915 it was the means of providing a stable rupee exchange at 1s. 4d., throughout the whole of that period?—Yes.

7180. And during that time I think it has been universally recognised, and I think you must admit also from your own point of view, that it produced a measure of great prosperity to the land of India: will you admit that?—I do not admit the inference which you propose to draw from the premises which you lay down.

7181. Did it not bring to the land of India a great amount of prosperity?—Yes. By robbing Peter to pay Paul.

7182. I am not talking of robbing Peter. I am merely asking you a question. During that period is it not a recognised fact, that over the whole of that period the country prospered to an abnormal extent?—Not on account of the gold exchango standard.

7183. Was it not due to the fact that from the period, 1899 to 1915 we had a stable rupee?—We had good monsoons; we had good production; and on account of irrigation facilities and railway facilities we were able to sell and become prosperous, not on account of exchange.

7184. That is exactly what I wanted to get at?—My reply to that, Sir, is that the prosperity of the country depended on various other factors, not at all on the exchange factor.

7185. You admit that India was prosperous any way, that she achieved a great amount of prosperity during that period?—Achieved some prosperity; I do not say that she could not have achieved more prosperity under self-government.

7186. Let us get at this. during that period from 1899 to 1915 India was very prosperous?—She was bettor than before.

7187. Then you go on to say, "I may be excused for my non-possumus attitude towards the gold exchange standard in any form whatsoever unless it is modified to such an extent as to rename it gold standard." Does that mean that, provided you have the system which was in force from 1899 to 1914 during which period India had this wonderful amount of prosperity, provided that system was renamed a gold standard, you will be quite satisfied?—That is not at all my view. What I state is this: that what every other country which is responsible to its people has not accepted should not be thrust upon us just because India is a dependency like the Philippines. You cannot put that forward as a thing which has brought prosperity to India. The prosperity to India was brought by other factors. So long as the Crown has got a monopoly of coinage, if you put in a standard coin and a subsidiary coin, I say let it be a standard coin and a subsidiary coin mutually obligatory on all sides. If, however, you want to put it only as a measuro of value which you want to change whenever you find it necessary to do so, I say it is not at all advantageous to us. We are bound to accept it because we cannot help it since we have no political authority, but it is not advantageous to us.

7188. What I am trying to bring out is this: you say "I may be excused for my non-possumus attitude towards the gold exchange standard in any form whatsoever unless it is modified to such an extent (this is your own wording) as to rename it gold standard"?—I am sorry if my language is not clear; what I mean by that is I want to modify that standard in such a manner that you can only call it a gold standard, such as is known all the world over; and not a gold exchange standard.

7189. (*Chairman.*) I think perhaps if Mr. Raju substitutes the word "reconstitute" his meaning would be clearer?

7190. (*Mr. Preston.*) I accept the wording of the Chairman: let us take it this way: "I may be excused for my non-possumus attitude towards the

* Not printed, vide footnote to Appendix No. 34.

gold exchange standard in any form whatsoever unless in a remodified form so that it may be renamed a gold standard." You accept that?—What I mean is this, whatever the particular wording may mean. I want a gold standard pure and simple, an honest gold standard such as is observed in every country which is responsible to its subjects. I do not want any other standard.

7191. (*Chairman.*) I think really what Mr. Raju has in mind is reconstitution of the existing system into a gold standard. I do not think he really means "renamed." What he wants is a gold standard. What he means by a gold standard is, of course, quite another thing.

7192. (*Mr. Preston.*) Thank you very much, Sir.

7193. (*Chairman.*) It occurs to me to ask you in connection with that, in order to clear up what your meaning is, the standard of what other country would you accept as an ideal?—I would accept England or the United States.

7194. But those two standards are totally dissimilar, are they not?—So far as I understand it, for our purpose we can make changes in our system in order to adjust our system to that of England or the United States. I have suggested that during the transition period we can adopt the course that was adopted in America of issuing gold certificates. Or, if you want it to be readily convertible as is the case in England, you could have it.

7195. (*Sir Alexander Murray.*) Just one thing: as I understand your statement, you are in favour of a lower rate of exchange even though it may mean high prices in India?—Certainly.

7196. (*Sir Alexander Murray.*) You do not argue that the high prices that were ruling at the time that Mr. Datta made his inquiry were due to a low exchange?

7197. (*Chairman.*) I think it was established that Mr. Datta was referring to higher world prices following the value of gold, and that it was not the effect of the Indian exchange at all. You must do Mr. Datta that justice.

7198. (*Sir Alexander Murray*). As a matter of fact I think Mr. Raju makes it quite clear in his supplementary statement where he says "Mr. K. L. Datta's report on Enquiry into the Rise of Prices in India will give useful information wherein he stated that rise in prices in India was due to a shortage of supply, particularly in the case of food grains."—I may be excused, Sir, for repeating myself: I said Mr. Datta's report would be advantageous in order to understand the effect of high prices, because there is a misconception that high prices are injurious to a country. In order to meet that objection Mr. Datta has specificially pointed out in chapters 12 and 13 of his report that high prices would cause some inconvenience to a smaller number of people and advantageous to a large number; and I add to that a high exchange brings in a smaller number of rupees to the producer and therefore it necessarily follows that the persons who produce will be losers; that is, a large section of the population would be losers, while a small section gets the advantage; the country as a whole does not benefit by it.

7199. Quite true: at the time Mr. Datta wrote he was not referring to the high prices in India in that they were higher than the prices ruling in other countries?—He was only speaking of the effect of high prices on various sections of the people.

7200. In India?—Yes. He was taking into consideration consumers and producers and persons dependent upon the land; he says that the larger number would be about 70 or 75 per cent. who would be benefitted and that the smaller number would be about 20 to 30 per cent. who would be adversely affected; therefore, taking it numerically I say I would prefer high prices because it is advantageous to India, in spite of causing inconvenience to a small number of people. That, I think, is what he was driving at.

7201. (*Sir Maneckji Dadabhoy.*) Mr. Raju, you spoke about the ethical objection to the depreciation of the rupee and you say that both the permanent and the ryotwari settlements are affected by the rise in the rupee, because their mutual contract is not fulfilled in the sense originally intended?—Yes.

7202. Will you please explain this a little further and let me know this: of course you know that there is a great controversy as to whether what is paid to Government is rent or revenue. Apart from that question, when the rent is paid the landlord also receives from his tenant cultivators in the same shape: so how is he affected?—What I am stating is that all those who are producers themselves will be affected.

7203. In other words, your contention is that the change in ratio is an invisible taxation on the producer?—Certainly; and not only on the producer but on all those who depend upon the land.

7204. It is an invisible taxation?—Yes.

7205. And as such it is opposed to all ordinary canons of the law of taxation? That is your view? —Yes; because if you do want to impose taxation, you can impose it directly; if you want more money for national purposes you can impose taxation on tho nation as a whole but you cannot impose it on a section.

7206. If there is any deficit by a lower ratio, it could be met by taxation of the whole country, evenly distributed? That is your argument?—Yes.

7207. You recommended an import duty on silver? —Yes.

7208. Is there not a very strong sentiment in the country against the imposition of an import duty on silver, as a taxation on the saving of the people? —Persons who had trade formerly with China and Japan now find that their Japan trade has gone and the Chinese trade is dwindling; and at the time when it was introduced a question was raised in the Assembly whether it was beneficial or not. What I say is that when India gives up the rupee as a standard coin and brings it down to the level of a subsidiary coin, naturally there would be dumping into India of cheap silver. I want to protect the country against that by putting an import duty on silver and for that purpose I think it is fair that the State also should realise some amount to help the convertibility of rupee obligations, besides preventing India being made the dumping ground for other countries of their cheap silver, which would naturally be the effect of any change in the position of the rupee.

7209. Let us carry your argument a little further: when the gold standard is introduced the price of silver will fall in the country?—Yes.

7210. How will this duty affect the general price of silver—this additional import duty?—The general price in the world won't be affected. Any silver you purchase for India you have to add whatever import duty you place on it. Therefore, when the world's silver is competing with Indian silver, it has got the disadvantage of paying the import duty. To that extent silver value will be appreciated.

7211. I don't quite follow you, Mr. Raju. Just let me put it this way. When you introduce the gold standard and make the rupee a limited tender, the rupee silver will have to be sold. You cannot lock up all that silver in the country?—No, but a smaller number of coins will do.

7212. But what about the silver which is in large hoards in the country?—The large hoards will remain in the country or they may be exported.

7213. That is why I want to be exact. If they are to be exported, the price of silver will go down. On the other hand, you contemplate an import duty on silver. How will it affect the internal silver in the country?—It would appreciate to that extent in world competition. If I have got an article here and nobody can compete with it unless he pays an import duty, to that extent the value will be appreciated.

7214. Well, you said something in speaking about the Imperial Bank of India. You said the Bank paid 24 per cent. dividends?—I said 24 per cent.

profits they have made, but only 12 per cent. dividends was given.

7215. (*Sir Norcot Warren.*) It is 16 per cent. and not 12 per cent. You are wrong?—Then it is much worse.

7216. (*Sir Maneckji Dadabhoy.*) Now, you said that if the gold standard is introduced, the amount required for conversion will be about 110 crores and we would be able easily to accumulate the gold required in a period of five years. What is your line or method to accumulate?—When you open a free mint, as we did in 1922-23 when 50 million came in, all this will be brought to the mint and it will be minted.

7217. You mean the bullion which is in hoards?—It is not in hoards. It is with the people, and they will bring it out.

7218. So you largely depend for the fruition of this scheme on the bullion which is with the people and which will necessarily be brought out because once they know gold is being coined, they will have no incentive to hide the gold?—Besides we have either gold or sterling securities to the extent of 116 crores. In the silver currency reserve and the gold reserve we have 116 crores.

7219. Your contention is that there will be no necessity for keeping up both reserves in any strength?—Oh, reserves must be kept, because when you are issuing currency notes you must have a reserve because in order to keep the fears of the people in check. As soon as you lose confidence, there will be trouble, just as the French franc has gone down from 25 to 125, so the Indian notes will go down if the people lose confidence in the Government.

7220. Then there will be another method, because by the favourable balance of your trade you can earn your gold too?—Oh yes.

7221. (*Chairman.*) I do not quite follow the argument. You see, people who hold bullion can get currency for it now. They could sell their bullion to the bullion brokers and get currency. If they do not do it now, why should they do it any more when we make a change?—When the gold coin is standard, if I have got bullion and want to raise money, I will bring in my gold. That ornament or bullion will be sent to the mint.

7222. The point is this. You are counting upon this export of bullion for the use of the people to be transferred to the mints and passed into currency. I put it to you that, at the present time, people can, if they like, get currency for their bullion, but they do not want it. They prefer to keep it in bullion. Why should not they continue to keep it in bullion?—I may be excused, but in 1900 they stated when an attempt was made to introduce currency they said the people don't want it and the currency was stopped. But my reply is that, so long as you keep a depreciated currency as practically a standard coin in the country, nowhere in the world would a higher value coin circulate. Under the Gresham's law, every country failed, because you cannot keep two things running together.

7223. My difficulty is this. You count upon, under some future conditions, people bringing out the bullion which they now import for domestic purposes to pass into the currency. It appears to me that, if they require currency, they could easily sell their bullion to the bullion brokers now. If they do not do it now, why should they do it later?—There are no mints open now.

7224. But you have only got to go and sell your bullion to the bullion brokers and you would get rupees for it?—To what purpose? Because we have still to pay our tax and have to deal in rupees. What is the object? If I can get a coin to satisfy me, it would be different. But I cannot give a sovereign to the Government and receive only Rs. 10 Why should I lose my Rs. 15 worth or Rs. 13 worth of gold? If you make it fairly advantageous to me, I would part.

7225. But that Rs. 10 ratio only applies to the actual tendering of gold to the Government. The bullion broker in the bazaar is open to purchase it and pay a little less than Rs. 13¼ for it. If there is really a desire on the part of the people, or a possibility on the part of the people, that they will convert these gold hoards of theirs into currency, if they want currency, why don't they take their bullion, which they hold in the form of bangles and gold bars, to the bullion brokers and get rupees against it?—I may mention one thing, Sir. When the agriculturists have got prosperity, when they have got a larger amount, they will utilise it and keep it in gold. But when there is adversity they will readily change if there is no loss to them by this change. If I have to undergo loss every time I change it, I prefer to do some other thing instead of converting the hoards.

7226. In the same way, when there is an open and free mint they would have to pay the seigniorage for the conversion of their bullion into gold coin. There would be a small loss, at any rate?—They suggested a small amount. But they know this much that the Government stamp itself carries weight. Because a current coin would fetch more value than the intrinsic worth by an anna or an anna and a half, and on account of the saving of trouble to ascertain the exact fineness of the gold bullion. They have confidence in the Government. Therefore they will be satisfied with gold coin.

7227. I express to you our thanks, Mr. Raju, for your very full evidence to-day?—I must express my obligation to the Commission, Sir, for allowing me as a layman to put my views before the financial experts.

7228. (*Chairman.*) It is to our advantage.

(*The witness withdrew.*)

NINETEENTH DAY.

Tuesday, December 22nd, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER, Mr. A. AYANGAR, } (*Secretaries*).

Mr. RAMACHANDRA RAU, called and examined.

7229. (*Chairman.*) You are the author of several works on banking and other matters of commercial interest, of one of which you have been good enough to supply the Commission with a copy?—Yes.

7230. I understand that you are also a lecturer in the University of Calcutta?—Yes.

7231. You have come here to-day to assist us on the matters of our reference and you have let us have a very full memorandum.* I will ask you a few questions on your memorandum to elucidate points which appear to need elucidation. In the first place, you adopt the classification, which is so commonly adopted for the purposes of considering the interests which result from currency movements, of producers and consumers. Is that in your opinion a scientific classification for economic purposes?—My idea is that these are the two headings under which the currency interests are discussed generally, and the gold exchange standard system divides the main interests under the two heads. Producers consider that a lower rate of exchange is advantageous to them; consumers consider that when there are high prices, a higher exchange would check the rise in prices further.

7232. Do not let me take you too far all at once. What I would suggest is that in looking for a scientific classification one should classify the community rather into categories which are capable of more definite use in analysis, such as debtors and creditors, buyers and sellers, each of which represents a definite contractual relation, but that the interests summarised in the word " producer " are so many and varied, as in the case of the consumer, that it hardly assists you to use those classifications in a scientific analysis. Do you agree with that?—I do admit that your suggestion is scientific, but I follow the usual procedure that is adopted and that will enable me to discuss the usual difficulties of the gold exchange standard.

7233. It is undoubtedly the usual procedure, but it occurs to me that one ought to try and improve on that procedure. You emphasize in a most interesting manner throughout your memorandum the necessity for considering this question from the point of view of credit and banking as well as from the point of view of currency, pure and simple. That is a matter to which you have given particular attention?—And I am of opinion that unless banking interests also are understood and unless the Central Bank is in a position to control the currency system, it would not be possible to have a thoroughly organized currency system satisfying all interests.

7234. Could you assist the Commission on a matter not foreign to their inquiry, though possibly remote, and that is, what practical measures can be taken to improve banking facilities in India and to increase the use of banks amongst the people?—The improvement of the banking system will first lead to the increase of capital and the increase of cash reserves on the part of Banks will enable them to increase the credits that they can dole out to industries.

7235. We may agree upon the consequences of a progressive increase in banking facilities but my question is rather by what means should those banking facilities be increased?—By asking the indigenous bankers to become full-fledged bankers undertaking deposits, and if they would also permit the people to make use of their facilities for remittance purposes, etc., and if they become closely interwoven in the banking system of the country by getting affiliated to the district branches of the Imperial Bank and become members of the district boards of the Bank, facilities for remittance, etc., would be increased to a great extent, and the very fact that they would be increasing the deposits would enable them to undertake remittance facilities on a large scale. This they are not in a position at present to do. They depend upon the Imperial Bank's own facilities for undertaking remittance business.

7236. Is it essentially necessary, in order to increase the use of banks amongst the people, to promote confidence in the stability of banks?—I have not quite followed your question.

7237. Can you hear it?—Yes.

7238. In order that people may freely use banks, they must have confidence in them, must they not?—Yes.

7239. Is it, therefore, one of the first important things to promote confidence that banks are stable?—I quite agree.

7240. Do you consider that, for that purpose, any further laws are required in India as to the regulation of banks?—You are driving me to the point of banking legislation?

7241. Yes?—I think the depositors' interests in our country can be secured by a certain amount of banking legislation. Depositors' interests can be secured to a certain extent by banking legislation, i.e., by making it criminal on the part of directors to mismanage funds, the depositors, etc., would be in a position to have better confidence in the management, and if there are certain laws as regards the regulation of the reserve, as regards the paying of dividends, and if the other suggestions in my chapter on banking legislation are followed, I think that would conduce towards increasing confidence on the part of the public. It is given in the chapter on Indian Joint Stock Companies, suggestions for banking legislation, page 97.

7242. The recommendations which you would make as to the making of the banking law more stringent are set out in this passage in your work, " Present Day Banking in India "?—Yes.

7243. Now let me come to another point in your memorandum. You refer in your introductory paragraph to the great expansion of credit machinery in the 19th century in Europe?—In England especially where there is industrial revolution.

7244. To what do you ascribe that great expansion in England?—Development of banking and the ability to develop the cheque system.

* Appendix No. 35.

7245. But that was rather a consequence than a cause, was it not, of the expansion of the banking machinery? Has it occurred to you to ask what the cause has been in England and Western Europe of the growth of the banking habit in the people?—That has increased as a result of the industrial expansion. Their increased finance and their ability to command so much deposit, these two factors are responsible. Banking capital increased and they began to provide further capital to industries. It is a simultaneous growth.

7246. May I make a little comparison between English conditions and Indian. The basis of the banking habit is, first of all, the thrifty, saving nature of a population?—Yes, certainly I agree.

7247. The people of England are thrifty and so are the people of India, are they not? The Indian people as a whole are a thrifty, saving people?—I do not think that the majority of the people are in a position to save. Those who are in a position to save, those who are educated and are in a position to save have contracted the banking habit to a certain extent of late, i.e., in the 20th century. But before that, they had no confidence in the banking system.

7248. That is different. I am thinking now of their mental habit. I should gather from your answer that, when they can save, they are willing to do so?—Those sections of the population who are able to save.

7249. One might say, might one not, that, in the second place, the banking habit in England and Western Europe was based upon security, and, in the third place, external security?—Yes.

7250. How do you compare the state of Western Europe with that of India in that respect, in view of the long history of India through past centuries?—My point here is that at that time when industries began to expand, banking mechanism also expanded in England. In our case, coming to India, although industrial expansion has taken place, there is not much of banking development, specially industrial banking development in our country.

7251. Would you agree that, owing to the long troubled history of India in past centuries, the people of India have not yet learnt the same complete confidence in the security of their country as regards foreign dangers that the people of England have learnt, and that this has an effect upon the willingness of the people to trust their money out of their own hands?—That had been he case in Englnad. But coming to our country, the fact that there had been unsettled nature specially in the later half of the 19th century is one of the causes why there had not been banking development in our country. In addition to that, there is poverty and it is this poverty that has not enabled the people to save a large amount and deposit it.

7252. I was just trying to see what the differences were which accounted for the expansion of banks in one place and not in the other?—Yes, I quite agree.

7253. Now let me take another circumstance. The banking habit in England and Western Europe largely depends, you would no doubt agree, upon the strength of the rule of law in those countries and the confidence in the complete sanctity of contracts. How would that be as regards India, because it suggests itself that, owing to the troubled history of the country in past centuries, the uninstructed have not yet learnt to have so much confidence in the rule of law or to trust to the enforcement of a contract. Does that affect progress in this direction in India?—I do not deny that. But there are other contributory causes that lead to the inadequacy of banking development in our country.

7254. Another cause which suggests itself that must affect the banking habit in any country is confidence in the stability of the value of the internal currency. How, in your opinion, has this question affected the growth of the banking habit in India?—I think I have stated that in the introduction itself, the changing value of the currency system has been leading to the later development of banking in this country. I referred to that in the introduction to the first edition.

7255. There was a substantial period before the war when the rupee remained stable in relation to gold round about 1s. 4d. Do statistics show a substantial increase in the use of banks during that period?—We had rupee stability round the 1s. 4d. rate from 1892 downwards to 1913 and 1914. During this time we had increased banking habit on the part of the people and but for the unfortunate failures in the case of the Punjab Banks it would have still further increased. But with the failure of the banks, people lost confidence and although there was stability in the rupee in the early part of the 20th century, it was the fact of the bad management of some of the swadeshi banks that dissuaded a large part of our people from depositing the little that they had.

7256. But for these unfortunate incidents, due possibly to failure to impose proper regulations upon banking, you would have expected to see during that period of the stability of the rupee a further extension of the use of banks?—Yes; there would have been further expansion of the use of banks. If there had been banking legislation protecting the interests of the depositors at that time.

7257. From the latter part of the second introductory paragraph, commencing from the words "of late," I gather it is your view that, if the exchange be stabilised in relation to gold, internal prices will automatically follow world gold prices?—Yes, that is my opinion.

7258. Is that true, or is it not equally the case whether the exchange be stabilised on a gold exchange standard or on a full gold standard?—A full gold standard system would enable us to follow the world system. It will give full play for the influence of world prices in our country. Now under gold exchange standard although we have stability, what happens under it is that the prices in our country tend to rise in advance of the prices prevailing in other countries. If we take the history of 1913, our price level has been higher than the price level in Europe or United States of America, which were gold standard countries. Our prices ought to have been following the prices of the gold standard countries; but still our Indian price level has been higher than the price level in Europe or the United States of America. So under the gold exchange standard system our Indian price level is bound to be higher because there is an export trade balance in our favour and it means automatically the injection of more rupees into our currency.

7259. Will you explain why, on a gold exchange standard, when the rupee is stabilised in relation to gold, internal gold prices will not move automatically in adjustment with world gold prices. If I may explain my question, you refer to the experience of India before the War. There one who was meeting your point would say that the Indian standard then was not a gold exchange standard; it was imperfect; there was no provision for the automatic contraction of the currency. I am asking you now about a true gold exchange standard, and the question is why upon such a standard, once the rupee is stabilised in relation to gold, there should be any tendency to departure from world gold prices in Indian prices greater than in the case of the full gold standard?—Under the scientific gold exchange standard system it is possible to arrange for the automatic contraction of currency, but in the case of our country the habits of our people are of this nature, that is, if prices in imports rise the people will not be in a position to consume the imported goods and the rupees that have once gone back into the country will not be in a position to automatically return and the scientific nature of the exchange standard, so far as contraction is concerned, is likely to break down because our people are apt to hoard rupees and when they find the price of imports rising they will not be in a position automatically to buy the imported goods and the rupees will remain in the pockets of the peasants.

7260. If they do not use their rupees they cannot buy, and if they cannot buy then importers will not import, and if importers will not import then there is no strain upon the exchange; so why should the system break down under these conditions?—Under the gold exchange standard there might be automatic contraction, at least under the scientific gold exchange standard. Now the habits of our people are such that they would automatically withhold buying commodities if the prices rise. If they find that the price level is rising to a great extent they would not be in a position to buy the imported goods; so there is no question of the automatic nature of the gold exchange standard system in working.

7261. You proceed to describe various features of the present currency situation. In paragraph (*e*) you say "The expansion and contraction of currency can be brought about by the discretion of the Government alone; the banks' power in this matter is very limited." That is saying,, is it not, in other words that, under the present arrangements, there is in fact not a true gold exchange standard?—Yes.

7262. At the close of the paragraphyou say: "Thus the Government is at present managing the system according to their ideals." Supposing we had a full gold standard, there would, would there not, still be a necessity to make some provision for seasonal expansion of the currency?—Yes, certainly provision for emergency currency would arise under certain conditions; but the door is open for the free coming in of gold and notes issued. If the note issue itself is elastic there might be no special provision for emergency currency.

7263. I think you yourself say very truly somewhere in your memorandum that, under a gold standard, the import of gold does not come until it is too late to be of use to increase monetary facilities to meet the seasonal demand?—Under the gold exchange standard I have stated.

7264. That is a feature of any and every currency system, that it requires some special provision for seasonal expansion?—Yes.

7265. Such provisions for seasonal expansion must always entail, must they not, some degree of management and control by a currency authority?—If the banker were to be the controlling authority it would be done according to the interests of trade and the interests of the public; so if the Government were not to manage the system but to leave it to the management of the banks there would automatically be the necessary expansion in the currency system.

7266. Your objection to the degree of management involved under those conditions is removed if it be a Central Bank that is controlling the matter?—Essentially a gold standard means a gold standard under the management of the Central Bank.

7267. I am not sure that you have quite followed my question. Your objection to the degree of management involved in the control of a seasonal expansion is removed if it be a Bank that is in control and not the Government? I rather gathered that from your previous answer?—My point is that under a banking standard it is the banks that control the gold standard system and they provide the required elasticity to the currency system. Now under the gold exchange standard it is left to the option of the Government to increase the expansion of currency as it is at present being managed since 1924. You have the banker, *i.e.*, the Imperial Bank can bring about a certain amount of elasticity according to the provisions of the Paper Currency Amendment Act, but that is not sufficient, the 12 crore limit is not considered sufficient.

7268. Might it not be said that there is no reason why you should not put the control of a gold exchange standard into the hands of the Central Bank by transferring to the Bank control of the note issue and of the reserves against that issue, and imposing upon the Bank the obligation to buy and sell international currency at the gold points. What effect would such a transfer of control from Government to Bank have upon your opinion as regards the undesirability of any factor of management involved in a gold exchange standard?—That is you want to ask me my opinion about a scientific gold exchange standard system?

7269. What I want to know is whether your objection to the gold exchange standard on the ground that it can be manipulated is affected if the control of that standard be in the hands of a Central Bank and not of the Government?—It cannot be manipulated against the interests of the people if it is in the hands of the bankers.

7270. I follow then that your objection to the system on that ground would disappear?—Yes.

7271. You say in (*g*) "Tho use of the token rupee with its low intrinsic value combined with other causes has led to the hoarding of wealth which ought to have been released as industrial capital." What, in your opinion, if any, is the progress which is being made under existing conditions by the people in learning to make better use of their savings than to employ them in hoards? Do you think they are learning now gradually?—Yes they are learning under the influence of certain of our industrialists to invest their savings as industrial capital.

7272. I come now to your paragraph 3, "The Intermingling of Exchange problems with Currency." A third of the way down you say, "In the case of India the Government has undertaken the management of the exchange value of the currency, considering it to be more important that the stability of the commodity value of the rupee for internal purposes." I imagine that it would be said on behalf of the Government that they had undertaken this with the object of stabilising the gold value of the rupee?—This policy of stabilising the gold value of the rupee, that is attaining stability in the price level, has been the ideal since 1924. In pre-war years what they thought of was stability of the exchange value of currency and the price level specially had not been the chief consideration of Government. That refers to pre-war years. Since 1924 they have been pursuing this ideal of stability in the price level.

7273. But we have already agreed, have we not, that if you stabilise the gold value of the rupee by any means, you then link internal prices to world gold prices?—Yes.

7274. Is not, therefore, stabilising the gold value of the rupee the best, and indeed the only effective, measure that can be taken to stabilise internal prices? —But stability of exchange also is a criterion in managing the currency system. If stability of internal prices is obtained by raising the exchange value, as it has been done now, the people object to raising the exchange. We have obtained stability of gold prices in our country by raising exchange and by the automatic contraction of the currency, and this would not be liked by the industrialists and traders.

7275. I gather that you are not yourself in favour of any attempt to stabilise internal prices in distinction from world gold prices by the adoption of such a policy as that which is associated with the name of Mr. Maynard Keynes?—Yes; that system of management would not be possible in the present state of the banking system in our country.

7276. That being so, the greatest measure of stability for internal prices that can be attained is to link them to world gold prices, is it not?—Yes.

7277. In order to effect that, exchange must be stabilised at some rate, must it not?—Yes.

7278. Is it your contention that the rate was raised to 1s. 6d. by a definite manipulation on the part of the currency authority in India?—That at least is the prevalent opinion and I concur with tho prevalent opinion.

7279. Let me put to you another point of view that has been put to us in evidence, that exchange was rising under natural causes, and that all that was done by the currency authority was to choose what seemed a convenient moment to intervene and to commence an effort to stabilise the rupee?—But they lost the opportunity of stabilising it at the old rate, which is understood to be the rate which ought to prevail. When the people asked tho Government to stabilise

at 1s. 4d. the Government said that it was not their policy to stabilise it at that rate.

7280. On this matter you do not, I understand, disagree that it was necessary for the currency authority to intervene at some point in order to achieve stability?—No.

7281. From 1900 to 1913 you say India enjoyed stability of exchange, barring 1907 and 1908. But, you say, this has been accomplished by placing more rupees and inflating the Indian price level at the ports to the level prevalent in England. Now, might it not be said that what was happening was that the gold value of the rupee was stable, and was being kept stable, and that the result of that was quite automatically to keep Indian gold prices in adjustment with world gold prices, and that, so far from there being any inflation, what you were seeing was the natural adjustment of Indian internal prices to the movement of world prices necessitated by the stable gold value of the rupee?—If gold had flowed into this country from England there would have been a contraction of gold in England and on account of that contraction in England there would have been a resultant change of prices in England. That change was not to be had on account of the gold exchange standard system.

7282. I will ask you a question on that later on, if I may, because it comes more relevantly later on. It has been said that, owing to her geographical and historical position, prices in India had remained, during the end of the nineteenth and the beginning of the twentieth century, with a lag behind those of the prices of the world, and what we were seeing during this period was Indian prices overtaking this lag as India was brought into closer communication with the rest of the world. What is your opinion on that point of view?—That is one cause of the rise in prices in our country.

7283. I am not quite sure that I follow your argument at the end of this paragraph. Is it the case that this argument here means that you advocate that exchange should be left to look after itself?—Certainly.

7284. Without any control by any currency authority?—Under the gold standard system exchange will have its own automatic pars and it will be linked with the gold par at the export and import points. So if we have a gold standard it will automatically look after itself and there will be no question of exchange being stabilised under the gold standard system. It will automatically get itself linked to the gold points.

7285. What is to happen pending the introduction of the full gold standard?—In the interregnum there should be some measures for the stabilisation of exchange.

7286. I had misunderstood you: you do not mean that, pending the introduction of the full gold standard, you would let exchange look after itself?—I would not.

7287. You say that stability of exchange is important only from the standpoint of the Government. Is that really so? Is it not also of importance from the point of view of the commercial community, and, through them, of the growers of produce? Can external trade flourish with a fluctuating exchange?—Stability of exchange for trade purposes is an important facility, but not an absolute condition.

7288. Then I may mentally make that little addition to your statement here that stability of exchange is important only from the standpoint of the Government?—Yes.

7289. You proceed to analyse the defects of the gold exchange standard. You say in paragraph 1 that the gold exchange standard has thus an inherent tendency to inflate the price level. From your previous answers I gather that I should read there thus: "the gold exchange standard, as it was in force in India before the war, had such a tendency"?—Yes.

7290. Has a perfected gold exchange standard necessarily such a tendency?—A defective gold exchange standard has this tendency, that is what I say.

7291. By a perfected gold exchange standard I mean one where the reserves are unified and there is an established legal relation between the reserves and the whole of the outstanding token currency. That is one essential feature. The other essential feature is that the currency authority undertakes a legal obligation both to buy and to sell international currency against the local currency at the upper and lower gold points. Considering such a standard, has such a standard any inherent tendency to inflate the price level?—No.

7292. Secondly, you say the gold exchange standard leads to an accumulation of reserves in a foreign centre. The question which suggests itself is whether that is a necessary feature of a gold exchange standard or whether under a gold exchange standard your reserves might not be equally held in India?—They might be held in India in gold but they must be held in readiness to liquidate our national indebtedness at any time. Promptness is necessary; it is this promptness which has forced the Government to keep it in foreign centres so far. It is one of the chief reasons why we supported the gold exchange standard because the reserves could be held in a foreign centre.

7293. If under your gold exchange standard you kept a gold reserve in India, as regards promptness it would be precisely on the same footing as a full gold standard?—But the experience of 1907-8 was against promptness. That is why in 1914 the Chamberlain Commission had to say that this selling of the reverse councils at this lower limit was a necessity.

7294. You see what I am doing now is trying to see how these disadvantages discriminate between a true gold exchange standard and a full gold standard, and the question is this—it is desirable that your reserves should be promptly available?—Yes.

7295. Let me correct that. It is desirable that your means of international payment should be promptly available? If under a gold exchange standard you hold your gold reserves in India, as regards promptness are you not in precisely the same condition as you are under the full gold standard, if the gold has to be exported?—Yes.

7296. We have dealt with the similarity of the systems as regards the expansion of currency taking place after the event, that is No. 4, and we have dealt with No. 5 as regards the possibility of making a gold exchange standard automatic. You say at the end of paragraph 6:—"The price level of England suffers no change on the sale of Councils, as gold has not left its shores, but is allowed to lie in the hands of the British bankers." Could that difficulty be met, or could it not, if under those conditions gold were always to be earmarked in England against the Indian reserve for the Indian reserve?—They are added to the Secretary of State's balances, and these are kept deposited in the hands of the bankers, or in the Imperial bank now. If they are earmarked in the Imperial Bank there would not be this defect.

7297. No. 7—"It impedes the people from obtaining gold to the full extent of the favourable balance of accounts." Is the ownership of gold in itself an advantage, or is it only an advantage in the purposes to which the gold can be put?—Yes, if you can make use of the gold and buy commodities from outside, it will be of much advantage, but when we sell commodities, gold should be coming into the country. Under the gold exchange standard system we are taking our return in silver and not in gold. Under the gold standard system we will be taking our return for commodities in gold. Of course, commodities should pay for commodities in the end.

7298. But you are not proceeding upon the view that the ownership of gold is an end in itself?—No, gold is not an end in itself. Gold is a means to an end.

7299. You recognise that the habit of mind in India that gold is an end in itself is one of the great difficulties which we encounter, and, indeed, one of the evils for which we seek a remedy?—As the people are not in a position to obtain the gold whenever they require it, they think that the acquired gold should not be parted with. So they are keeping it as an end

in itself. If they were to obtain the gold whenever they required it, they would be willing to part with it. Then they would not consider gold as an end in itself.

7300. That is a view which has been put before the Commission with much force. Now, paragraph 8:— "The locking up of the reserves in separate vaults for different objects only tends to withdraw these much-needed funds from the capital market of the country." Could that not be met, under such a perfected gold exchange standard as that to which I have referred, by the unification of the two reserves and placing them in the hands of a central bank? Would that overcome this disadvantage?—If that is forthcoming, if there is a unification of reserves in the country, it would be an advantage. Under the gold exchange standard system there is no such unification.

7301. Is that an essential feature of the gold exchange standard system? Is it not possible under an exchange standard to unify the reserves, reckoning into account as a liability against the reserves some estimated amount in respect of the possible contractability of the rupee circulation outstanding?—After the war the theory was that all the reserves had separate functions to perform, and that in the event of an unfavourable exchange they had a desire to unify in respect of exchange. Until then they had considered each reserve had a separate function to perform and utilised that reserve for that essential purpose. If there is a unification of reserves, it would be possible for the expansion of credit in the country. That is the meaning.

7302. We know, do we not, that before the war practice frequently showed the untenability of that theory of the separate functions of the reserves, because the gold standard reserve did, in fact, serve the purpose to some extent as a support for the note issue, and the paper currency reserve did, in fact, to some extent serve the purpose of a support for exchange?—Yes.

7303. The practice was too hard for the theory. You go on to say in No. 9: "It renders possible the spiriting away of reserves from the country by the sale of unlimited councils." Would that disadvantage be eliminated if the central bank were in charge of the currency and had imposed upon it this legal obligation to buy and sell at the upper and lower gold point respectively?—**Yes.**

7304. Then No. 11: "The Gold Exchange Standard system," you say, "is after all a half-way ideal." Is that quite the common view in Europe at the present time, that it is only a half-way ideal? Is there not some evidence that it is now beginning to be regarded as the permanent system?—In the war-worn countries, of course, whose finances have been adversely affected by the war, this would be the case.

7305. What about our system in Great Britain? Is that not, in effect, a gold exchange standard?—Yes, but they have established the principle of the gold standard, I think. It is not an effective gold standard, but they have established the principle of the gold standard.

7306. The standard established in practice is, in substance, Ricardo's standard, is it not?—Yes.

7307. Now let us take No. (1) in the following sequence of paragraphs. You say: "The gold exchange standard is not economical as it necessitates the laying down of reserves." You do not get rid of the necessity for reserves of some sort under a full gold standard, do you? Your criticism here of the exchange standard is that it is not economical as it necessitates the laying down of reserves, but under a full gold standard you will still have to keep reserves of some sort, will you not?—Yes, we have to keep the reserves, but they will not be misused. The contention is that the reserves are being misused.

7308. If it were possible to have an exchange standard which was automatic and knave-proof, this objection would fall to the ground?—Yes.

7309. After a discussion of alternative standards, which is of interest, we come to your gold standard system in Section VI. You say that the gold standard system would tend towards an unlocking of the small hoards. Would you expand that and tell us in what way that effect will be brought about?—The very fact that gold would always be available means that gold would be looked upon as industrial capital. It would not be held as jewellery or other ornaments. Hanging them on the ankles of their daughters or their wives, and suchlike practices would be given up, and only when gold is required for certain social and religious purposes, as it is being used at these functions, would gold be held till that function arrives.

7310. Would you look upon this as an immediate consequence, or would it take time for this change to be brought about?—It will take some time to educate the people to give up this habit.

7311. During that transitional period, what, in your opinion, would be the effect of making gold freely available? Would it lead at first, or would it not, to an increase in the hoarding of gold?—There would not be an increase in the habit of hoarding; generally that will tend to be less, by breaking them into fragments and their being thus utilised for industrial capital. There can be no further increase of hoarding, especially if the coins, etc., are immediately convertible into gold bullion as required.

7312. You would like, then, to see an immediate beginning in the change of the age-old habit of the Indian people to hoard gold when they can get it?—They would hoard gold when they could get it, provided there is no assurance that they would get it when required. If there is an assurance that they would get gold, I think there would not be hoarding.

7313. You think that hoarding would at once begin to diminish and that there would be no initial draining off into hoards of the new gold made available as currency?—The new gold currency that might be placed would certainly circulate in the bigger cities where the coin would suit the needs of the people; if they were to fall into the hands of the poorer people in the interior of the country, they would not be in a position to give back the coins.

7314. Up-country you would expect some of the gold to be held up?—For a little while.

7315. Now we come to the question of the effect of this policy upon the general level of prices in the world. Have you been able to form any estimate of the amount of gold which it would be necessary to add to India's supplies in order to introduce the policy?—If we take the last year's experience—we had the Controller of Currency's Report just published, and we find something to the effect of 75 millions had been added as a matter of fact to India's requirements of gold, but that is a fitful thing and it is not possible to make any accurate guess as regards India's requirements of gold. A favourable trade balance is the thing on which we can base our estimates.

7316. What we have to consider is, is it not, perhaps capable of more accurate estimate? You propose that the silver rupee should be declared a token coin and limited legal tender?—Yes.

7317. But I understand you are of the opinion expressed in paragraph 7 that it is not essential to undertake the conversion of the existing stock of rupees into the standard gold coin to be adopted. Do you not think that there might be just cause for complaint among those who hold rupees, for instance, in hoards, if you diminished their value by declaring them limited legal tender without, in the first place, giving them an opportunity of exchanging them for gold?—I have made provision for the gradual demonetization; I have stated elsewhere that there should be a gradual delimitation of the legal tender quality—for instance, you might begin with Rs. 1,000, then Rs. 750, then Rs. 500, then Rs. 100. There would be opportunity for these people to convert them.

7318. Will there be an opportunity for them, however gradual you make the process, to convert them without loss, because as soon as it is known that the rupee is no longer to be legal tender, even though the process is a gradual one, will it be possible for them to get rid of their rupees out of their hoards without a substantial loss?—If there is no further addition to the rupees, the limited stock will command a value.

There is no reason why there should be a fall in the value.

7319. To whom will they get rid of them?—They have got a limited legal tender quality and they will be submitted to Government in payment of their dues. Especially the poorer people will be submitting them to the railways and they might be submitting them in small quantities to the offices.

7320. But, *ex hypothesi*, since these rupees are in hoards they are not required for circulation. There are enough rupees in circulation for the payments of the country without them. How can they get rid of their hoards in the course of ordinary payments?—You mean to say that the rupee stock in circulation is sufficient to meet the needs of the people? If that were the case, they would not be losers at all. If the rupee were to circulate, there would be no question of loss if the rupee were declared legal tender.

7321. To understand the process, will you tell us, in your opinion, what the holder of a rupee hoard will do with his rupees? If he uses them for his ordinary payments, then he has his ordinary rupees left on his hands. Where would he go?—You mean how he would dispose of his hoards?

7322. I am thinking of one who holds a substantial hoard of rupees?—If there were not the question of conversion, he would be a loser. But then he can gradually get rid of it by means of the fact that they are limited legal tender placed in the hands of people, gradually.

7323. It seems as if, by varying the process, you would only make it a gradual loss instead of an immediate loss. Might not the complaint against a gradual loss be just as legitimate as against an immediate loss in the case of the big rupee hoards?—But when the gold standard is established.

7324. You mean that, during the interregnum, you would only recognize a limited right to convert according to the option of the Government or the currency authority?—Yes.

7325. But ultimately you would accept for the currency authority the obligation to convert rupees into gold?—Yes.

7326. That is one element that we have to consider in considering the amount of gold which India would require. The other element is, is it not, the amount of gold which would be required for active circulation? In considering those two things, have you been able to form any estimate as to the amount of gold that would be required altogether to put the policy into force? The question is, what additional amount of gold India would require for those two purposes, for circulation and for the ultimate conversion of the silver hoards?—That depends upon the present estimate of the silver hoards in the country. The people think that say between 200 to 300 crores are roughly in circulation, and from the year 1835 one authority says that about 647 crores of rupees have been minted, a large part of which might have been melted, but still about 200 or 300 crores may be presented for conversion into gold; and that depends upon the ratio which would be fixed for the purpose of conversion. If we fix 1s. 4d. somewhat less gold would be required; if you fix 1s. 6d. a larger stock of gold would be required for the purpose of the conversion of rupees into gold.

7327. Have these considerations enabled you to arrive at any figure as to the amount of gold that would be required?—Generally it is a question of guess work, and it is not possible to estimate what would be the exact amount of gold required for undertaking the full conversion. I should say, 20 crores to 30 crores.

7328. Admittedly any such estimate contains many elements of hypothesis as to the amount of rupees in hoards and so on?—Yes.

7329. Nevertheless it is a very material consideration when one is confronting the practical introduction of the standard, is it not?—But if a country has to come round to a gold standard, it has to undertake a lot of suffering in this respect.

7330. Let me ask you to accept for the purpose of our discussion a figure which has been supported before us by evidence, that is, that the amount of India's stock of gold for the purpose of introducing this system would have to be increased by about 100 million sterling. I am not asking you to accept the figure; I am only asking you to accept it for the purposes of our discussion. In section VI you say: "India's going over to the gold standard system would tend to balance and augment demand and keep up the level of the value of gold." Have you been able to satisfy yourself, in view of the outlook for the world's supply of and demand for gold, that such an additional requirement as that to which I have referred would have no more effect than to keep up the level of gold prices, and that it would not have an effect in disturbing gold prices to a very appreciable extent?—Even supposing India disturbs the level, I think India has the right; and when they demonetised silver they did not consult the interests of India. Similarly we need not take into account the other disturbances. India considers her own interests.

7331. Freely recognising that India has the right to take any action which she can take, and looking at it entirely from the point of view of Indian interests, have you been able to satisfy yourself that the additional requirements of India for gold might not produce such a disturbance of general gold prices as would have a very harmful effect upon India's own interests?—I don't think so. If you take real favourable balance of trade into consideration, there would not be such a wide prejudice affecting the price level.

7332. Have you considered the various estimates which have been made by competent authorities as regards the outlook of world's gold prices in relation to the world's demand for gold?—I have seen Dr. Gregory's estimate and also the estimate published in Economics of the Gold Standard by Mr. Jack. Barring these, I have not seen any other estimate as regards the future supply of world's gold and the future demand for it. These are the two estimates that I have seen.

7333. What do you deduce from those estimates?—You mean the conclusion that I arrived at from a study of the estimates?

7334. Yes?—Even supposing that gold would not be sufficient, there are several means of economising the gold store so that it might be sufficient to the interests of the country. If gold were to be produced in such large quantities there are measures for limiting the stock of gold so that it does not affect the price level.

7335. Those are the measures to be taken by other nations?—But they would have to consider the interests of India. I think international discussion is better than each country trying to base its own discussions on the value of gold.

7336. Might not a critic of your proposals say that that would mean that, as a consequence of this action, other nations were adopting a more economic policy, while India was adopting a more expensive policy?—That paves the way to the economical system. First of all the Indian people will handle the gold coin and later on when the gold note is placed in their hands, they will have faith in the gold standard system. The system of an economical gold standard cannot otherwise be understood.

7337. But, in the meanwhile, your critic might continue: Is this not placing India at a disadvantage if she is adopting a more expensive system, while her rivals and competitors in trade are adopting a more economic one?—If we do not adopt the gold standard, there is the question of hoarding of our money and no industrial development takes place. But if we adopt the gold standard, it is quite possible, although a certain amount of capital might be locked up for the purposes of currency, still industrial development will be taking place, so that ultimately India's interests will not suffer.

7338. I understand it is your opinion that the end would justify the means?—Yes.

7339. Referring once more to the various estimates, let me refer you to estimates made by the Harvard Economic Service, by Sir James Wilson, and by Mr. Joseph Kitchin in addition to those made by Mr. Gregory?—I have there referred to Jack's Economics of Gold Standard.

7340. Would you take it from me, for the purpose of our discussion, that these estimates as to what is to happen to gold prices are extremely variable, mostly estimating a fall in prices in the course of the next five years, but all arriving at different results as to what the tendency is going to be five years hence, whether to rise or to fall. Now if that be so, would not that teach us at any rate to be extremely cautious in assuming that the world's supply of gold is going to be equal to the world's demand for gold?—Then there will be expedients for the economising of gold. If the world's demand is greater than the world's supply, then there will be expedients for economising the gold store on the part of the banking system.

7341. If India, under those circumstances, is not economising but making this great additional demand for gold, ought we not to look upon it as at any rate a possibility that this demand might have the effect of a great upset in world gold prices?—Provided the world's demand is greater and India goes on adding to the demand, and if the world's supply is quite insufficient, then there might be this upsetting.

7342. At any rate we recognise that this is a question which has an aspect which concerns the interests of India, and that it is not a question which has to be considered only from the aspect of the interests of the world at large?—I first of all consider Indian interests and all calculations should be based on India's interests. Provided they do not prejudice international interests to a certain extent, they should be adopted. Even in case international interests should be prejudiced, I think that India should stick to her own interests.

7343. The immediate question is this—that we have, I think, arrived at the point that Indian interests are involved in avoiding any great disturbances of the world's gold prices just as much as those of any other country?—Yes.

7344. Just a few final questions. You expressly state you are in favour of handing over the note issue to the Imperial Bank and that the paper currency reserve should be amalgamated with the bank reserve. I do not understand what you mean by the paper currency reserve being amalgamated with the bank reserve. I understand you are against the separation of the note issue department from the banking department? Is that the meaning of the recommendation?—Amalgamated in the sense that it should be handed over, not in the sense that there will be two departments practically in the same hands. I used the word "amalgamated" rather loosely. I withdraw that word and substitute "handed over."

7345. For the sake of unity of control and the facilitation of the supply of credit to the trade of the country, you desire to see the control of the currency reserves and the banking reserves of the country in the same hands?—Yes.

7346. Then as to the ratio, you say: "the old rate of Rs. 15 to the sovereign need not necessarily be accepted. The recent rise in the gold value of the rupee should not be unnecessarily lost sight of or given up for the old rate"?—Yes.

7347. Your final recommendation is that the financial policy of the Government of India should rest solely in the hands of the Government of India?—Yes.

7348. (*Mr. Preston.*) In section VII, second paragraph, you say, "Secondly, Mohurs and half-mohurs of the same weight and fineness as the British sovereigns and half sovereigns should be minted and declared unlimited legal tender;" and then you go on to say, "The increase of population and expansion of the business needs of the community require an annual addition of stock to currency and this addition in the future would have to be made in gold." Is it your intention to have a gold coin of the mohur denomination introduced at some period into India?—That is gold coins of the denomination of mohurs and half-mohurs should be introduced.

7349. If you turn to section VI, you say, "The matter would have been simple if the gold unit were to be a suitable medium for the country but considering the low level of our incomes and the low cost of our basic requirements no gold coin can afford to oust the present silver rupee from circulation." This is rather contradictory to your first statement?—I will explain my inconsistency thus. There are certain sections of the population to whom the gold coin would eminently be suitable for the purpose of circulation. There are, say, 90 per cent. of the population to whom the continuation of the rupee would be a sort of advantage. But gold coins should be introduced. Otherwise people would not be in a position to understand that the gold coin is really in operation. Gold coin is necessary for the purpose of the people coming into contact with it. They will handle the coin and there wlll be the psychological confidence in the people if they begin to handle gold coins. They would think that they are under the gold standard system. Otherwise, if they are not allowed to handle them, they think that they practically are not in the gold standard system. So those sections of the population who have got riches enough and who can use gold coins, for them the gold coin will be a suitable medium and for this purpose a limited stock of gold coins can be minted. In that way it will be a small part of the circulation of our country, the gold coin.

7350. Then accepting the statement that two-thirds of the people of this land are agriculturists who would not be able to use the gold coin, therefore these gold coins you intend to bring into being will be more from a matter of form than for general utility. I will go back to another paragraph just above which is on the same subject. You say "The demand in India is more for the metal gold than for the gold coin, and hence these would find their way to the melting pot or fall into the hands of the bullion dealers." You mean that they would ultimately pour into the hands of the bullion dealers or probably be hoarded?—Yes. I beg your pardon. There is another statement which says that the education of the people will go on at the same time as the standard of living increases and banking is developed by the attempts made to introduce the gold standard.

7351. That will be the result of education ultimately you mean?—My meaning is that provided this happens there will be some possibility for the gold coin to circulate and the present tendency of the gold coin to disappear will be defeated. In the meantime if it is issued in very large quantities beyond what the 10 per cent. of the population can circulate the gold coins will go into the melting pot.

7352. Now might I take you back just a little more to section III, in connection with a reply you gave to the Chairman. I think the reply was that stability of exchange was most important from the standpoint of Government, and you say here from the standpoint of obtaining capital the stability of exchange is not so important. I am just taking that as a statement. Will you not admit that one great incentive to bringing in foreign capital into any country and particularly into India which is so much in want of foreign capital is that you should have a stable rate of exchange? Let me put the case to you like this. Supposing money in London is 4 per cent. and there is plenty of money about; and money in this country in a tight season begining with this December is 8 per cent. and that 8 per cent. would go over a period of 6 months, therefore if you could get money in

London at 4 per cent. and bring it out to India at 8 per cent. there would be a clear profit of 4 per cent. to the gentleman bringing it out from home. But the man at home says "Why should I send my monoy out if I am going to lose in exchange. In other words, if you will guarantee me that I will not lose in exchange I will give you plenty of capital." You admit that? Then taking that and working from that basis would it not be a great advantage from the point of view of attracting capital to this country to have a stable rate of exchange?—Yes, I admit that foreign capital is absolutely essential to the work of development in this country, but my contention is that with the exception of floating capital no definite investment of foreign capital would be made in this country at present, and for a definite investment of foreign capital this question of the stability of the exchange would be taken into consideration.

7353. Now last year about this time one of the great difficulties in bringing foreign capital into this country was that if you brought capital into this country by trying to cover your forward exchange you lost sometimes as much as 3 per cent. which made the operation impossible, and that was due to the uncertainty surrounding the point as to what Govern-

supposing they were operating on behalf of Government, to deal with these requirements by public tender, or as they have been doing lately by the Imperial Bank purchasing in sterling.—By public tender would be better.

7359. Thank you. I think there is only one more point. This is where a correction is needed. You say "The gold standard reserve is the only reserve for expanding currency." You mean contracting, don't you? I think we should alter that.—Yes. The next sentence shows that I had practically the paper currency reserve in my mind.

7360. (*Sir Maneckji Dadabhoy.*) You have recommended the full gold standard and when that is brought into practice, of course, demonetisation of silver will take place, and you have recommended a gradual demonetisation of silver. Will you explain what you mean by gradual? How long will the process take?—Gradual demonetisation means gradual limitation of the legal tender. If I used the words "gradual demonetisation" I wish to withdraw that.

7361. But the silver which will come out in large bulk must suffer in its price. Have you any suggestion to make in that connection, how to avoid the loss?—There is the question of conversion when the

7370. I will not pursue this point further. In your opinion the gold exchange standard has contributed to keep up the internal prices at a higher level than in other countries, has it not?—Yes, that is the prevalent opinion.

7371. Do you think that a gold exchange standard reconstructed and removed of its present imperfections would help us in any way?—First of all the people have no confidence even in a perfected gold exchange standard system. It depends upon popular confidence. If there is no popular confidence in a currency system, it is difficult even for a scientifically adjusted standard to work successfully in operation. Just as politically dyarchy is not liked by the people, similarly the people do not have faith even in a so-called scientific gold exchange standard.

7372. Am I to understand that there is sentiment opposed to it?—Yes.

7373. You do not think there is anything intrinsically wrong with the system itself?—No, theoretically speaking, you have to admit that the ideal gold exchange standard system is very good machinery.

7374. In other words the result of your discussion is that you cannot devise a gold exchange standard which would be altogether knave-proof, is that so?—Do you mean to say that a scientific gold exchange standard could be knave-proof, is that your idea?

7375. Can you perfect the present gold exchange standard to a degree which will remove mismanagement and make it absolutely proof against all sorts of trickery or devices?—Theoretically speaking, it could be made.

7376. On what basis?—On the two ideas given to us by the Chairman, buying and selling of gold and the other idea that he gave us.

7377. Can any objection to the gold exchange standard, that it is a managed currency, be averted by the control of the whole system heing handed over to the bank and not left with Government?—If a contral bank were to undertake the management of the gold exchange standard system it will perpetuate the present position of the rupee, and the people would still be dissatisfied. What the people require is gold.

7378. You say that the people will be satisfied with nothing short of a full gold standard on account of their peculiar prejudices and habits, is that your idea?—Yes; that would be the trend of public opinion.

7379. (*Sir Maneckji Dadabhoy.*) Will this gold standard increase further the hoarding habits of the Indian people? What have you got to say to that?

7380. (*Chairman.*) The witness's reply to that was that he looked for an immediate effect upon the hoarding habits of the people, that gold might disappear when it went up-country, but not in the big towns, and that elsewhere he looked to the effect being immediate in tending to reduce the habit of hoarding?—The gold that goes up-country might be hoarded to some extent, but that which trickles to the up-country will be very little; so practically we can say that that should not stand in the way of a gold standard and a gold currency, or that gold hoarding would ultimately stand in the way.

7381. (*Sir Maneckji Dadabhoy.*) At an earlier stage of the examination, in answer to the Chairman, you said something about the depositors' interests not being watched by the banks: I put to you a specific question. Have you any reasons to say that the depositors' interests are not wholly safe in the hands of the Imperial Bank of India?—People are not dissatisfied with the management of the Imperial Bank; they are quite satisfied, and the interests of the depositors are quite safe.

7382. You think that the interests of the depositors in the hands of the Imperial Bank are quite safe and the people are quite satisfied?—Yes.

7383. There is no legitimate cause for any grievance on that point?—People have got no complaint on that score; their complaint is about Government handing over all their balances to the Bank free of interest.

7384. The people think it is objectionable for Government to hand over all the balances to the Bank without interest?—That is what the people say.

7385. Do you share that opinion yourself? I want your personal opinion?—Taking the low state of banking standard in our country, I think it is advisable on the part of the Government to part, say with one or two crores, to approved banks on first class securities if they are deposited with the Government. That has been practically the measure that was asked by Mr. Chuni Lal Saraya, and it has been repeated by Mr. Vidya Sagar Pandya before the Chamberlain Commission.

7386. Let us stick to the point. I only want a reply to my present query. You think Government is not acting safely in trusting their balances to the Imperial Bank?—It is not a question of safety at all; the people also want that the Government should help the better developed Indian banks by giving them free deposit of Government money.

7387. You mean to say that Government should lend not only to the Imperial Bank but to private banks as well?—Not to private banks, but to some of the important banks on approved securities.

7388. What do you mean by important banks?—Strong banks, like the Central Bank of India or the Bank of India; if they apply for loans on securities, they ought to be given money free of interest just as the Imperial Bank of India gets it.

7389. Do you know that the Imperial Bank of India renders service to Government in lieu of getting theso balances without interest?—Of course, it is rendering service; but the very fact that it is acting as Government's banker inspires confidence psychologically in the minds of the people and that is in itself a return; the bank gets more in the shape of deposits from the people.

7390. Is it not a fact that people in India are getting more accustomed to banking habits in the use of cheques, etc., especially in the bigger towns?—In the presidency towns I think there is to a certain extent circulation of cheques; when peoplo go to buy certain things from European firms there is no objection to accept a cheque; but if you go north of Bow Bazar and give a cheque for any purchase it is not freely accepted.

7391. But likewise no bank will accept your cheque immediately you give it unless they know something about you?—Suppose, I buy a shawl from Jaharlal Pannalal, if they are not in a position to accept my cheque for 30 or 40 rupees, it would be practically putting me to the inconvenience of hoarding this 30 or 40 rupees and taking it in my pocket in order to pay them. If, however, they are in a position to know that my cheque will be accepted by the Central Bank of India, they would be in a position to take it.

7392. Is that your explanation for this hoarding?—Not for hoarding; I am only saying that it is a question of lack of popularity of cheques amongst Indian firms.

7393. But have you not noticed that even in Indian firms these hundis are passed very freely nowadays and one bank gives it to another bank just as is done with cheques?—The question of banker trusting an indigenous banker or a bigger banker, that is established; but so far as an outsider, an ordinary individual is concerned, if he has got a bank account and if he gives a cheque, it is not likely to be accepted by Indian firms.

7394. (*Sir Reginald Mant.*) In section 3 of your memorandum you advance certain criticisms of the past currency policy of the Government of India and you suggest that they were wrong in aiming at stability of exchange rather than stability of internal prices.—The old ideal had been stability of exchange from the standpoint of obtaining capital and giving facilities by Government.

7395. Will you let me finish my question? You will grasp the point better. When you come to section 5 you suggest various possible means of producing stability of prices instead of stability of exchange, and you reject all those methods as impracticable in the present stato of banking in the country. And you conclude that the only possible system is one which secures stability of price by means of stability of exchange. How do you reconcile that conclusion with

your criticism of the past policy of the Government?—Stability of prices can be obtained by having stability of exchange. When stability of exchange was obtained by Government in the past, there ought also to have been stability of prices. The stability of exchange that is obtained under the gold exchange standard system differs from the stability of exchange that is obtained under the gold standard system. The stability of exchange obtained under the gold exchange standard system depends on the operations of the Government and the ability of the Government to meet the reverse councils and the council bills at the requisite points and when the rupees are being infiltrated into our country as a result of the sale of council bills you will find that prices are being forced up. So that the stability that can be obtained under the gold exchange standard system is different from the stability obtained under the gold standard system. The gold standard system stability will be automatic and free in operation. The inflow and outflow of gold will be taking place. Here, although you obtain stability of exchange there is an impeded flow of gold into our country. So that there is a difference between the two stabilities.

7396. You are referring there to the old system of the gold exchange standard. I understand that in reply to the Chairman you agreed that the system might be perfected so as to produce the same effects as the gold standard. So that your criticisms in Section III are really only criticisms of the defects in the previous gold exchange standard? Is that your position?—Yes.

7397. Now turning to section VI of your memorandum, in discussing the possible effects of a demand for gold for India, you say that, if India did not come into the gold market, "If the gold production were to be heavy and if industrial production were not to increase there would be a fall in price and it might act as a check to productive enterprise." Now, if there were a redundancy of gold in the world, the effect would be a rise in prices and a stimulus to productive enterprise.—I have sent in a correction—it is a mistake of the typist.

7398. I have not seen it: may I just look at it? Then the effect of the demand from India would be to check the rise in prices and to reduce the stimulus to productive enterprise?—Yes.

7399. (*Sir Purshotamdas Thakurdas.*) You mention in section VII regarding the question of the ratio—you say: "Fourthly, if the Government were to decide upon fixing the exchange ratio the future ratio of exchange between the rupee and the Mohur it has to take into consideration the future possibilities of gold and silver production and carefully fix the rate." What is your aim in asking the Commission to take into consideration the future possibilities of gold and silver production?—The question of prejudicing the international interests if the value of gold is to be affected by India's demand, that was the idea in my mind when I was writing that sentence.

7400. And regarding silver?—If the fall in value of silver were to be very great in future, the Government would be the loser by fixing the exchange value at 1s. 6d.

7401. But you recommended a full-fledged gold standard. You propose to limit the rupee as a tender in due course?—Yes.

7402. That means that the demand by India of silver will decrease for rupee purposes?—Yes.

7403. You are against coining any more rupees. And therefore side by side with the future possibilities of silver production you would also say "and the future demand for silver in the world," would you not? Not only the production of silver but also the demand for silver in future?—Yes.

7404. You consider that also necessary to be taken into consideration?—Yes.

7405. Then regarding gold you are recommending a gold currency for India?—Yes.

7406. And it has been suggested that that may make India take considerable portions of gold from the world. And you have said that the other Powers which hold gold should not refuse India that quantity of gold which India may require?—Yes.

7407. And that would indicate among other things a higher price for gold?—Yes.

7408. Now, in view of these two things, namely, the possibilities of a lower price for silver in future owing to India not being a customer for silver for coinage purposes and the appreciation of the price of gold, which do you think would be the better ratio to fix and to maintain for the Government of India? 1s. 4d. or 1s. 6d.?—1s. 4d. would be better.

7409. Because there would be less gold required for conversion of the rupee and secondly because it would be easier to maintain?—Easier to maintain if the conversion of the rupee is immediatey taken up.

7410. Also lower down, under section VIII, you say: "The question of increasing our sterling obligations has to be curtailed in the near future until an effective gold standard has been operating." Why do you want our sterling obligations to be limited? Do you mean there should be less borrowing in England? Why do you want those to be limited with a gold standard and gold currency in India?—If there is gold coin and gold standard the question of limitation of the sterling obligations would be pre-supposed, and if they were asked to pay all these obligations in addition to an unfavourable balance there would be a very severe drain on the gold reserves of the country. Then it might not stand. So that if you say the majority of the obligations under this heading would be very limited and the unfavourability of balance were to appear, well, there would not be a very severe pull on the gold resources of the country.

7411. That is, in order to put as little strain as possible on the gold standard and gold currency in the earlier stages?—That is my idea.

7412. Now sterling borrowings in England are resorted to at present by the Government of India only when they find they cannot get the necessary money in India, and secondly when the scheme for which the sterling borrowing is made is urgent and important to the country, isn't it?—Yes.

7413. Then, when you ask them to restrict the sterling borrowings in the future, don't you think that you are asking them to delay schemes of public utility?—If it is possible to delay. If it is not possible to delay, they may contract obligations.

7414. If it is possible to delay. Now, regarding what you say in section VI, you realise that it might be stated that the use of gold coins can be brought about by making it compulsory that gold coins alone should be used in the payment of land revenue, excise duty and customs irrigation, etc. Do you think in India it is not possible?—Yes.

7415. Do I take it that you are of opinion that, whatever the cost and whatever slight inconvenience to the people, gold currency and a gold standard should be introduced without any delay?—Is that your conclusion?—I just want to hear the question once more.

7416. From what you say in section VI, the last part of it, I take it that it would be a fair inference from that that your anxiety for a gold standard and gold currency for India is so great that you would not mind even a slight inconvenience either to the Government or to certain portions of the people, if that was not unavoidable?—Certainly.

7417. (*Chairman.*) I do not think there are any further questions to ask you, Mr. Rau. We are very much obliged to you for your assistance here this morning and for your memorandum?—I think I should express my great obligation to the memhers of the Commission for treating me with so much consideration and excusing me for my natural defect. I thank you for the very great courtesy you have shown me.

7418. (*Chairman.*) Not at all, Mr. Rau. It is to our advantage.

(*The witness withdrew.*)

Mr. J. C. SINHA, called and examined.

7419. (*Chairman.*) Mr. Sinha, you are Reader and Head of the Department of Economics at the Dacca University?—Yes.

7420. Have you occupied that position for long?—For two years only.

7421. And before that?—I was a teacher in the Calcutta University for about 8 years, as a lecturer in Economics. Before that I was a student; I joined the Calcutta University as a teacher, two months after I got my M.A. degree.

7422. So your experience is that of a teacher of economics for 10 years and that of a student of the subject of currency?—Yes.

7423. You have been good enough to provide us with a memorandum* setting forth your opinions upon the subject of our reference, and you have also provided us with an addendum to your memorandum?—That is a mere question of calculation; that does not affect my main argument.

7424. This addendum does not affect your main argument, but it substitutes a correction in the detailed calculations in paragraph 21 of your printed memorandum. In paragraph 21 of this printed memorandum you desire to say that the additional sum required as reserve for the adoption of the gold standard has been estimated at 15 crores, the existing sterling securities in the gold and paper currency reserves having been valued at the statutory rate, but that if the rate of 1s. 5d. recommended by you be taken for this valuation then nothing would be required for this purpose. On the other hand, there would be a surplus of 3·6 crores, as estimated in the manner which you set out. Now referring to your memorandum, I find that, in the first place, you express the opinion that the times are ripe for a regulation of the currency and exchange problems of India?—Yes.

7425. You review various factors which lead you to this opinion, and you say that the most significant fact in this connection is the restoration of the gold standard in England?—Yes.

7426. I understand you to refer there to the circumstance that the pound sterling has now been restored to parity with the sovereign, and for the moment we need infer no other connotation than the gold standard in England?—Yes.

7427. In the second paragraph of your memorandum, you say: "when the price level abroad is moving up and down, we have to choose between stabilization of prices and of exchange." You adhere then to the opinion that it is impossible to achieve absolute stability both of prices and of exchanges?—Yes.

7428. If you desire to maintain an internal price stability independent of the movement of the world gold price, then you must expect exchange to vary?—Yes.

7429. If, on the other hand, you desire to maintain a stability of exchange, then you must allow your internal price to vary with the world's gold price?—Yes. But if we can stabilise the value of gold, that is, if we can regulate the output of gold and stabilise its value, then the stabilisation of prices will lead also to the stabilisation of exchange. That means control of the production of gold.

7430. Do you look upon that as a practical possibility?—No, certainly I do not.

7431. You conclude: "In such a dilemma, stabilization of price level is to be preferred in a country like India.' Taking this opinion as you express it, do I follow from that that you would set it before you as the ideal of India's currency system that you should maintain internal prices in India absolutely stable and allow exchange to vary?—Yes, if the question is decided only on theoretical grounds. But I have explained the practical difficulty of stabilization of the price level in the third paragraph.

7432. Then your opinion would be this, as I understand it, that absolute stabilisation of the price level in India would be preferable if it were possible?—Yes; it is an ideal which cannot be attained at the present time on account of various non-economic factors.

7433. But that being practically unattainable in an imperfect world, it is better to maintain exchange stable and thus to keep internal gold prices related to world gold prices?—Yes.

7434. In your fourth paragraph you say: "We have to choose, therefore, between the gold standard and the gold exchange standard. Between these two, I would advocate the gold standard with gold notes and coins in circulation, the rupee being a limited legal tender. This is certainly not the ideal form of currency but it is the best under our present circumstances." What, in your opinion, is the ideal form of currency?—The ideal will be a currency system which will maintain a stable level of internal prices.

7435. The ideal to which you are there referring is that you are referring back to the ideal of stabilising internal prices?—Yes, and for that we require paper rather than gold,—something like the Fisher scheme.

7436. That is the introduction of no new idea; it is simply a repetition of the ideas in your second paragraph?—Yes.

7437. In your next sentence you say: "I do realise that the circulation of gold coin in the place of silver means some extra cost." Have you been able to arrive at any estimate of the actual cost of such a substitution?—Yes; I have tried to make an estimate in the footnote. I have mentioned in the next paragraph that the additional cost on account of the circulation of gold will not exceed one lakh of rupees per annum.

7438. In making your estimate of cost you have taken into account that you will replace half of the active rupee circulation by gold coins?—Yes; that is rather an exaggerated estimate. But that is the maximum.

7439. Have you also taken into account any replacement of hoarded rupees by gold coins?—I have not, for, I do not think that much silver coin is hoarded now. If anything is hoarded, it is in gold.

7440. Have you attempted to form any estimate of the amount of rupees actually in hoards?—No.

7441. Evidence has been placed before us to the effect that the amount of rupees actually in hoards may be somewhere between 100 and 150 crores. Have you any comment to make upon that figure?—It is difficult to make any comment. I do not know how the figure has been arrived at.

7442. Let me tell you how that estimate has been arrived at. It has been arrived at by considering, first of all, the number of rupees actually coined, which is a known amount; secondly, estimating the number of rupees which have been melted down or recalled by Government; thirdly, estimating the amount of rupees which may be expected to be melted down by the public; fourthly, estimating the number of rupees which one may consider to be still in active circulation, the balance being the amount of rupees which must be hoarded?—But I am told that some rupees do circulate outside India. Has that factor also been taken into consideration?

7443. The rupee circulation in Iraq and Ceylon has also been taken into account. In that way we have been given evidence to the effect that the amount of rupees in hoards may be between 100 and 150 crores. Have you any comment to make upon that estimate?—It is difficult to make any comment, because some of these are mere estimates and it is difficult to say how far they are correct. It is difficult to say how much is melted. That is more or less a guess work and I cannot make one guess work upon another.

7444. You quite rightly point out that there are many elements of hypothesis involved. Nevertheless, it is a most relevant circumstance, is it not, for our consideration, when we are considering the point we are dealing with here, *viz.*, the cost of substituting rupees by gold?—Yes; but even if so many rupees

* Appendix No. 36.

remain in hoards, is there any likelihood that all these will be converted into gold? I do not think it to be a possibility. First of all I do not think that a large number of rupees is actually hoarded now. People would rather hoard gold if that is possible, rather than silver; and secondly I think that even if there is a very large amount of silver in hoards, there is no immediate danger of the rupees being converted into gold.

7445. What is your proposal for the introduction of a gold currency? How would you deal with the rupee?—First of all, we have to fix the legal tender limit of the rupee at a rather high figure.

7446. The rupee is no longer to be legal tender? —It will be limited legal tender.

7447. For an unlimited amount?—No.

7448. That being so, is it possible to make the rupee no longer unlimited legal tender, but to make it legal tender for a limited amount without giving a previous opportunity to the holders of rupees as a store of value to convert those rupees into gold?—That is not fair.

7449. Will you say what you mean by that statement that it is not fair? It will not be fair to reduce the position of the rupee without giving them the opportunity?—Yes.

7450. Supposing that it would he unfair to make the rupee no longer unlimited legal tender unless you give the present holders the preliminary opportunity to convert rupees into gold, then must we not contemplate the possibility that the whole, or a part, of the hoarded rupees will be presented for substitution in gold? Supposing we act upon your opinion that you must not limit the legal tender of the rupee unless you have given a preliminary opportunity to convert the rupee into gold, then, upon that opportunity being provided, must we not take into account the probability that a large amount of the hoarded rupees will be presented for conversion into gold?—Taking the Indian habit as it is, I do not think it will be done immediately and if we fix the legal tender limit of the rupee fairly high, I have suggested Rs. 500 for the present, there is no immediate danger of a large number of the rupees being presented for conversion into gold; much depends upon the limit of the legal tender of the rupee.

7451. What limit do you suggest?—As a mere tentative suggestion, it may for the present be limited legal tender up to 50 mohurs or Rs. 500.

7452. Let us just look at that. Supposing you make the rupee legal tender for some very large figure, say Rs. 10,000—(I am taking a large figure on purpose)—that does not effect, in fact, any dethronement of the rupee from the position of a standard coin, does it?—If it is a very high figure, it does not.

7453. Supposing you do take some figure which amounts to a practical dethronement of the rupee from its position as a standard coin, shall we say legal tender for payment of Rs. 100?—Then there may be some difficulty.

7454. Do not let us travel too far at once. My question is this. If you take any figure for a limitation of the legal tender of the rupee which, in fact, practically amounts to the reduction of the rupee to the position of a subsidiary coin, it being no longer the standard coin, does that not make it essential that, in the first place, you should give the people an opportunity of converting their rupees into gold? —Yes; my point is that this opportunity will not be taken advantage of to a great extent, if the limit is fairly high for the present.

7455. Are you not then confronted with this difficulty, that if you make the figure at which the rupee is to be legal tender so high as not to make any difference in the value of the rupee as a store of value, then you are not, in fact, making any difference in the position of the rupee as a standard coin; but, on the other hand, just to complete the horns of the dilemma, if you do reduce the limit of the legal tender of the rupee to such an amount as to effect the dethronement of the rupee from the position of a standard coin, then you are affecting its value. Is that not a necessary alternative?—Yes, but I do not mean to say that you are doing it immediately. After a few years when the gold standard is completely established, then the legal tender of the rupee will be much lowered. It is only during the transition period that the limit may be high.

7456. What figure do you propose yourself to take as the first step in the limitation of the position of the rupee as legal tender?—I shall limit it to Rs. 500 or 50 gold mohurs.

7457. The rupee is to be legal tender up to Rs. 500?—Or rather 50 gold mohurs because I make the mohur the standard coin.

7458. For the holder of the rupee the important circumstance will be that he cannot make a payment of more than Rs. 500. Would that, in your opinion, or would it not affect the value of rupees held in hoards by holders of rupees?—I do not think it will affect the value of the rupees in hoards materially because so far as these hoards are concerned they are small hoards; and big people do not hoard rupees. If as I think there are only small hoards and the legal tender limit of the rupee is up to Rs. 500 it won't affect the position of the rupee in these hoards to any great extent.

7459. Are you basing that opinion upon the assumption that there are no big holdings in hoards? —That is my idea. Rich people are not so foolish as to keep hoards of rupees, though I know some who do keep gold, but not rupees.

7460. Would it surprise you to learn that we have had evidence to the effect that there are very large hoards of silver rupees held in the country? Let me mention the particular instance of hoards held by Native States?—I have no information about these Native States.

7461. Just to test your argument, assuming that there are big hoards of silver rupees held by persons in the country, for instance in the Native States, and supposing that you yourself were in the position of a holder of a large hoard of silver rupees, would you or would you not feel that the value of your hoard was affected by the reduction of the limit for the legal tender of the rupees in your hoard to Rs. 500?—Yes, theoretically it ought to affect the value of the rupees; but I think if some people are so foolish as to hoard rupees, in these days, I do not think they will take advantage of this opportunity of converting them into gold.

7462. What I am trying to elucidate is whether we have not to contemplate that the holders of these big hoards will present their rupees for conversion as soon as the opportunity is provided, and I rather gather from your reply that you would be of opinion that if they are so stupid as to hold rupees in hoards now, they will be too stupid to take advantage of the opportunity of conversion?—Yes, I think so.

7463. I am afraid it will be unsafe to place very much reliance on that possibility, because, after all, there are always intelligent people who are prepared to tender advice, are there not?—But why did they not tender advice up to now, why did they not give them advice to open banking accounts?

7464. If you will make the assumption that there are people who hold large stores of silver rupees—(I quite recognise that you are not prepared to agree to that as a fact, but if you will, for the purpose of our discussion, make the assumption that there are people who hoard rupees)—why, in your opinion, are such hoards of rupees held at the present time? —The small hoards or the big hoards?

7465. Small and big?—With regard to big hoards, I am rather sceptical; my information is that there are none. If there are small hoards, it is because there are no banking facilities in India and people do not know how to invest their money. The other day at Dacca I was drawing some money from the post office. There was a chaprassi who had some small amount in the postal savings bank and he said "I am not going to keep my money there; I would rather hoard it." The illiteracy of the people and the lack of banking facilities are, I think, the chief reasons.

7466. Then I gather that, in your opinion, the great remedy for the hoarding habit of the Indian nation is the provision of proper banking facilities?—Yes, and the education of the masses; because even if they have proper banking facilities they must have more education to know how to take advantage of these things.

7467. How, in your opinion, should banking facilities be increased in the country?—So far as Bengal is concerned, we have so-called loan offices run by pleaders; these are not banks in the proper sense, but if we could interest our business men and start real banks with State audit it would be a good thing. I made some suggestions with regard to these things to the External Capital Committee. I have not got any clear cut scheme here now. I think that is a matter which may be discussed by the expert committee which is gong to be appointed in the near future as we learn from Sir Basil Blackett's speech. For small banks some amount of State audit and State control will be necessary. I do not know if the Imperial Bank can come to the help of these institutions because what we have now in Bengal are not banks proper but loan offices which lend money to zamindars on mortgage. There ought to bo real banks to help trade and industry. Steps ought to be taken in that direction.

7468. Before we leave this topic just let me put a final question which is relevant. If there are such hoards of silver rupees and the opportunity of exchanging them into gold is to be provided, then no doubt we must reckon the cost of substituting those silver rupees with gold as an additional cost of the scheme for introducing a gold standard?—Yes, but this cost is quite different from what I have calculated.

7469. And this is additional?—Yes, if there are hoards of rupees ready for conversion. Speaking generally, the cost of substitution is a more or less permanent factor which must always be faced, unless we can replace gold mohurs by notes.

7470. The cost of replacing notes is additional to the cost to which you refer here of substituting rupees by gold in circulation?—Yes, but as explained in my memorandum, I do not think notes will have to be substituted by gold, and so I have calculated only the cost due to the wear and tear of the gold coins.

7471. Then I see in paragraph 9 you say that under a full gold standard the currency will become more automatic. Could you assist the Commission by describing how the full gold standard is more automatic in its operations than a scientific gold exchange standard?—For example, suppose there is an adverse balance of trade then gold may leave the country as a matter of course and there need not be any selling of reverse councils by the Bank; or if there is a favourable balance of trade gold will flow into the country through the banks. It does not require the selling of council bills which it is believed, are sometimes sold at too high a rate and sometimes at too low a rate. All controversies about rates will disappear. Scientifically speaking political factors do not come into the question. Any scientific gold exchange standard would be theoretically all right. But you see people have lost all confidence in that. As a concession to public opinion and to put a stop to all controversies I want gold standard. It will mean less management by the Government. I do admit that no management at all, is not possible, but I want less management by Government.

7472. Should I be doing justice to your opinion, as between the gold standard and the gold exchange standard, if I were to say, in view of your last answer, that you prefer the gold standard not perhaps because it is scientifically more automatic than the gold exchange standard but because people think it is?—In one sense I would say yes. If you can trust the authorities which control this gold exchange standard. it is all right; but there is always this danger, that they are not infallible; our currency experts are not infallible. If there are no blunders like the reverse council muddle of 1920 then of course it may be all right.

7473. With regard to this question of manipulation, what effect would it have upon your opinion as to the relative advantages of the two standards if the control of the currency and the currency reserves under a gold exchange standard were transferred from the Government to a Central Bank?—That depends upon the nature of the Central Bank. If the Bank has the confidence of the public then it will be all right.

7474. What are the essential conditions in the constitution of a Central Bank in order to secure this necessary confidence? That is the very last phrase of your memorandum, in which you say that ultimately the work of Government in connection with the exchange and note issue should be transferred to the Imperial Bank but after imposing special conditions on the Bank to safeguard the interests of the Government and the Indian public?—Yes, the difficulty is you must understand the psychology of the Indian public. They of course do not like State management, but management by the Imperial Bank they would not prefer, as the Imperial Bank now stands. You know there is the opinion, rightly or wrongly; only the other day there was a note appended by Mr. T. C. Goswami to the External Capital Committee's Report which says there are racial distinctions made by the Imperial Bank. I do not say that it is true, but there is the feeling and I know that this note was quoted all over the country and perhaps it attracted more attention than the Report of the External Capital Committee itself. So long as the feeling is there, if we change this management from the State to the hands of the Imperial Bank I do not think that will be a real solution of the Indian currency problem.

7475. Interesting as it is to learn the opinions of the uninstructed public, we are concerned here with a region in which more illumination may be expected, and we have to inquire, have we not, whether a standard may be made satisfactory if it is entrusted to a properly constituted bank?—You mean the gold exchange standard?

7476. Yes. What are the essential features in the constitution of the Bank in order to make it satisfactory that it should be in charge of such a standard? It occurred to me that possibly you might have given some consideration to that problem?—The public may be uninstructed; but we cannot ignore public opinion in these things; after all you have to do not with a small section of the intelligent public, but with the public as a whole, whose confidence must be secured, and I think no kind of gold exchange standard will satisfy public opinion. That is my idea. The gold standard may not be the best, and it may be more costly; but that cost has to be incurred in order to remove public suspicion; I have said in my memorandum, as a sort of insurance premium against blunders by the currency experts. Just as in ordinary insurance you have to go on paying the premium though there is no outbreak of fire every day; this is something like that. I know it is more costly, but that is my standpoint.

7477. You will not suppose that my questions imply an argument in favour of one standard or the other; I am proceeding only upon your own reply, that the gold exchange standard would be satisfactory if it were in the hands of a properly constituted Central Bank; and I am seeking to ascertain what, in your opinion, were the essential features in the constitution of the Central Bank in order that it might be made a satisfactory repository for the control of such a standard of currency?—As regards this matter I think it is one which requires to be threshed out by an expert committee on banking. I cannot say whether this charge of racial discrimination is true or false; it is difficult to give an offhand answer to that question as to what would satisfy public opinion. Personally I dislike managed currency as more liable to error and abuse and I think it is better to have a gold standard.

7478. We must in the last resort, must we not, as between ourselves transfer responsibility to some

expert opinion other than ourselves. That is what we are here to consider, are we not?—With regard to banking, what will actually satisfy the public I cannot say; I have not the facts at my disposal.

7479. I am feeling a real difficulty, because you told me that, as between the two standards, the gold standard and the gold exchange standard, the question as to whether one or the other is to be preferred depends in your mind upon whether a Central Bank is properly constituted or not. That seems to imply that it is absolutely essential that we should consider what is the proper constitution for the Central Bank?—With regard to the gold exchange standard alone there is this difficulty; that even if it is in the hands of a Central Bank I do not know whether it will satisfy the public altogether.

7480. Let us leave that difficulty for future solution. In paragraph 11 you refer to the rate of exchange between the rupee and gold; and you say "In selecting the proper rate we should look not to the special interest either of the importers or of the exporters or of a particular industry or industries." You then express the interesting opinion that if any industry has to be assisted the proper method of doing so would be by bounty or protection, or both, and not by manipulation in the exchange rate?—Yes.

7481. I understand that you deprecate management of the exchange rate as a method of benefiting Indian industries?—Yes, certainly.

7482. You say in the next paragraph: "There is something to be said in favour of the present 1s. 6d. rate, but I doubt whether this rate will continue for long." Can you amplify that a little by telling us what assumptions and forecasts give rise to your doubt as to whether this rate will continue?—I have explained that in the next few lines—"the rise in the gold value of the rupee during the last nineteen months is about 20 per cent." It really depends upon the European demand for our products and our demand for European products. I know that owing to the post-war economic reconstruction the European demand for our products is pretty keen and so we need not go back to the 1s. 4d. rate, we have been enjoying good harvests for the past four or five years; suppose there is a famine in the near future, will it be then possible to maintain this 1s. 6d. rate? The mere fact that we are going to adopt the gold standard will have some effect on the value of gold also and the rate may come down at once.

7483. Perhaps you would explain why these changes in the demands to which you refer, after the adjustment of prices to any given rate, such as the 18d. rate, would make it more difficult to maintain one rate rather than another?—We should know why this high rate has come into existence, why the rate has improved from 1s. 4d. to 1s. 6d. I think it is due to the increased demand for our products in Europe. But can we count upon increased demand at that rate for ever, or say during the transition period?

7484. I do not quite follow how what you mean by increased demand affects this question. Can the foreign trade of any country continue to show a balance upon the one side of exports or the other side of imports for more than a very limited period?—That is true; but I mean to say that what fixes the external value of the rupee is the foreigner's demand for our goods; if that demand is very keen, the external value of the rupee is rather high; in that way I have looked at this problem. Suppose there is, on the other hand, a famine in the country and prices rise, then the foreign demand at once drops and the external value of the rupee will go down.

7485. Sooner or later, over any reasonable period of time, what the country exports in reply to a foreign demand must be balanced by some form of import?—That is ultimately true.

7486. If it is not, then there will be such changes in the price level as will need adjustment?—Yes.

7487. If that is so, from what we know as the ordinary economic analysis, why is the present rate of 18d. harder to maintain than a lower rate, or the lower rate easier to maintain that 18d.?—I think there are two opposing kinds of forces, some try to push exchange up, others try to push it down, and I think we should take 1s. 5d. as the resultant of these two sets of forces. I think that is a more normal rate under the circumstances.

7488. Let us examine what is meant by the normality of the rate. What is a normal rate and what is an abnormal rate? What I would suggest, according to current ideas, is that a normal rate is one at which the internal prices of the country have adjusted themselves to world prices?—You mean the purchasing power parity?

7489. I mean, if I may say so, nothing of the sort at all. Is there any level in rates which can be said to be normal or abnormal except that rate to which the internal prices of the country have adjusted themselves and are in equipoise with world prices?—Yes, that is the normal rate.

7490. If we take two extreme cases to illustrate our discussion, of a rate of 2s. and a rate of 1s., is it your opinion that, if we assume that in the one case prices have adjusted themselves to the 2s. rate and in the other case prices have adjusted themselves to the 1s. rate, one of those rates is absolutely easier to maintain than the other, and, if so, why?—I hope, there is, in the illustration you take, no control of exchange or selling of councils or sterling purchases of any kind.

7491. I am assuming that the currency system of the country is free from any management, whether it be a gold standard, or a gold exchange standard. What I want to know is whether it is easier in your opinion to maintain one rate or the other, if we assume that in either of the cases prices have once adjusted themselves to that rate?—If the prices have adjusted, I think it is immaterial. But suppose there is a famine in the country and the price level rises. During the last few years we had good monsoons and good harvest; we cannot expect that it will continue for ever.

7492. Supposing we take it that there are bad monsoons and famine conditions, and we assume that prices have adjusted themselves to the 2s. rate in the one case and to the 1s. rate in the other, is it in your opinion harder to maintain the rate in the one case than in the other, and, if so, under which conditions, and, if so, as I have said in one of these numerous queries, why?—With regard to this my contention is that prices have not adjusted themselves to 1s. 6d.

7493. We are making the assumption, for the purposes of our little discussion, that prices have adjusted themselves to either of those two rates. I will ask you a further question afterwards?—If we assume that the prices have adjusted themselves to this rate, one or the other, and if world prices and Indian prices are in equilibrium?

7494. In that case?—Even then I think they would adjust themselves to the rate I have recommended for the transition period.

7495. If you would rather not express an opinion without further reflection, I do not want to hurry you into an opinion which you have not considered?—Yes, that is an academic matter which I have not considered. I cannot give an opinion offhand on an hypothetical question.

7496. That is a question to which you would like to give further consideration. Now you say that, in spite of this fact, there is no immediate possibility of exchange going down to 1s. 4d. You do not look upon that is a natural consequence to foresee?—Well, practically, as I have already said, Europe's demand for produce will remain keen for some years to come. That is what I have suggested.

7497. Then you say that you would advocate 1s. 5d. during the period of transition from our present system to the gold standard, which will mean far less inflation of the currency that in the case of a 1s. 4d. rupee?—Yes.

7498. Then you say that it could be more easily maintained than the present 1s. 6d. rate, which does seem to argue the formation of an opinion upon that question on which you have preferred to reserve your opinion?—Because what I thought is this. Whatever may be the opinion on the hypothetical question, how much price can you demand from foreigners if we keep the exchange rate very high?

7499. Let us leave that, because I understand you have reserved your opinion upon that. You say it will mean far less inflation of the currency in the case of a 1s. 4d. rupee. Shall I be right in assuming from that that there will be some inflation?—Yes, but not much, as I have explained in the next paragraph because we have to go only from 1s. 6d. to 1s. 5d.

7500. What will be the consequences of the measure of inflation involved?—Of course that depends on the degree of inflation.

7501. It is the degree of inflation involved in reducing the rate from 1s. 6d. to 1s. 5d.?—The consequence of inflation are quite patent.

7502. It means rising prices?—Yes, in India.

7503. It means all the normal consequences of inflation in the proportions involved?—Yes.

7504. Might not a critic of your proposal put this to you, and say that inflation is usually looked upon as involving consequences that are not beneficial. Do you agree to that proposition or not?—As between inflation and deflation I think inflation less harmful. Of course, I would rather have stabilisation of prices. Stable prices is much better than either of the two. But as between them I think inflation is much less of an evil than deflation.

7505. This critic to whom I was referring would seize upon the first part of your reply and say that, as between stabilisation and inflation, he would prefer stabilisation?—Yes.

7506. He would say to you: "Why, if that be so, and for what advantages, do you recommend a step, that is the reduction to 1s. 5d., which would involve some of the evils"?—My idea is that it will be more easily maintained. 1s. 6d. is rather too high a rate. I believe it may be possible to maintain even the two shillings rate—it may be possible by a larger deflation of currency. But would that be desirable? Would 1s. 6d. be a safe rate?

7507. Should I not be right now, after our discussion has reached this point, in saying that you proceed upon the assumption that the 1s. 5d. rate is more easily maintained than the 1s. 6d. and that, as you tell me, involves a proposition as to which on the whole you would prefer to reserve your judgment, that one rate is more easily maintainable than another?—But as I have said I mean that this 1s. 6d. rate has not been determined out of the equilibrium of Indian prices with world prices and hence more difficult to maintain.

7508. Then that opinion is based upon a further opinion that Indian prices are not adjusted to the 1s. 6d. rate, to the current rate?—Yes.

7509. That is an important head of inquiry. Can you assist the Commission by any amplification of your opinion as to whether or not current Indian prices are adjusted to the current exchange rate?—Of course, they are not. That is my whole point. It is patent, if you look at the index number of prices, for India and other countries. I have got here some figures from this monthly bulletin of the Economist.

7510. What prices are you referring to there?—Those of the monthly bulletin of the League of Nations published as a monthly supplement by the Economist.

7511. It is the Economist index number?—Not the Economist, but the League of Nations bulletin as summarised in the Economist every month.

7512. The League of Nations Bulletin gives certain summaries of index numbers. What index number does the League of Nations give?—It gives the United Kingdom Board of Trade Index Number and the Calcutta Index Number, beginning from 31st July, 1914, and there are also other countries. And if you will take the index numbers that does not show that the exchange ought to go up to 1s. 6d.

7513. This gives the United Kingdom Board of Trade Index Number, that is for wholesale prices, I imagine, and the Calcutta Index Number also for wholesale prices. Are these the two prices to which you are referring?—And there are other countries also, Germany and many other countries.

7514. It is a little difficult to follow because we are not told exactly what the figures are. We are now looking at this, are we not, to see whether Indian prices are, on the whole, in adjustment with prices elsewhere?—The Indian prices have gone down lower than English prices, from 181 in October, 1924.

7515. The rate of exchange has been rising, of course, since then. That is what you would expect, would you not?—Yes, but is the fall in prices proportionate to the rise in the rate of exchange?

7516. The last two figures that we see here in your figures are the United Kingdom Board of Trade Index Number for wholesale prices in September of this year, which is 156, and the Calcutta Index Number for September of this year, which is 158?—Yes. If you look at the purchasing powers of different currencies alone, if there are no other factors, and if the rate of exchange is calculated from the Index Numbers, it will be somewhere near 1s. 4d.

7517. I wish you would explain to me how you calculate that theoretical rate of exchange from the index numbers of 156 and 158. Do these not show a substantial adjustment, within the margin of error, for the calculation of such indices?—Well, the index number representing English prices divided by the index number representing Indian prices multiplied by the rate of exchange in the base year, would be about 1s. 4d. So I think this 1s. 6d. is rather high. I am working on the doctrine of the purchasing power parity, according to which the index number representing prices in one country, say England, divided by the index number representing prices in a second country, say India, multiplied by the rate of exchange in the base year gives the purchasing power parity to which the exchange rates should approximate. Of course that does not tell us much definitely because after all there are many forces deflecting the rate of exchange from this purchasing parity. But I mean it shows that 1s. 6d. is rather too high. As I have said in my memorandum the increase in the value of the rupee is 20 per cent. during the last 19 months. That is rather too high; that is what appears to me.

7518. What are the special circumstances justifying this high rate?—I have already stated them. In fact, there are two sets of forces, and I think I would have the golden mean of the two. That is what I have suggested.

7519. I wonder if you will repeat, so that I may try and follow it, the calculation which you have just made to show that the prices are not adjusted at the present rate?—I am referring to the doctrine of the purchasing power parity, namely, that the index number representing English prices divided by the index number representing Indian prices, multiplied by 1s. 4d., the exchange rate in the base year, is the basis parity. I took the figures from the Board of Trade. If you will take the Economist index number, it will be different, but it will be much less than 1s. 6d.

7520. Continuing with your recommendations, you recommend the striking of a new coin called the gold Mohur—this is in paragraph 15—and the fixing of a convenient ratio between the new gold coin and your adopted ratio of 1s. 5d.?—Yes.

7521. Then you enter into a calculation as to the amount of gold that would be necessary for the introduction of your proposals, and you arrive at the conclusion that they will require 175 crores worth of

gold?—Yes, that is additional to India's present supply.

7522. I think that concludes the substance of your positive recommendations?—Yes.

7523. (*Chairman.*) Will you now be so kind as to answer any supplementary questions which my colleagues may have to ask you in connection with these things.

7524. (*Professor Coyajee.*) Professor Sinha, you quote an opinion of Dr. Cannan to this effect:—As Professor Cannan rightly observes, "the single advantage offered to a country by the adoption of the gold exchange standard system, instead of the simple gold standard is that it is cheaper, in the sense of requiring a less value in the shape of metallic currency than the gold standard. But all that can be saved in this way is a trifling amount almost infinitesimal beside the advantage of having a currency more difficult for administrators and legislators to tamper with." Now Dr. Cannan takes only one item of the costs, namely, that a certain amount of gold currency will have to be introduced, but he does not take some other items additional to that—the second item would be the depreciation of the whole amount of silver in the hands of the country whether as ornaments or as coin, because that will have to be sold?—You mean the depreciation in the value of ornaments or silver hoards?

7525. Yes?—Then that is a factor. But if we spread our sale gradually, I think this loss would be minimised. Of course that is a factor which we cannot get over completely.

7526. I mean, the amount of silver ornaments in the country must be very large. Silver is in the hands of many as ornaments?—When silver is demonetized, of course, that is a factor. You mean there will be a further fall in the value?

7527. Yes, when it is known in the silver market about India, which is one of the mainstays?—But that depends on the amount of silver that is at once thrown into the world's bullion market from India. There is that psychological factor in the first place. But the question is whether that will be permanent. Of course, it must be depreciated to some extent, I admit.

7528. Perhaps the biggest purchaser of silver will then be out of the market?—That is so.

7529. Then is not there a third item?—But so far as that is concerned, I may say that if you spread the sale over a number of years, I think that this loss would be lower.

7530. You spread the sale of the bullion and the coin, but the ornaments will be permanently depreciated, or, if exported, they will not be exported in that very discreet way which you suggest?—As soon as India adopts a gold standard, there will be a fall in the value of silver and a rise in the value of gold, but the question is whether that will be permanent, whether that fall will continue for ever, unless we at once throw a large amount of silver on to the world's markets.

7531. You mean the conditions of the production of silver might adapt themselves so that less is produced?—Yes, and if you spread the sale over a number of years.

7532. Now is not there a third item? It has been suggested like this: the contention has been put in this way, that if you utilize India's favourable balance of trade to get more gold for currency, then *pro tanto* it must restrict her imports of industrial equipment for her industrial progress. Is not that true? We cannot use the more favourable balance to get two things, gold and the other things?—But what do we at present do in respect of importing a large amount of gold?

7533. That is true, but that might be added, because there are social uses of gold and you superadd to them the currency factors?—But we are importing silver also; of course, that will be less.

7534. Then as regards your base year, from this you calculate the purchasing power basis of parity; and will you show us whether your calculation tallies more with 1s. 5d. or more with 1s. 4d. or 1s. 6d.—if you could do it on the spot, it would greatly assist the Commission?—I have not got all the figures.

7535. But what is the base period which you are taking?—If you take, say, 1913. But I say we should not put much faith in that alone because there are other factors.

7536. So it is not conclusive by itself?—That calculation would not be conclusive; all that I mean to say is that 1s. 6d. rate is rather too high.

7537. (*Sir Purshotamdas Thakurdas.*) I have to ask a question, Mr. Sinha, about the loan offices which you say are run by pleaders. You say that in every district in Bengal there are some banks, but that what they do is to lend money to the zamindars on the mortgage of their property. Who runs them?—Mostly the pleaders of the district courts.

7538. Will you tell us what sort of capital they command?—They attract deposits from the public, and they lend this money generally to the zamindars of Bengal. Most of them do this.

7539. They simply do the business of lending on mortgages of landed property?—Yes, that is their main item of business.

7540. If they attract deposits from the public, are they limited companies? Can you give us the name of one of these? What do they call their institution?—Yes, they are limited companies; one of them, for example, is the Pabna Bank. Such a Bank does not do genuine banking business.

7541. Are there many of these small Banks in Bengal?—In almost every district there is one.

7542. And they are run by pleaders only?—There are outsiders also, but pleaders generally run the show.

7543. What sort of dividend do they pay?—Sometimes a good dividend—10 to 12 per cent.

7544. Then what sort of deposit interest do they pay to depositors in order to attract deposits?—Much higher than the interest given by, say, the Savings and other Banks. I cannot give exact figures, as I have not studied the subject in detail. But what I say is that these banks may be converted into real banks.

7545. (*Sir Reginald Mant.*) Mr. Sinha, you have estimated the cost of introducing a gold currency at about Rs. 1 lakh per annum?—That is so far as the wear and tear of gold coins is concerned. If we substitute gold coins for silver, that means some extra cost, in wear and tear, and that cost, as I calculate, won't exceed one lakh of rupees.

7546. Then you would also take into account the cost of acquiring 110 crores worth of gold?—I have considered the matter in my memorandum later on. That is additional, but that is not a recurring factor. So long as gold coins circulate, the one lakh, however, will be more or less a recurring factor, unless you can replace gold coins by gold notes.

7547. Then you might call it a capital charge?—Yes, unless we can have more of gold notes in place of these gold coins—which would be our ideal.

7548. But a capital charge represents an annual interest charge, does it not, the interest charge on the cost of acquiring 110 crores worth of gold?—Yes. Of course, I do not pretend that we can have gold standard without having to bear the cost.

7549. In paragraph 10 of your memorandum, in discussing the effect on world prices of India adopting a gold standard, you quote the opinion of Sir James Wilson that the world's available supply of gold is now increasing faster than the world's effective demand, and you conclude that it is thus to the economic interest of Western nations that India should adopt a gold standard with gold currency. Then two paragraphs later. In discussing the possibility of maintaining the 1s. 6d. ratio, you doubt whether the ratio would continue long, because you anticipate that with the increased production of commodities in Europe the general price level may fall. How do you reconcile those two arguments? In the one case you argue that there is a risk of a redundancy of gold, and in the other you argue that you anticipate a

scarcity of gold. How do you reconcile the two arguments?—Both forces are there, but they do not operate to the same extent, and at the same point of time. In the opinion of Sir James Wilson and Dr. Gregory, there will be a surplus of gold for the East if Europe wants to maintain the present level of prices.

7550. You accept that opinion when you argue in favour of a gold standard and you reject it when you argue against the rate of 1s. 6d. Is that your position? I am trying to reconcile your two arguments?—Both forces are there. It will be the resultant of both the forces. There is this tendency of the excess output of gold and on the other hand there is this danger of increased production. The former is immediate, the latter remote.

7551. *(Sir Maneckji Dadabhoy.)* Mr. Sinha, like my colleague, Sir Reginald Mant, I also feel a little bit embarrassed by your reasoning in regard to the question of the ratio which you gave in answer to the Chairman's question. In paragraph 11 you have made your position perfectly clear. You have given us as your considered opinion that "in selecting the rato we should look not to the special interest either of the importers or exporters of or a particular industry or industries. The rate should be so selected that it can be easily maintained." The sole test of the ratio according to your opinion should be its maintainability. On the other hand, when discussing the question of the high rate, in answer to the Chairman, you said, I have taken down almost your words and you might correct me if I am wrong, that "the high rate has come into existence. It is due to increased demand for our products in foreign countries. It is the foreigners' demand for our goods that increases the external value of the rupee." How do you reconcile these two statements? At one place you argue that the test is maintainability and that you should not look to the special interests, either of the importers or exporters?—I do not mean that it is not affected. What I meant was that we should not be looking to these interests only. That is, a low rate may be favourable to exporters, but we should not advocate it merely because it is favourable to the exporters. We should not, on the other hand, advocate a high rate because it favours the importers.

7552. But that high rate, according to you, is brought about by other factors and by external value of the rupee as controlled by the export of our products?—Yes.

7553. Then the ratio is to a certain extent also influenced by these external considerations?—The ratio is certainly influenced by external considerations. I do not see any inconsistency there.

7554. Then you have given your opinion that there is no immediate possibility of exchange going down to 1s. 4d. Is it not a little bit too dogmatic an opinion? I will put it the other way. Would you have said 16 months ago the same? Would you have used the same language and said there was no immediate possibility of the exchange going up to 1s. 6d.?—I have formed that opinion from the demand for the Indian products abroad. Just after the economic readjustment in Europe the demand for our products remains there, and so long as it remains so, we must have a higher rate than this 1s. 4d.; but whether we should be able to keep to 1s. 6d. after the demand grows less keen, as it must, is another question.

7555. May I gather, then, that this increase in the ratio has been due to a large demand for our goods?—Yes.

7556. Have you got any information for that statement? Any figures to show that?—If you look at our export trade you will find it.

7557. Of course, there is always the balance. But as compared with the previous years, has there been during the last 16 months a comparatively large volume of exports? Are you in a position to say that?—If you look at the prices of our exportable products, you will find it. Sir Basil Blackett, in his last Financial Statement, said that, in spite of the high exchange, the prices of these products were high. That shows the foreign demand.

7558. You know very well that had it not been for certain manipulations, probably the exchange would have gone up to 1s. 8d.?—Yes.

7559. And it is only on account of the timely saving that exchange has been kept up at 1s. 6d.? How do you account for that, then?—But can it go on for the next five years? Suppose there is a famine, will there not be a rise in prices, and will it not be difficult to maintain this 1s. 6d.?

7560. Can you specifically enumerate the special circumstances justifying the present high rate of 1s. 6d.?—You mean which have brought about this rate?

7561. Yes; can you enumerate the circumstances justifying this rate?—I cannot give any definite figures; but I think it is the foreign demand which is really responsible.

7562. Finally, I understand that the ratio, which you recommend, of 1s. 5d. is to be only provisionally fixed during the period of transition. Is that your idea?—Yes.

7563. It is not permanent?—Yes; because if we have gold standard, pure and simple, then the rate is immaterial.

7564. It will automatically adjust itself?—Yes.

7565. So this is only a provisional recommendation?—Yes.

7566. *(Sir Rajendranath Mookerjee.)* Let me ask you this, as a preliminary question; What do you estimate the population of India to be?—330 millions or something like that.

7567. What percentage of that population are so poor as not to be able to hoard silver to any large extent, according to your estimate?—70 per cent.

7568. How much do you think is the average amount they may hoard, I mean each individual?—Among the 70 per cent.?

7569. Yes?—I have no experience about that.

7570. You can give an average figure; you have experience of the village life in Bengal?—So far as Bengal is concerned, the peasants do not hold much. I have not come across anyone who holds any rupees.

7571. Would you say Rs. 20 each man as an average?—I doubt even that. So far as the villagers are concerned, they are very poor. Unless there is a surplus how can they hoard anything?

7572. You may give us the figure you consider as approximately correct?—I don't think any mere guesswork will solve the problem. Because I do not believe that all of them do hoard something.

7573. Take the average figure. Some may hoard and some may not. Can you not give us an average figure? I give you 20; you may give another figure.—20, I doubt.

7574. 15 rupees?—That means every year they will have a surplus of Rs. 15.

7575. You tell me what the figure is according to your estimate, not what it means.—My idea is that it is impossible to estimate. This cannot be calculated.

7576. Rs. 10?—Rs. 10 on an average?

7577. Yes.—No, otherwise how can you explain the indebtedness of the peasantry?

7578. You know the village life very well and yet you are unable to give us a figure.—So far as my native village is concerned, the people there are very poor and I don't think they save anything.

7579. They save nothing?—Some may save. But I cannot say whether the average will mean anything.

7580. The official estimate for hoarding is 150 crores. Then who holds this large sum? Some must hoard, at any rate?—You mean these 150 crores?

7581. Taking any hypothetical figure? Assuming that is the figure?—150 crores on an average, but in what year?

7582. *(Chairman.)* 150 crores held in hoards.

7583. *(Sir Rajendranath Mookerjee.)* Yes, I am not talking of years?—I have no experience of the peasants outside Bengal.

7584. Assuming that figure as hypothetical? The habit of classes which are supposed to hoard is generally to keep silver coins or as ornaments. Most

people in India, those who can save anything, have silver ornaments. Can you estimate how much silver they consume in these ornaments?—I have not tried to form an estimate.

7585. Perhaps you will be able to do so if I tell you why I ask you this question. I am trying to find out what is the actual hoarding in India. My object is to be able to arrive at an estimate of how much hoarding in India there is, and what part of it will tend to be exchanged for gold when gold currency is introduced, what the poorer class is holding and what the richer class is holding, the form of hoards, and after deducting what the average holding for ornaments is, to find what actual coin there is, we will then be able to find out what will be the amount which will be tendered for exchange into gold.—It cannot be much, but I am sorry I cannot give any definite figure. I am not competent to give these figures. After all, it will be a mere guesswork.

7586. (*Chairman.*) With regard to the questions I asked you about the index number, you remember I was referring to the figure to which the Calcutta index number shows an adjustment of prices to the current rate of exchange. I want to be perfectly certain that I have done full justice to your evidence under that head. Shall I be putting your argument correctly if I put it in this way, that, allowing for the rise in exchange, it is necessary to raise the Indian index number by about an eighth, 12 per cent.?—You mean a rise in the exchange?

7587. Yes?—Then it will reduce our index, for, it is the index representing English prices divided by the present rate of exchange and multiplied by the rate of exchange in the base period. So if you want to raise it to 1s. 6d. then the Indian prices index number will be lower.

7588. I am not sure that we are not looking at it from two different points of view. If I may just follow it out in this way to cover your argument, allowing for the variation in exchange it is necessary to raise the Indian index by one-eighth to find the comparative gold price index for India corresponding with the British figure, and the Indian figure of 157 would then become 177 as compared with the British figure of 158?—No, the index figure representing English prices was 156, for September and the index figure representing Indian prices was 158, for the same month. To adjust the Indian index to the present rate of exchange, you multiply the English index by the rate of exchange for the base period and divide the product by the present rate of exchange—that is my calculation. So if you want to raise the rate of exchange above 1s. 4d. this 158 must be much smaller. Indian prices must go down if you raise the exchange above 1s. 4d.

7589. Is your argument that the present exchange is higher or lower than the price parity you want?—Higher than the price parity.

7590. So that, in order to put the Indian figure in the same category for reference, in view of the rise in exchange, we ought to raise it from 157 to 177?—No.

7591. And that suggests to your mind that the present level of Indian prices is too high?—No, the present level of Indian prices, if you take 1s. 4d. rate, is not too high; but unless you raise the Indian price level higher you cannot bring the exchange rate down.

7592. It is really two aspects of the same thing. There is only one supplementary question that I should like to ask and that is this. In expressing that opinion have you taken into consideration that allowance must be made for the heavy general tax which is now in force in India?—No, for, as I have already said, the purchasing power parity indicates only a tendency, that is not conclusive by itself.

7593. But you would agree that, if we are going to consider whether these prices show adjustment or not, we must take into consideration the counter-balancing effect of the tariff in raising the prices of imports into India?—Yes, and the freights.

7594. Further, in order to follow this out, have you considered that there is at present a striking disparity between the index numbers for Indian export and import articles, which, since last July, have stood at such widely different figures as 142 and 199 respectively?—Tariffs have been since then rather too high.

7595. You will see the bearing of my question if I put the final question. If you consider the export index of 142 only and not the import index figure, which is affected by the tariff, then if you make the allowance of 12 per cent. on 142 you do get a figure which is very closely in correspondence with the British index of 158?—Yes.

7596. Would you agree that these are material considerations in working out the evidence of the index number, for what it is worth, as regards the adjustment of prices?—If you mean export prices;—yes.

7597. You have followed me, have you not, in these figures?—Will you kindly repeat your question?

7598. The index for July for goods exported from India which are not affected by the tariff is 142. If you add 12 per cent. to that you get about 158, do you not, or 157, and that is in very close correspondence with the British index of 158 for the same period?—Yes, but why should you take the British general index number and for India the export index number?

7599. Because your import figures are affected by the tariff?—But in England also though this is a minor consideration the figures are to some extent affected by the tariff.

7600. Surely, but that appears in the British index. At any rate, we are not in disagreement that these have to be taken into consideration in analysing the evidence of the index number?—Yes, we have to take it on both sides.

7601. (*Chairman.*) You have to take it on both sides, if there are export duties corresponding to the import duties; but I think we now have the benefit of understanding the bearing of your argument. Mr. Sinha, we are very much obliged to you for your very full assistance to-day and for your memorandum.

(*The witness withdrew.*)

TWENTIETH DAY.

Wednesday, December 23rd, 1925.

PRESENT:

The Right Hon. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Maneckji Byramji Dadabhoy, K.C.I.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.

Mr. G. H. Baxter, Mr. A. Ayangar, (*Secretaries*).

Mr. Kenneth Campbell and Mr. F. V. Rushforth, representing the Bengal Chamber of Commerce, called and examined.

7602. (*Chairman*.) Mr. Campbell, you are President of the Bengal Chamber of Commerce and a member of the Bengal Legislative Council?—Yes.

7603. And you have with you Mr. Rushforth, who is also a member of the Bengal Chamber of Commerce, in order to represent the views of the Chamber?—Yes.

7604. These views have been set out for us in a very full memorandum,* so that we understand you will be expressing here to-day opinions on behalf of the Chamber and not personally?—The views expressed are the views of the Committee; if you take me outside that, I may not know the views of the Committee of the Chamber and therefore they may be my own views.

7605. Anything further than this memorandum would be your personal view and not the view of the Chamber?—Not necessarily the view of the Chamber.

7606. Will you tell us what is the number of firms who are members of the Chamber of Commerce?—We have firms members, company members and one or two individual members; I think the total number is about 250.

7607. Could you give us a general account of the nature of the business interests which are represented by the Chamber?—They practically include every business that exists in Bengal jute mills——

7608. That is manufacturers?—Yes; and exporters of manufactured jute goods, bankers, brokers, the Port Commissioners, the Railways such as the Eastern Bengal Railway, the East Indian Railway and the Bengal-Nagpur Railway.

7609. We may take it, then, that the Chamber is thoroughly representative of all forms of commercial and business interests in the city of Calcutta?—I should say so certainly; you might add tea to the list.

7610. You mention, in addition, the interests of those concerned in the tea trade?—Yes; and hides and skins and engineering.

7611. So that we have represented in your Chamber both sides of the picture, both the exporter and the importer?—Yes, certainly.

7612. I will, if I may, just ask a few questions in order that you may elucidate some of the leading points in the memorandum of the Chamber. The memorandum, if I may say so, is so full that it will probably not be necessary for me to do anything more than ask questions on points which may seem to require some explanation. Turning, in the first place, to the 3rd paragraph under question 1 (*a*), you are dealing there with the present situation, and the opinion expressed there is that, although you deem it to be of the highest importance that an attempt should be made at the earliest opportunity to solve the currency problem, you do not feel that the present is an ideal time, but that nevertheless if we arrive at the conclusion that stabilisation is feasible the Committee of the Chamber would support remedial action. You then refer to some of the disadvantages of the present situation, amongst others to the uncertainty produced by the possibility of the Government increasing or decreasing their purchases of sterling. As a question of policy, do you consider it desirable, in any future organisation of matters in this respect, that there should be a separation in principle between those exchange operations undertaken by the currency authority for the stabilisation of exchange, such as the buying and selling of international currency at the gold points, and the business of Government remittance to meet the home charges?—I do not think it is necessary to keep them entirely separate; to a certain extent the one may help the other.

7613. The contention that has been put before us is that, in some degree, it has never been fully recognised that the business of stabilisation of the exchange rate should be looked upon as one thing and the business of Government remittance should be looked upon as another thing, and there has been a confusion between the two, leading to a loss of efficiency in both. Have you any opinion to express upon that in this connection?—We have got no complaint as regards the manner in which it has been dealt with in the past. We think they must be dealt with to a great extent together. The mere fact that Government are remitting for purchases must have a bearing on exchange.

7614. Undoubtedly the very large remittances that have to be made by Government must always constitute a very important factor in the exchange market?—Certainly.

7615. Let me put a question to you, in order to elucidate your opinion, in the form of some hypothetical changes. Supposing that a transfer of the control of the note issue and the currency in general were to be made to a central bank, that bank accepting the obligation to buy and sell some form of international currency at whatever are the upper and lower gold points in relation to the established rate; and supposing that the central bank in question were also to be charged with the business of supplying the Government with the means of remitting their home charges, would that, in your opinion or would it not, be an improvement in comparison with past methods in this connection, that is the uncertainty introduced by the possibility of Government increasing or decreasing their purchases of sterling and thus affecting the rate of exchange?—I take it, Sir, that before it was handed over to the central banking authority the rupee would be stablised.

7616. Some rate would be adopted for stabilisation?—If one gets stabilisation and Government have to buy and sell at the upper and lower gold points, it rather gets over our difficulty of not knowing when Government will operate.

* Appendix No. 37.

7617. In the next paragraph you refer to the absence of facilities for an automatic regulation of the volume of currency. That I will leave for the present because we can discuss it more closely a little later on. In the paragraph after that you refer to the circumstance that if there were again to be a divergence, that is, between sterling and gold, the present fixation in terms of gold would result in further fluctuations in terms of sterling. I refer to this as another point in your memorandum upon which I will ask a question a little later on. Now I come to the last paragraph but one under this head, where you say: "Further with regard to internal conditions the Committee would point out that India has experienced four good monsoons in succession and it is not unreasonable to anticipate a bad monsoon or more than one in the near future. They are not convinced that in such an event the resources of the Government would be sufficient to maintain exchange at its present level without undue disturbance to the money market, and an unsuccessful attempt to support the rupee would have incalculable effects." Now as to that, are you of opinion that the success in maintaining whatever level is accepted would depend chiefly upon two things, first of all, upon the circumstance whether or not internal prices in India had adjusted themselves to the level which it is sought to maintain, and, secondly, whether the size of the reserves maintained for the protection of exchange was adequate? Are those the two things to which we must look when we are considering whether any particular rate can be maintained against the pressure of one or more bad monsoons?—I think that covers it, as long as Government can use the reserves to the extent that is necessary, that is, the home reserves, and at the same time they do contract the currency in India against everything that is issued out of the home reserves.

7618. As you very rightly add, you must consider not only whether the reserves are big enough but whether they are properly used?—Certainly.

7619. Have you an opinion upon this question. Take any rate that may be chosen. Supposing that internal prices have adjusted themselves to that rate and supposing that the size of the reserves is adequate and that they are properly used, would there be any greater difficulty in maintaining one rate rather than another in the face of such adverse circumstances as the two bad years? If that is rather a theoretical question with which you would prefer not to deal, do not let me press you upon it, Mr. Campbell?—(*Mr. Rushforth.*) May I answer that, Sir? It seems to me that it is not only a question of the size of the reserves or whether one uses them properly but whether one can as a practical proposition use them properly. The experience in 1920 in the falling market when they were endeavouring to utilise those reserves was that they could not; it was not a practical proposition to contract the currency in order to make the mechanism of exchange work as it should do in theory. If you are controlling internal prices by means of contracting your currency at the ports where sterling exchange originates in the first place, you may, before you have affected your prices sufficiently, create a financial crisis in the trade centres, Bombay and Calcutta, and it seems to me that as these two places are the buffer between your external conditions and your internal conditions Government will always have to consider whether they should work out the theory of contraction of currency to its logical conclusion.

7620. In the case of 1920 to which you refer it was, as you tell us, at any rate the case that the currency was not contracted?—It was to some extent to begin with.

7621. Not to the extent to which the reserve was depleted?—No.

7622. Was that due to the circumstance to which you refer of the danger of creating a crisis in the financial accommodation, or was it due to other external circumstances, such as the very large public expenditure to which the Government of India was then committed?—Speaking from memory, I think it was due to the very large possibility of a financial crisis here. I remember money had at that time gone up to 8 or 9 per cent. at call and I know the banks were very nervous that if the policy was continued there would be a crisis.

7623. You have described the imperfection of the way in which the machinery worked for the support of exchange and the control of currency. To what do you ascribe that? What was the cause of that breakdown in the machinery, leading to the further question, what is the remedy owing to the circumstance that you find you cannot contract the currency to the extent required?—I should say to use a simile that the shock absorbers in Bombay and Calcutta were not sufficient to take the pressure of the sudden drop in foreign prices.

7624. The shock absorbers being what, in that case? —The money markets of Calcutta and Bombay.

7625. The resources of those two money markets could not be mobilised in time; and they were not sufficiently liquid. Is that the difficulty?—I think it was that the sudden withdrawal in a few weeks of many crores of rupees from the money market before stocks could be liquidated was likely to cause a crisis.

7626. Is that a state of affairs which you ascribe at bottom to an imperfection in the then existing currency system, or would you ascribe it to imperfections in the conduct of the banks, the policy pursued by the outside banks, and the general trading community?—I don't think I should call it an imperfection. One would say it was due to the conditions in a country like India where your money markets are highly centralised in Bombay and Calcutta and where operations in those places take a good deal of time to have their effect on prices in general in the country as a whole.

7627. The conditions you describe seem to be rather independent of any system of currency which might be in force?—I should say so, Sir.

7628. The difficulties to which you refer are difficulties which would have to be confronted under any currency system?—I think so.

7629. In the next paragraph you say that "if the Commission are not convinced that Government can make any selected rate permanently effective it would be preferable, the Committee think, that Government should confine their exchange operations to moderating the swing of the exchange pendulum rather than endeavour to bring about equilibrium at a rate which would be unsuitable to Indian conditions." Supposing it to be so, would it not be the case that, even though this view were adopted that the Government should confine their exchange operations to moderating the swing of the exchange pendulum, there would nevertheless have to be some rate present to the minds of those who act on behalf of the Government as, shall we call it, the normal rate. If I may put it in this way—a pendulum swings about some point, does it not, so that, even though you are only moderating the swing of the pendulum, you must be looking at some point in order to reduce the swing of the pendulum to that point?—(*Mr. Campbell.*) Our idea was that they would have such a rate all the time at the back of their minds but that they might alter it. For instance, if the rate was as it is now at 1s. 6d. and they became convinced that exchange must go up perhaps to 1s. 7d., they would not let it swing up to 1s. 8d. or 1s. 9d. If they thought 1s. 7d. was about the rate at which they could stop it without upsetting us locally, they would gradually let it go up to 1s. 7d. and then stop it there; altering rates gradually to 1s. 7d. from 1s. 6d. What we would not like them to do would be to endeavour to keep it at 1s. 6d. when the tendency was upwards all the time, and then suddenly give it up as a bad job and let it go to 1s. 9d. In the same way, if the tendency was downwards, we would not like them to hold it up at 1s. 6d. and then let it go down perhaps with a jump to 1s. 2d.

7630. One might put it in this way, that under any circumstances you must have some rate in your mind, though under the circumstances to which you refer you would prefer that it should be only provisional?—Yes.

7631. Turning to the next question, 1 (*b*), you say that you favour stability of exchange as against comparative stability of internal prices brought about by a fluctuating exchange. Does your Committee base this opinion upon the importance of a stable exchange rate as a basis for the external trade of the country? I think that is really the opinion expressed in the preceding part of the paragraph?—What we want is that as far as possible our prices, through a stable exchange, should follow prices in other countries that are based on gold.

7632. I understand from this paragraph that you lay special emphasis upon the necessity for a stable exchange as a facility for the conduct of the export and import trade of the country?—Certainly.

7633. And I understand that it is your opinion, as expressed in your last answer, Mr. Campbell, that if you stabilise the rupee in relation to gold then Indian internal prices will follow world gold prices?—That we think would be the tendency.

7634. That in your opinion would be the maximum degree of stability in internal prices which it is desirable to seek to maintain?—Certainly.

7635. In paragraph 1 (c), on the rising and falling rupee, you say that " it is a truism that ultimately it is immaterial what level is chosen, as prices and wages will in course of time adjust themselves to whatever rate of exchange may be made effective." Are you aware of any special circumstances in Indian conditions which make that proposition less true for India than it is for other countries?—I don't know that I know sufficiently about other countries to be able to compare the two. But our idea was that the only thing that is not ruled by that is forward contracts for a period of years.

7636. Do such contracts bulk more largely in economic and social conditions in India than they do say in Europe?—I cannot say with authority, but should not think so.

7637. Is there any special class?—Certainly not in our business.

7638. Business methods being here the same as elsewhere, one would hardly expect to find any great difference?—I do not know of any great difference.

7639. Nevertheless in this connection special consideration might have to be given to such settlements although they may not be contracts, such as the land settlements?—I have included them in forward contracts.

7640. Then you say: " It is just as unfair that the reduction of the home charges of the Indian Government should be considered a reason for the enhancement of the value of the rupees as that possible benefits to the agriculturist should be made an excuse for inflating the currency and reducing the value of the rupee." Your third point is: " After a period of fluctuating exchange it is obvious that the fixation at any point cannot be universally equitable, but the object to be aimed at should be to cause as little fresh disturbance as possible." I want to find out what you imply by fresh disturbances. What would be the cause of such fresh disturbances as those which you deprecate?—Our idea is that exchange is now 1s. 6d. and that everything has settled down at that price, and a variation upward or downward will cause a fresh disturbance and alter the relation between debtors and creditors as compared with what it is at the present moment.

7641. Then in the next paragraph your Committee think that " it is desirable that the rupee should have a fixed relation to gold, which is the basis of the currencies of the countries with which India conducts the bulk of her trade." Could you give the Commission the benefit of your opinion as to the relative advantages of a fixed relation to gold and a fixed relation to sterling?—Our idea is that gold and sterling are the same thing, and that they should continue the same thing if we are going to stabilize. If sterling and gold are going to leave each other again, we think the time is not ripe for the stabilization of the rupee, as such a large amount of our business is done in sterling.

7642. I understand the opinion of the Chamber is that stabilization should only be undertaken if we are reasonably convinced that gold and sterling are to remain pegged?—Yes.

7643. If, on the other hand, there is a reasonable apprehension that sterling may be divorced once more from gold, would your recommendation be that there should be a stabilization in relation to gold, or would it be that there should be no stabilization for the present at all?—I think that it ought to wait.

7644. You would not recommend a stabilization in reference to gold if there is a danger of gold and sterling being divorced?—I would not.

7645. I understand that is because of the practical inconvenience which would result to India's external trade in having her standard of currency fixed in relation to some currency other than that in which the bulk of the external trade of India is settled?—Certainly.

7646. I further understand that your Committee is not prepared to express any opinion as to whether it is reasonable or unreasonable to forsee any future divorcement between sterling and gold?—One has read a good many remarks as to whether sterling and gold can remain together. Our idea was that when the Commission get home, a certain amount of time will have elapsed and they will be able to get information in England which we cannot get here, and then should be able to come to an opinion as to whether sterling will remain with gold or whether there is any possibility of it leaving gold. We are not competent to express any opinion now.

7647. Basing, as I understand, its opinion upon what you have told us about the undesirability of a fresh disturbance, your Committee arrive at the conclusion that, if the rupee is to be stabilised, it should be at the rate of 1s. 6d.; and I further gather that the reasons for that are two, in the first place, as you have said, the avoidance of disturbance, amongst which you specify in particular the circumstance that to force the exchange down to 1s. 4d. would involve a rise in prices and thus a higher cost of living for the poorer classes—that is the first reason?—Yes.

7648. The second reason is that at 1s. 6d. in comparison with 1s. 4d. you have a bigger margin with which to confront any rise in the price of silver. At the same time you would deprecate equally any attempts to raise the rate to 1s. 8d. What are the specific evils which you would apprehend from such a policy as that, from raising the rate to 1s. 8d?—As we say here, it would necessitate a considerable deflation and the readjustment of conditions generally. We do not want a readjustment of conditions.

7649. That argues that conditions are adjusted at the present time to the 1s. 6d. rate?—We consider they are.

7650. Setting aside such evidence as is provided by index numbers, which is the first evidence to which one would refer, are there any other sources of information to which you can refer us from which we can ascertain whether or not the internal prices are now in adjustment with the 18 penny rate?—We think that the trade of the country is extraordinarily good at the present time, which we think is an indication that things have settled down at the present rate of exchange. The Viceroy quoted certain figures in his speech to the Associated Chambers of Commerce the other day which went to show that the trade of the country at the present time is better that it has ever been.

7651. If the rupee were either overvalued or undervalued externally in comparison with the internal value, I gather you would expect that to be imposing a handicap either upon exports or upon imports which would reflect itself in adverse conditions in

the general trade of the country?—I think it would affect the trade of the country.

7652. From the absence of such an adverse state of affairs and the comparatively prosperous state of affairs you argue that the rupee is neither overvalued nor undervalued externally, but that there has been such an adjustment as facilitates foreign trade in normal channels?—Yes, we think that trade is very good which goes to show that the present rate of exchange is right.

7653. In order to make the basis of your view quite clear, in the last words of the paragraph under question 3 you say that "the rate to be selected ought to be the rate current at the time of selection." We should be right, I gather from that, that you select the 1s. 6d. rate not as having an absolute advantage in comparison with any other but because it happens to be the rate to which, in your opinion, prices have now adjusted themselves, and that if it happened to be some other rate you would have recommended that other rate?—Yes, if we were equally satisfied that everything had been adjusted to it, and that it would not be an abnormal rate.

7654. Now we come to the question dealt with in your following paragraphs as to the basic currency system for the country. Might I summarize your recommendations by saying that you recommend as an immediate measure the adoption of an improved gold exchange standard and as an ultimate end towards which to work the introduction of a gold currency?—Yes.

7655. In the first place, then, we have to deal with the measures which you recommend in order to establish an improved gold exchange standard. You say at the head of the paragraph under questions 4 (*a*) and (*b*): "Under the pre-war system in order to avoid unnecessary movements of gold Government frequently entered the exchange market through the medium of the sale of Council Bills or Reverse Councils as the case might be, thereby facilitating trade remittances in whichever direction the demand might arise. This system insured stability for a number of years and the Committee would be disposed to favour its re-introduction." Your Committee recommend the method of sale of Councils and Reverse Councils in preference to the recently introduced method of the direct purchase of sterling in India?—No, Sir. We answer that question in paragraph 7 (*a*). What we are discussing here is whether Government can keep exchange level by Councils and Reverse Councils or purchasing in India or wherever it suits them to do it or whether the gold should actually be shipped backwards and forwards.

7656. What would the opinion of your Committee be as to the relative merits of the two methods, the method of Council Bills or the method of purchase of sterling in India?—That I think is fully answered in paragraph 7 (*a*).

7657. It is answered by the recommendation that the remittance operations of the Government of India should be conducted by the Imperial Bank? You say that the Government should be free at any time to adapt themselves to the conditions of the moment, etc. Of course I follow that, if the remittance operations be conducted by the Imperial Bank, that involves an abandonment of the method of Council Bills?—Yes, but they might use tenders.

7658. I will ask you about tenders later. I gather that you are not here expressing an opinion hostile to the present method of purchase of sterling in India?—No, Sir.

7659. Then you make the recommendation that your Committee "think that an undertaking should be given in respect of both the maximum and minimum rates of exchange in any future scheme of stabilization," so that the obligation should he equally to buy and sell?—Yes.

7660. You look upon that as an essential feature in a scientific gold exchange standard system?—Yes.

7661. In paragraph 4 (*c*), as regards the composition of the gold standard reserve, you recommend "that it should contain a considerable proportion of gold." What is the basis of that recommendation?—Our feeling was that it might be required in gold and that it might not always be easy to get gold.

7662. Might we put it in this way, that if you keep all your reserves in securities, even though they be short term securities, you may find your reserve unduly demobilised at a time of crisis?—Yes, Sir, and export of gold might be prohibited or some such regulations might be brought in by which India would not be able to get gold, if she does not actually possess it.

7663. As regard the location of the actual gold portion of the reserve, is there any opinion held by your committee as to what that location should be?—The gold to be held in London?

7664. The gold held in the gold standard reserve. I think you state in the third paragraph that a portion of the gold should be located in India?—Yes, that was our idea, a portion in England and a portion in India.

7665. And such gold as is held in England should be earmarked? That is also one of your recommendations?—By earmarking we mean that we can always get it even though export were prohibited and also it can be taken without disturbing the London market. We did not want it to be included in the gold balances in London.

7666. Even if it be held in the gold balances in London, it would serve as a basis for credit in India, would it not? Does it make any real difference whether it is earmarked or not?—We do not know what the word "earmarked" quite means in London. All that we meant was that it should be entirely in a separate place of security and should be there whenever India wanted it. Whether they actually use the expression "earmarked" in the Bank of England I do not really know.

7667. Ignorance as to what the phrase "earmarked" means is not an ignorance peculiar to yourself. The question is whether it makes any real difference as regards its use as a basis of credit and where the credit is employed whether it is earmarked or not. You are trying to supply the word "earmarked" with a meaning by assuming that it means that the Bank of England makes a public announcement that they have gold to the amount of A in their vaults that belongs to the Government of India?—(*Mr. Rushforth.*) We want to be quite sure that no regulations regarding the control of gold in London apply to that particular gold. There is a strong feeling that the Indian gold in London is not always available and our idea was that we should have absolute control of any gold that was left there.

7668. Why should that gold be held in London rather than in India?—Because it saves the expense of shipment. It is obviously uneconomical to get gold backwards and forwards and in order to meet Indian sentiment in that way and to allay any sort of suspicion that the gold left in London is not really Indian gold, I think it might be earmarked in some way so that there may be the satisfaction that it could always be got under any circumstances.

7669. Whether or not that would be a positive satisfaction becomes rather a psychological question?—Yes.

7670. Finally, you complete your structure for a scientific exchange standard by your important recommendation that when the gold exchange reserve is drawn upon for exchange purposes a corresponding contraction of the currency in India should be made. Is it possible to amplify at all how you would ensure that the contraction should be made on the reduction of the reserve?—I think one would have to lay down that the gold standard reserve should be used for purposes of transfer only, that it should not be used for purposes of loan.

7671. What does "transfer" mean?—By transferring, you transfer from the gold standard reserve in London to the Treasury balances, and from the balances to the gold standard reserve in India. Any

operations would be in the nature of transfers from London to India.

7672. Would that secure an automatic contraction of the currency in India?—Provided your gold standard reserve in India were held apart, as a separate reserve.

7673. I do not quite follow for the moment how that would make it impossible to let out the Indian currency after it had come in again. I will put it in this way. What one wants to ensure is that, once local currency has been brought in for the purpose of some form of international payment, the fact that the international payment is made out of the reserves and has reduced those reserves makes it impossible that that currency which has been paid in India should get back into circulation in any way, and the question arises what machinery will secure that end?—In olden days they used to lock up 6 crores of rupees in a special currency vault and they could do the same sort of thing again. If people tendered 2 crores of rupees for 2 million pounds of gold standard reserve, those 2 crores of rupees would be locked up thus.

7674. That was done as a matter of policy and not as a matter of obligation. What we desire to secure is that it should be a matter of obligation that there should be some provision that would make it impossible to let out that currency?—Yes.

7675. Would it lead to such an obligation if we were to adopt your suggestion that the gold standard reserve should be used only by way of transfer and not by way of loan?—I do not quite know if that would be the technical way of expressing it. There should be some sort of statutory obligation. I understand at present there are no statutory rules for governing the gold standard reserve.

7676. There would have to be some sort of statutory obligation that a reduction in the reserve should be linked to a reduction in the internal currency?—Yes.

7677. Now I turn back to a central feature of your proposals, to the second paragraph of 4 (*c*). You say that the gold standard reserve " should be allowed to increase to a much larger figure than £40 millions " and the profits on coinage should continue to be added to it. I imagine it would be imprudent to look for any profits on coinage in the near future, would it not?—(*Mr. Campbell.*) No; we do not anticipate any profits on coinage.

7678. " Together with the interest on the investments "?—That is a considerable figure.

7679. " No decision should be arrived at as to its ultimate size, as it might be permitted to increase until it was large enough to allow of the introduction of an effective gold standard." I understand that it would be your policy thus to increase the gold reserve with a view to using it some day for the introduction of a gold currency. Have you been able to give any consideration as to the actual measures by which you would ultimately proceed, when your reserve was big enough, to introduce the gold currency?—We had not thought anything out in detail. Our idea was to start gradually with a large value gold coin. We mention it in paragraph 6 (*a*).

7680. The measures to which you look forward are the measures referred to in paragraph 6(*a*)?—Yes.

7681. We will deal with those when we come to them. You are in favour of the idea " that the note issue and the whole of the monetary reserves should be under the control of a central banking authority," and you say, " this would involve the reconstitution of the Imperial Bank of India." I understand that the principal measures of reconstituting the Imperial Bank to which you refer are, firstly, that the shareholders should become consultative and advisory with a limited interest in the profits; secondly, the transfer of the personnel of the Currency Department; thirdly, that in the new constitution of the Imperial Bank the Government should have a large measure of control. As regards this third essential in reconstitution, I gather it is the opinion of your Chamber that the Government has not at present a sufficient measure of control over the Imperial Bank?—It is rather difficult for me to say. I have nothing to do personally with the Imperial Bank and I do not really know how much Government do exercise the control which I believe they could exercise if they wished to do so.

7682. What is known to the public is the present constitution of the Imperial Bank as regards to appointment of Managing Directors by the Government, and so forth. In considering that formal constitution, would it be the opinion of your Chamber that that did not secure a sufficient measure of control to the Government?—Our view was that the whole matter would have to be very carefully considered. We have not got very much information regarding it and we thought the matter would require the fullest consideration; the whole scheme would have to be gone into from beginning to end and considered at one time.

7683. The principle upon which you are proceeding in the recommmendations being that the Imperial Bank should be substantially controlled as to its policy by the Government?—Yes, Sir. We do not want too much Government control but a sufficient control.

7684. To secure what ends should the system of control be devised? Is it to secure that the general policy of the Bank, as regards control of currency and exchange, should proceed from the Government?—I think that should be supervised by Government.

7685. One feels that the practical difficulty is whether the Government is actually to give the Bank its policy or whether the Government is only to have power to intervene if it does not approve of what the Bank is doing; or, to put it in another way; whether the Government is to be the actual active controlling power as regards currency policy or whether it is only to have a power of veto and (I use the word in no derogatory sense) interference to protect the public interest. Which would you look upon as the ideal to be served?—I think the latter. We think that the Bank people can probably do best but we would like the Government to keep an eye on it and as far as possible not to interfere but if necessary to exercise their veto.

7686. It is common in other countries to deprecate Government control of a Central Bank of issue on the ground that Government control means a danger of political influence. Have you given any weight to that consideration?—We are very much against political influence. We think that business people can run a bank better than the politicians.

7687. Are you of opinion that Government control can be secured in such a manner as to obviate the danger of political influence upon currency policy?—If we were to hand it over to the Imperial Bank I think it would be a step in that direction; political influence is more likely to be avoided than if it were left entirely in the hands of the Government.

7688. Finally you say in this connection that every precaution should be taken to prevent the creation of a banking monopoly. In that connection, does your Chamber recommend any restrictions upon the classes of business in which the Bank may engage? In view of this recommendation one is concerned to enquire what is the nature of the precautions that you recommend to prevent the creation of a banking monopoly?—Our view was that that point should be considered in detail when the whole thing was gone into and it was a general recommendation that monopoly should be avoided.

7689. Might one put it in this way, that your recommendation is a general recommendation that the Central Bank should be a bankers' bank, and that it should not be in a position to make use of its special advantages to enter into competition in ordinary business with other banks?—Yes, except in places where other banks do not exist. We think

it ought to be a trading bank. To encourage banking in the country it has got to be a trading bank in certain places in order to open up banking throughout India.

7690. Can you express any opinion as to whether it is practically possible to limit the business which the Bank can conduct in one place and to remove those limitations as to the business which it can conduct in another place. Is that possible for a bank?—I think you can distinguish between external and internal business to a great extent.

7691. That is a distinction between the general nature of the business which it is to conduct, not a distinction between the business which it should conduct here and the business which it should conduct there?—We have not gone into that point in detail.

7692. In paragraph 5 (*d*) you deal with the question of the rupee note and small notes in general. I understand that, generally speaking, your Chamber are in favour of the one rupee note?—Yes, Sir, it was very much appreciated.

7693. And they regretted the decision of the Government to withdraw it?—Yes.

7694. I understand that was based upon your practical experience. As you say, the note was readily accepted, and it quickly became popular, especially in the jute districts?—Yes, Sir, in Eastern Bengal.

7695. We have been told, on the other hand, that the note was unpopular because it was not infrequently destroyed in the hands of the holder, and that it was looked upon therefore as an undesirable form of currency. Have you any comment to make upon that?—There were certain complaints about it when it was first introduced but I think the number of these one rupee notes which went into circulation is a proof that they were exceedingly popular with certain classes of people.

7696. Then you adduce the further reason in support of the one rupee note that, if at any future date it became necessary to restrict the issue of silver rupees, you would already have a medium of circulation which the people were used to and could make further use of in substitution for the rupee?—Yes, Sir, if you suddenly came out with a new issue it would be more likely to create suspicion than if the issue which was already going was further extended.

7697. So that you look upon the one rupee note as a further insurance against the evil consequences of any overtaking by the price of silver of the bullion value of the rupee?—It might be useful in a temporary crisis.

7698. Now we will resume consideration of your proposals for the ultimate introduction of a gold currency. I understand your first proposal is that you should introduce a convenient gold coin. That would be an Indian gold coin, as I understand?—Yes.

7699. As an essential of that you would have a mint at work which would freely coin gold brought for coinage?—We did not think it was absolutely essential. We thought it was a matter of cost, whether it was cheaper to get one's gold coined in India or elsewhere, but we are not against an Indian Mint coining Indian coins. In fact I think Indian sentiment wishes it and we have got no objections to it.

7700. You consider that the matter of sentiment is something to be positively weighed against the question of any additional cost?—Yes, provided the cost is not out of all comparison.

7701. This gold coin should be so adapted as to give a convenient relation to whatever ratio is fixed for the exchange value of the rupee?—Our idea of a gold coin was that it should be of so many rupees; exchange value would not come in.

7702. Thus, if the ratio of 1s. 6d. were adopted, avoiding the difficulty of having imperfect fractions of rupees in the gold coin to be made current?—Yes.

7703. Could you amplify your proposals by telling us how you would put this gold coin into circulation?—Our view was that it could only be done slowly and according to the circumstances which obtained from time to time. It might be possible to do it more one year and less in another but we could not state any definite amount that should be given out from year to year.

7704. That would depend, no doubt, upon the rate at which your gold in the gold standard reserve was depleted?—To a certain extent, yes.

7705. Would it depend upon anything else?—(*Mr. Rushforth.*) It would have to come out of the paper currency reserve in the first place, in exchange for rupees?

7706. That is the way in which it would get into actual circulation, that rupees would be brought in and gold would be let out of the paper currency reserve?—That is what would happen.

7707. And then what? The paper currency reserve would receive transfers of gold from the gold standard reserve?—(*Mr. Campbell.*) Yes, and the gold standard reserve make up the difference against the melting down of the rupees which they brought from the paper currency reserve.

7708. Receiving as a credit against the debit whatever was realised on the sale of the bullion in the rupee as and when it was required?—Yes, the gold standard reserve would make good the deficit on the rupee as between its face value and its bullion rupee.

7709. Therefore the extent to which you can undertake the encashment of rupees in gold would depend upon whatever surplus there was in the gold standard reserve?—Yes; it would eventually.

7710. And that would depend upon the rate of accumulation of interest in the gold standard reserve?—Yes.

7711. I understand you would undertake the obligation to give gold against rupees precisely in proportion to the gold available for the purpose from the gold standard reserve?—Yes; I take it you would decide how much was available for that object, and then give it out accordingly.

7712. The cost of that would be the cost of the loss of interest on the gold standard reserve?—(*Mr. Rushforth.*) The gold standard reserve would actually be reduced in amount; it would not be in the nature of the transfer transaction that you referred to previously.

7713. You would fix no doubt in the first place some minimum for the gold standard reserve below which you would not make use of this gold?—I think one would have to settle from time to time how much you can spare.

7714. If one assumes that the gold standard reserve is not to fall below its present amount (let us make that assumption for the present), then the cost of your gold currency would amount, would it not, to this, that you are no longer receiving, as you are at present, in relief of revenue the interest on the gold standard reserve?—Yes.

7715. Then ultimately you look forward to the time when you will make the rupee no longer legal tender?—(*Mr. Campbell.*) Yes.

7716. Do you contemplate that before that is done it is necessary to give the holders of rupees an opportunity of converting them into gold?—Yes.

7717. You would not, therefore, dethrone the rupee until the holders of rupees have had an opportunity for such conversion?—I would not.

7718. And you would not be able, therefore, to undertake the final dethronement of the rupee until you had sufficient gold accumulated to undertake the legal obligation to convert into gold whatever amount of rupees you estimate might be presented?—Yes.

7719. You say "it will be necessary, the Committee think, even when a gold standard is established, to provide a gold exchange reserve or a suitable proportion of the currency reserve, in London to meet

any temporary crisis caused by an unexpected weakness in exchange." I may be wrong, but I rather gather that the basis of that recommendation is this, that you have used your gold to some extent by putting it into circulation; that gold in circulation, according to common experience, is not readily available as a means of international payment for the support of exchange; and, therefore, you come to the conclusion that it is still necessary to keep some special reserve to supplement the gold in circulation in support of the external value of the internal currency?—Yes; we felt that there might be a time when it might not be possible to move the gold or get the gold sufficiently quickly to send it home, and it might be necessary to have a certain amount of gold there to draw on until that difficulty had passed. We understand that in other countries it is done; for instance, England at present has got large credits in America to tide over any difficulty like that; and we have been told also that Japan has gold in both England and America for this same purpose.

7720. Great Britain would hardly be a case in point, would it, because in Great Britain, under our present system, the internal currency is inconvertible and there is no gold in circulation; we are in substance on an exchange standard?—Yes, that is so.

7721. But here your recommendation applies to a state of affairs where there is gold in circulation and the internal currency is convertible?—Yes; it does not apply quite to the same extent; but the idea is the same, namely, to tide over a difficult period.

7722. If the convertibility of the note circulation under these conditions of a gold standard were adequately protected by the paper currency reserve, and if the gold in circulation were readily available for export, then there would be no necessity for any further reserve for the protection of exchange, would there?—No foreseeable necessity; but we are particularly anxious not to risk anything.

7723. One question on the remittance business, as to which you have already been so good as to answer one or two questions. You say towards the middle of paragraph 7: "On the other hand, in a falling market it might be advisable for the Government to adopt a different method, possibly to revert to tenders in India or in London." Can you explain why the method of tenders is specially to be recommended in the case of a falling market?—*(Mr. Rushforth.)* We only think that the Government should be at liberty to adopt that method, if they found that by entering a falling market they did not cause too much disturbance. We do not think their hands ought to be tied in any way at present.

7724. That general point of policy would apply, would it not, to operations in the market in either sense, rising or falling? You reserve it here to a falling market: I thought perhaps there might be some special point in that?—*(Mr. Campbell.)* A falling market is always a more difficult market to deal with than a rising market; we merchants always find that.

7725. At the end of that paragraph I find a special explanation that by the word "Government" the Committee means the Government of India, as they consider that the Government of India are in a better position to regulate these operations than the Secretary of State. Is there anything to be said in amplification of that opinion?—I think not, except that we think they are more closely in touch with the actual position and therefore have a better idea of the feeling of the market.

7726. You say in your final paragraph under this heading: "The Government will be unable for a considerable time to come to divest themselves of responsibility to the public for the maintenance of exchange at whatever ratio may be fixed, and it will be necessary therefore for them to retain full control of the management of remittances, though the actual operations might be conducted through the Imperial Bank as at present." What would be the effect upon your opinion in this matter were your recommendation to be adopted as to the transfer of the control of the note issue and the responsibility for exchange to a central bank?—We say the Government would be unable for a considerable time: we thought it was bound to be a considerable time before any such transfer to the Imperial Bank could possibly be made: our advice is that it could not be done under two or three years.

7727. You contemplate that, when the transfer of the note issue and the responsibility for exchange is made to the central bank, it is natural that the central bank should also conduct the remittance business of the Government of India?—I think we would like to see that; it is a matter which has to be considered in detail when the transfer is made, as also the terms of the transfer.

7728. Lastly, we come to the question of seasonal elasticity in the currency system. I understand there that you express general satisfaction with the basis of the present system?—We like the results, but we do not quite like the way it is done.

7729. What are the criticisms to be made upon the way in which it is done?—The bills which are deposited with Government by the Imperial Bank are not bills against actual goods; they are purely accommodation Bills. The actual position is that a great deal of raw material is purchased by buyers in Calcutta; they pay cash (or very nearly cash) for the material from up-country, and do so by operating against a current overdraft from the Bank. When the Bank want bills to deposit with Government in order to get more currency they ask the people who have got overdrafts to draw bills and then give them the money against the Bill instead of against the overdraft. The result is really that it is only a bill in reduction of an overdraft and not a bill against goods which remain to be paid for. In practice the result is the same, because though in the first place the goods have been debited against overdrafts, they are afterwards reallocated against the bills; but it is not quite right.

7730. It is true that there is no bill in the first place, and that somebody has to be stimulated into producing a bill to serve as a security; but as a matter of fact the transaction by its nature is one which is appropriate to be financed by a trade bill?—Yes; we agree; only the original bill is not drawn as it should have been.

7731. It does not mean that the bill, when it comes into existance, is any the less a real trade bill because it is brought into existance by somebody being stimulated to make it?—It is not drawn by the original owner of the raw material, the man up-country who sends, say, jute down to Calcutta; he does not draw the Bill; he has been paid cash.

7732. The criticism of the system really is that, owing to the course of business in India, there are not enough real trade bills drawn to provide the necessary basis for the seasonal currency?—Yes; I understand there are practically very few trade bills drawn. It is not the custom of the country and we should like to see that increased.

7733. That suggests that there are two possible policies to be adopted; (1) either to find some other basis for the seasonal increase of currency in addition to trade bills, or (2) to adopt measures to increase the number of trade bills available?—Yes.

7734. And I understand that your Chamber recommend the latter course?—Yes.

7735. Opportunities should be given in order to promote the number of trade bills which come into existence?—That is our view.

7736. And the opportunities which you actually recommend are the abrogation of the stamp duty, in the first place, and, secondly, that the Government should set an example by insisting on suppliers drawing bills on them for goods supplied to them?—That is so, to encourage the bill habit in the country.

7737. You do not make any suggestion as to the enlargement of the nature of the securities against

which the seasonal increase in currency may be brought into being?—No, Sir, we think the securities are quite good. It is only the manner in which the bills are drawn which we think is wrong.

7738. (*Chairman.*) Now I will ask you to be good enough to deal with any supplementary questions which my colleagues may have to ask you upon the memorandum.

7739. (*Sir Norcot Warren.*) I refer you to question 5 (*a*) under which you say: "In the new constitution of the Imperial Bank, Government should have a large measure of control, and every precaution should be taken to prevent the creation of a Banking monopoly. The interests of the Exchange Banks and indigenous Banks should be carefully safeguarded." Am I right in assuming that what your committee desired to emphasise is that, whilst desiring a clearly defined co-ordination of banking interests for the benefit of the country as a whole, they are anxious that nothing in the nature of a monopoly shall be permitted and that a definite demarcation of banking interests shall be arrived at whereby the operations of the Central Bank shall not clash with or prejudice the interests of the exchange or indigenous banks? Am I right in assuming that that was what was in the minds of your Committee?—Yes.

7740. A little further on you say that the Imperial Bank should "encourage the banking habit throughout India by opening new branches, but as a general rule new branches should not be opened in places where other well-conducted banks already exist." Could you tell me exactly what was in the minds of your Committee when they said that as a general rule new branches should not be opened in places where other well-conducted banks already exist?—Our view was that the Imperial Bank should open new branches in order to encourage the banking habit. Presumably the Imperial Bank will only be able to open a certain number of new branches and if there is already a well-conducted bank catering for the banking business in a particular place, we would rather see the Imperial Bank go somewhere else than to the place where banking facilities have already been provided.

7741. Well, that is only considering the banks. But shouldn't we consider the people who deal with the Banks? For instance, we have opened a hundred branches, as you know, up to the 27th of January next. And the opening of these branches postulates a degree of unavoidable competition with other banks but in my opinion this is not necessarily unhealthy and the absence of it must, I think, be of doubtful benefit to the trade and to the country generally since a monopoly must tend to lead to excessive rates which is bad for the development of trade. As a matter of fact, I have had an examination made of the effect of the opening of the Imperial Bank at a number of the larger new branches and I am satisfied that the general tendency of the Imperial Bank's operations at these places has been to reduce to a more reasonable level the rates for bills and remittances. Isn't that all for the good of the country?—Provided that the banks already there have a reasonable margin of profit. If there is a bank already in existance at that place, we don't want the Imperial Bank to come along and cut the rates so fine that that bank has to go out of existence.

7742. You mean to say you advocate one bank in one place able to charge any rates they like because there is no competition?—I said well-conducted bank.

7743. Well, a well-conducted bank can charge high rates?—We don't consider that it is a well-conducted bank if it charges an exorbitant profit.

7744. I have known cases up-country where they have charged excessive rates?—By well-conducted banks we meant banks that do not charge excessive rates.

7745. Don't you agree that competition is good?—To a certain extent, yes, as long as there is a policy of live and let live.

7746. Well, suppose you had a well-conducted bank up-country charging 8 per cent., say, for a loan for six months and another bank came along and charged 6 per cent., you would not call this reducing the rate very much?—It depends on the conditions of the money market in India. 8 per cent. might be reasonable or unreasonable.

7747. The only way you can bring rates down, in my opinion, is by competition, and I personally would welcome more banks up-country in every place?—From the merchant's point of view, quite so. But if there is too much competition there may be not more banks but less banks. If you are going to drive out other banks, on the whole eventually you *will* end up with less banks than you started with.

7748. Then you think we are hurting the indigenous banks at these places where we have opened?—I don't say that. I cannot speak with authority on the subject.

7749. You read "Capital", and I suppose you have seen that the Allahabad Bank's dividend, since the Imperial Bank opened in 1921, has been at the rate of 18 per cent., whereas the Imperial Bank has only paid 16 per cent. So we cannot have done much harm?—We are not talking about the past, Sir. This is a recommendation for the future.

7750. But what I want to get at really is, why you should object to our opening in places when other banks are there already?—I don't object if there is room. If there are two banks there and there is room for a third, we have got no objection, especially if the banks there are not being managed properly.

7751. Well who is to decide?—I think it is a matter for the Imperial Bank.

7752. But the other banks might object?—Perhaps they will. But these things adjust themselves. In considering the opening of a new branch I think that is a matter which you ought to consider.

7753. I think that you and your committee are thinking too much of the banks. I am thinking of the customers?—What we chiefly want to encourage above all things is the banking habit in India.

7754. Well that is the way, by opening as many branches as possible. And we are the only people who are opening?—We quite agree. We look to the Imperial Bank to open as many branches as possible where they are wanted to encourage the banking habit.

7755. Well, there is one more question. In answer to the Chairman,—I may be quite wrong,—but I understood you to say that these crores and crores of rupees of bills that we discount for the bazar, year in year out, are all kinds of accommodation bills?—No, Sir, I was talking about bills which you ask us to give you in order to get more currency.

7756. (*Sir Norcot Warren.*) I beg your pardon. Thank you.

7757. (*Sir Purshotamdas Thakurdas.*) Mr. Campbell, in 1 (*a*) you say the Committee of the Chamber do not feel confident that the present is an ideal time for the attempt at stabilization. You give two reasons for it, (*a*) and (*b*), and under (*b*) you name all the reasons again. One is whether sterling will keep at gold point hereafter or not, and the second is regarding internal conditions in India, especially with reference to a bad monsoon. Your conclusion, however, is—I will read the last few words. "Government should confine their exchange operations to moderating the swing of the exchange pendulum rather than endeavour to bring about equilibrium at a rate which would be unsuitable to Indian conditions." The unsuitable part to Indian conditions is only in connection with poor monsoons, is it not?—(*Mr. Rushforth.*) Not necessarily.

7758. What else have you mentioned?—We have mentioned the external conditions.

7759. Yes. But that is external. I am now referring to internal conditions. If you don't mind I will deal with the external conditions in a minute?

—But our suggestion, Sir, is that the rate might be unsuitable with reference both to external and internal conditions.

7760. I know. I am taking them separately. Your committee give two reasons, one is external and the other is internal. The internal conditions being the easiest to deal with I will take first, and that I find refers to poor monsoons only?—Yes.

7761. I am sure you will agree that that reason will always exist whenever you undertake the question of stabilisation. I mean, you may always feel that next year may be a poor year, the following year may be a bad year too, and with a little ill-luck India may have a third bad year. Therefore, if you attach too much importance to it you will never stabilise. This is as regards the internal reason. Now as regards the external one, that is restricted to the sterling keeping at gold point?—We also mentioned the future of gold prices.

7762. And the future of gold prices. Now every other country which has had dealings with England as the clearing house of the world must have taken this into consideration. South Africa, for instance, or any part of the Empire. Should it not? I will put you then the main question—Why do you attach so much importance to this point for India? Can you quote any other part of the British Empire or of the world which had allowed this to come in the way of stabilisation?—Because it was the cause of failure in the experiment of 1920. We think the Commission are in the best position to judge whether these things are likely to happen again.

7763. At that time India took the plunge first in attempting to set right its policy regarding stabilisation. Unfortunately she failed. Now, we have had several other countries which have tried to attain stabilisation. The best instance one can give is the United Kingdom. Why do your Committee attach so much importance to this fear when no other part of the Empire has attached that importance in any other country?—We said that we do not feel competent to express a definite opinion on these matters. We merely mentioned that because we know that other people who are more competent to express an opinion than we are have expressed doubts.

7764. I have noted that, Mr. Rushforth, In paragraph 6 above. And I think you said, in reply to the Chairman, that when this Commission goes back to England, which is in greater touch with conditions all over the world, they may be able to suggest something. But what surprises me, Mr. Rushforth, is the last paragraph under question 2, where you say that the decision to stabilise should take effect immediately on the publication of the report, assuming that the rate selected for stabilisation is 1s. 6d. Why do you lay down that condition? Whether it is to be 1s. 4d. or 1s. 5d. or 1s. 7d., you are either prepared to accept the recommendation of this Commission or you are not?—(*Mr. Campbell.*) What we have done there is that we have recommended 1s. 6d., and we have assumed, in view of what the Finance Member has said, that, when the issue of the report of the Royal Commission is made, that the rate will be about 1s. 6d., and that being so, if it is about that rate, then we wish it to take effect immediately.

7765. Yes, Mr. Campbell, but your committee has fully taken cognisance of the various uncertainties, going into details in a very minute manner. Then you further say you don't feel fully competent to make up your minds in this connection, but you are prepared to accept the decision of this Commission when they return to England and get more in touch and feel confident that the time is ripe when they may stabilize the rupee. But you put in a caveat and say that the only rate is 1s. 6d. Supposing that the Commission felt that 1s. 7d. would be a better rate, or that 1s. 5d. would be a better rate, may I take it that your Chamber would be equally prepared to accept that?—(*Mr. Rushforth.*) We have replied to that question under question 3. We assume that 1s. 6d. will be the rate at the time of the Report.

7766. In spite of any other conditions with which the Commission may feel impressed in the course of their inquiry in England?—We assume that it will be the rate when the decision as to stabilization of the exchange takes effect.

7767. You say in your statement that it should take effect immediately provided it is 1s. 6d.? If it is anything else than 1s. 6d., should it not take effect?—(*Mr. Campbell.*) I do not say that it should take effect immediately in that case. However, that is a matter that we have not considered. What we do say is, if you confirm the rate as it exists on the issue of your report, then it should come into effect immediately.

7768. Supposing it were 1s. 5d. or 1s. 7d., would you say the same thing then?—We have not considered it from that point of view.

7769. Regarding what you say under 1 (*b*), —"The Committee recall that a point which was considered of great importance to the country as a whole in the last Budget Speech of the Honourable Finance Member, was that fluctuations in exchange had moderated the range of variations in internal prices." Do I understand that you quote the Finance Member there with the approval of your Committee? Do your Committee approve of his operation to this effect?—That is a statement made by the Finance Member, and that is why we mention it.

7770. How then was it a point which was considered of great importance to the country: do I understand that your Committee approve of that statement and that operation of his? I just want to know whether it is being quoted with the approval of your Committee or only by way of information for the Commission?—For the information of the Commission only.

7771. I take it, Mr. Campbell, that that moderation of the range of fluctuations in internal prices was in the direction of lower rupee prices to India as compared with the fluctuations in the world's prices?—You are speaking of the effects of fluctuations in exchange referred to by the Finance Member?

7772. Yes.—I take it that was the general result.

7773. The Finance Member said in his Budget speech that although the gold prices in the world had advanced, by his manipulations of the exchange he had maintained a steady level of prices in India. That is what he said in his speech, and that is what you refer to, that although the world's prices had gone up, in India he kept a steady level of prices?—That was his statement.

7774. Now when the world's prices in at least one important commodity, raw cotton, have gone down this year, would your Chamber recommend that exchange should be manipulated in order that the cotton grower here should get the same range of prices in rupees for his cotton this year as he did last year?—Surely you cannot take particular articles; you must go by the average. Cotton has gone down; jute has gone up. We have to consider average prices, not particular prices.

7775. Jute has gone up in rupee prices owing to a shortage of the crop? That is as extraordinary as anything else. There has been a short crop, and jute went up owing to that. It did not go up with the world's gold prices. I am thinking of the world's gold prices. Cotton is one of the most important articles for instance which India exports, that is why I particularly name cotton. Do I take it that your Chamber would not approve of any such manipulation to support rupee prices internally in case of a drop in gold prices in the world? Do I understand that you prefer stability in internal prices to stability in exchange?—Our idea is that we prefer a stable exchange to stable internal prices.

7776. I would put it this way. Does your Committee approve of the control of rupee prices in India by manipulations in exchange?—It depends on what the level of prices is in the various countries of the world I think.

7777. In no circumstances would your Committee approve of a manipulation of exchange for the purpose of the control of rupee prices?—After it has been fixed, or before it?

7778. Take the present condition?—I think if prices in India were at great variance with prices in other countries, some adjustment in exchange might possibly be necessary.

7779. What amount of variance would justify such a manipulation in exchange; what percentage of variation, 20 per cent. or 15 per cent.?—It is very difficult to say. Index figures are not always reliable.

7780. You say "great variations," and I was wondering?—I mean material variations.

7781. Then regarding 1 (c), you think that the adjustment is complete as far as the rise in exchange from 1s. 4d. to 1s. 6d. is concerned?—Generally I think it is complete; it cannot be complete in every detail.

7782. But on most points it is complete?—I take it you are thinking of cotton wages?

7783. Adjustment generally in India's price levels and wages?—Certain wages I think are adjusted; certain are possibly wrong.

7784. Could you tell us in what particular industries, for instance, wages have been adjusted to the rise in exchange?—I think on this side of India they are all right.

7785. Has there been a fall in wages since the rupee was put up?—I could not tell you.

7786. From some inquiries I have made I learn that wages of labour in jute mills have gone up by 50 per cent. over the 1914 figure, and that wages in cotton mills in Calcutta have similarly advanced too. I have not been able to get at the figure of rise in wages in the coal fields or of the other mining industries. But I understand that in no case has there been any reduction since the rupee appreciated by two pence from 1s. 4d. to 1s. 6d. Can you correct this information of mine or supplement it if it is incomplete, or tell me whether you think that adjustment in wages in these three industries can be said to be complete?—Of course, there is a general tendency for wages to improve in India irrespective of the cost of living. It is difficult to say what adjustment has to be made in regard to the cost of living and in regard to the general improvement which would probably de demanded.

7787. As far as wages are concerned, there would continue to be a maladjustment?—Wages on this side of India at the present time seem to be about right, as far as I know; they seem to be at about the right level.

7788. No adjustment therefore you think is necessary in view of the appreciation of the rupee?—On this side of India, not that I know of.

7789. Either in the coal industry or the mining industry or the jute industry?—Not that I am aware of.

7790. Have you heard of any adjustment in the charges which Government levy such as railway freights, any reduction there owing to the appreciation of the rupee? Have the railway freights been reduced?—There have been reductions in railway freights, I understand.

7791. On the score of the appreciation of the rupee?—I do not think Government have stated their reasons. It was never stated that these reductions were made on account of the rate of exchange.

7792. I was asking you about the last eight to ten months. Your impression is that certain railway freights have been reduced?—They have put down the passenger fares, for instance.

7793. But your impression is that there have been reductions in railway freights here on this side? There have been certain reductions in the rate for coal?—Yes; that was, of course, a demand of long standing—coal always wanted a reduction in freight —coal is always hoping for a reduction in the coal freight.

7794. Now I will refer to question 2, the second paragraph, last two sentences. You say, "in addition it must also be remembered that the rise in the exchange value of the rupee from 1s. 4d. to 1s. 6d. has been largely off-set by the increasing range of tariffs on imported commodities." You have in mind the revenue tariffs or the protection tariffs?—Revenue tariffs for the most part.

7795. But they were levied during the war and soon after?—They have been raised since 1s. 4d. was the prevalent rate.

7796. The revenue tariffs have been raised?—Yes.

7797. The last increase in the revenue tariff on imports, I think, was in 1922?—What we meant to say was that before the war exchange was 1s. 4d. Since that time, since 1914, the revenue tariffs have been very largely increased and compared with pre-war days; the advantage that you now get in exchange is to a great extent off-set by the increase in tariffs.

7798. To that extent the imports are cheaper there; that is all your Committee point out by that? —I do not say they are cheaper. I say the tariff affects the position.

7799. But they are bound to be cheaper to that extent?—It depends on whether the rise in tariff is greater than the rise in exchange.

7800. But to the extent of the difference between 1s. 4d. and 1s. 6d. the imports are cheaper, say, by 12½ per cent.?—But on the top of that you have got to pay very much increased import duty. In some cases it wipes out all the rise in exchange.

7801. The import duty you are paying to-day is the same as you were paying before 1922?—I am comparing with pre-war days.

7802. Now, does your Committee think that this higher exchange is prejudicial to local industries?—It may have individual effects on individual industries. But, as a general thing, we do not think it is prejudicial.

7803. May I read out to you what your Committee said to the Babington Smith Committee in a very elaborate memorandum which they put forward before that Committee? I am reading from Volume III, Appendices of the Report of the Babington Smith Committee of 1920. The memorandum begins at page 63, as the memorandum of the Bengal Chamber of Commerce, and I am reading from page 69. "But the effect of a high exchange must also be considered as regards imports and India's industries. Every effort has lately been made to stimulate India's industrial production; high exchange must, other things being equal, mean lower priced imports, and lower priced imports may well seriously damage, if not cripple, those industries which have been started during the war and have not yet had time to get firmly established. Generally, therefore, it is the opinion of the Chamber that the fixing of exchange at a point independent of the price of silver is liable seriously to affect many of India's exports and industries, if the rate be fixed unduly high, although, owing to abnormal world prices, this effect might not be evident for some time. It is, therefore, the opinion of the Chamber that every effort should be made to stabilise exchange at as low a figure as possible, and they suggest that this can only be achieved either by a debased coinage, definite inconvertibility of the note issue, or, when absolutely necessary, a temporary refusal to encash the note issue." Your Committee were in 1919 definitely for a recommendation to stabilise exchange at as low a figure as possible, and they also unequivocally put on record that a high exchange cripples Indian industries. May I ask if your Committee are of the same opinion to-day as they were in 1919, when they sent this memorandum to the Babington Smith Committee?—(*Mr. Rushforth.*) Was that written at the time when the exchange was somewhere over 2s.?

7804. Yes.—The question whether it is high or low is a relative matter.

7805. I fully realise it. I only wanted to ask whether you think these arguments equally apply to the difference between 1s. 4d. and 1s. 6d. or not when the world conditions have settled down, and we are now progressing towards the normal period?—(*Mr. Campbell.*) For the most part we agree with that. The present Committee have not really gone deeply into the theory of the thing as it concerned conditions in those days.

7806. To the principle that was outlined here by the Committee in 1920, your Committee would still agree?—I think there is nothing wrong in what was said. But the conditions are probably different, and one may not perhaps use exactly those words.

7807. No; to the extent of the difference between the normal exchange and 2s. there is also the difference in the present prices and the abnormality in the world prices in 1919. We are returning more to the normal, and it is an open question whether in normal period a difference of 2d. does not make the same difference as 8d. perhaps did in 1920. As your committee have not said anything about it at all. I do not wish to ask you anything further unless you care to reply.—I do not know what really they were advocating, whether a low exchange instead of 2s.

7808. (*Sir Purushothamdas Thakurdas.*) They advocated as low a rate as possible.

7809. (*Sir Alexander Murray.*) In the very last paragraph of that memorandum, they advocate a rate which was the rate in existence at the time.

7810. (*Sir Purushothamdas Thakurdas.*) I did not observe that as I said.

7811. (*Sir Alexander Murray.*) You will find that the Chamber at the time of writing the statement had in view the rate in existence at the time and advocate that rate in the closing part of that memorandum.

7812. (*Sir Purushothamdas Thakurdas.*) I did not observe it.

7813. (*Chairman.*) Now that our attention has been drawn to it, the Commission can read it.

7814. (*Sir Purushothamdas Thakurdas.*) Under question 3, you say, "they are strongly of opinion that the rate to be selected ought to be the rate current at the time of selection." Do I understand that the rate selected ought to be the rate current at the time of selection, provided adjustments have been complete at that rate then, or irrespective of the adjustments?—(*Mr. Rushforth.*) I think we rather left it to the Commission to decide whether conditions are such at the time as to make stabilisation possible.

7815. Certainly. I was only asking you whether in the opinion of your committee, the rate in existence at the time should be selected provided the adjustments are complete or irrespective of the adjustments. That is all I am asking. I mean, supposing the adjustment of wages to the new rate is not complete; the adjustment in some other articles is not complete; do you say that that rate should be selected, because it is in existence?—If the Commission consider that the fact that those adjustments have not been made is likely to cause serious trouble in India we take it that they would not recommend stabilisation.

7816. And your committee would not recommend either to make the *de facto* rate the permanent rate?—Not if they were of that opinion.

7817. Regarding what you say under 4 (c), I understood you to say in reply to the Chairman that you like the gold to be held in London because it would be wasteful to bring out that gold to India and incur an extra charge on transport. (*Mr. Campbell.*) We are in favour of not shipping just for the sake of shipping, if the money can be saved. We believe in saving money.

7818. But if you can get gold to India direct from the mines you would not prefer that it should be sent to London?—No; I can see no reason.

7819. (*Sir Purshotamdas Thakurdas.*) Under 6 (*a*), Mr. Campbell, you say the committee look forward to the ultimate establishment in India of an automatic currency system. I am afraid I have not been able to follow whether you indicated in your main examination by the Chairman the conditions under which you would like an automatic currency on a gold standard and the period.

7820. (*Chairman.*) The effect of the witness's answer to me, if I may clear up the point, was that the gold currency should be introduced as and when the gold was available by the accumulation of gold in the gold currency reserve. That was the only condition as to time implied in the proposal.

7821. (*Sir Purushothamdas Thakurdas.*) Thank you, Sir, for helping me to that extent. Then I take it that if gold can be available, say, within the next year or two, your committee would like gold currency and automatic gold standard being adopted.—(*Mr. Campbell.*) If sufficient gold is available?

7822. If the required quantity of gold, in order that Government may be able to introduce gold currency smoothly, is available, then your committee have no other objection?—I do not think there is sufficient gold available; but we would welcome a gold standard when it is possible to introduce it without disturbing the country.

7823. My next question was, why not now?—We think it has got to come slowly.

7824. Under question 6 (*a*), second paragraph, you say, "regarding the minting of any purely Indian coin the committee think that provided the Indian mints can produce such coins at a less cost than they can be produced in London, arrangements should be made for them to be minted locally." I think that what you said in reply to the Chairman was that it should not cost more, that the coin if minted in India should not cost more than what it would cost to have it minted in London and brought here. Do you really think that the Indian coin should cost less than the coin minted in London in order that your Committee approve of it being mentioned here?—We understand that a mint will be very much liked in India and if it is not going to be an extravagance, we should be quite willing to see it. If it is going to cost a very small amount and it is worth paying that small amount to let India have it, let her have it by all means. If it is going to be a big cost, a considerable amount, then we say you had better mint the coin where it is cheaper.

7825. If it is going to cost a little more than what it would cost to mint it in London, it might be minted in India?—Yes.

7826. You say "at a less cost than they can be produced in London."—It means that provided it is not an exorbitantly higher cost.

7827. I thought so. That is why I wanted to make it clearer. Regarding 6 (*a*) I understood you to say that you thought that an accumulation of gold would be necessary in order that the rupees may be converted into gold before Government made the rupee restricted legal tender.—Accumulation of gold?

7828. We are told by some that Government would have to accumulate gold here befofe they could declare the rupee restricted legal tender?—(*Mr. Campbell.*) We understand that when you do declare the rupee limited tender that all the rupees which are hoarded will be presented for exchange into gold.

7829. The rupees I take it then may be divided into two classes, the rupees which are in active circulation and the rupees which are in hoards. The rupees in active circulation will continue to be in circulation. The rupees in hoards will be presented for conversion into gold coins?—I imagine the greater part of them will.

7830. I know it is very difficult to get at accurate figures, but what do you think would be a safe amount to allow per head of population for the rupee as a subsidiary coin and as a coin which the people must have because of their small incomes and their small dealings?—I have not made any such calculations.

7831. The rupee in circulation would not be affected and cannot be affected because the people would need it from day to day?—Certainly.

7832. Now if the quantity of rupees which is in circulation and in hoards to-day, or rather supposed to be in hoards and in circulation to-day, works out to Rs. 7 or 8 per head, do you think there is just reason to think that a large quantity of rupees is in hoards?—I have always understood there are hoards of rupees. I have no proof of it.

7833. Nor have the Commission; but several say that rupees are hoarded.—Yes, that is the general opinion I think.

7834. Well I need not trouble you about that because I think it will take us into the region of guesses. Regarding paragraph 8, the last but one, you recommend that Government should set the example of insisting on suppliers drawing bills on them for goods supplied. Who would be accepting these bills?—Government.

7835. When a bill is drawn by a contractor or presented by a contractor and accepted by Government there is no difficulty in any banker or shroff advancing on it?—It is not our practice. You mean bill of exchange?

7836. I am talking of ordinary debit bills. The contractor puts in his bill with the Government department. The Government department takes a month or six weeks, in some cases I have known it to be as long as four months, before they finally pass the bill. Until then the contractor finds his money is locked up and it is he who pays 8, 9, 10 and even a higher rate of interest. I take it your committee recommend that the Government should make such contractors draw on them a bill of exchange?—They do. The contractor would send the invoice and the bill of exchange to Government. Government, if the documents were in order would immediately accept the bill and send it back to the contractor.

7837. Exactly it is the same thing, whether the Government passed the invoice to-day under the present system or whether they passed the invoice immediately the bill of exchange was presented to them.—I do not quite understand what you mean by passing the invoice.

7838. I took up the word " invoice " from what you said. The man sends in his invoice or his bill. The Government take some time before they pass the bill at present?—Before they pay the bill.

7839. Well I mean it is first passed and then the man takes it to the Accountant General who pays the bill. Say I have delivered a certain quantity of piecegoods to the Military Office. I put in my bill. When the authority who is responsible for receipt of it passes my bill, then I present it at the Accountant General's office or the bank as the case may be. —Do you get the bill back?

7840. I get the bill back and I present it to the Imperial Bank or the Accountant General's office as the case may be. The whole delay is in the bill being passed by the Government department. Do you recommend that the Government should force contractors to draw a bill of exchange on them?—I presume Government would be able to accept it.

7841. Forthwith?—Well within two or three days.

7842. Then if they accept it within 2 or 3 days the bill is payable on demand?—No, I would have the bill payable at 60 days or 90 days' date.

7843. That would make the cost to the Government department so much higher. I mean if you are tendering for a contract on the condition that payment is cash on delivery you tender at a lower rate than on payment after two months of delivery. —Certainly, but Government is not at present bound to pay cash on delivery. That is not my experience.

7844. Then you legalise the delay by asking the merchant to draw a two months' sight bill?—Whatever the average delay is; if Government are in the habit of paying within 60 days you will draw a 60 days' date bill. I say 60 days' date and not sight because they might not accept it immediately they get it.

7845. Would you make the further condition that the Government department should pass the invoice and accept the bill when presented, because otherwise till then the bill is useless if it is not encashable. —They must accept the bill within a reasonable time, say 2 or 3 days.

7846. (*Sir Maneckji Dadabhoy.*) I only wish to ask a few questions. I have been forestalled by my friend Sir Purshothamdas about the fixation of rate which you have stated in answer to the Chairman. I understood you to say that whatever rate we may now fix should be provisional, in the opinion of your Chamber. I would like to know in what sense you use the word " provisional." Is it in the sense that it will prevail during the transitional period from the gold exchange standard to the full gold standard, or in the sense that we can revise it when we find again certain conditions not adjusting themselves within six months or a year?—We have not suggested that the Commission should fix any provisional rate.

7847. I want to know provisional in what sense? —I do not think we have suggested a provisional rate.

7848. (*Sir Maneckji Dadabhoy.*) No; you said in answer to the Chairman what the Government of India should do if the Commission were unable to fix a rate.

7849. (*Chairman.*) I think Mr. Campbell accepted the word " provisional " from me. It is not in his memorandum.

7850. (*Sir Maneckji Dadabhoy.*) I do not refer to the memorandum but where they said the rate of 1s. 6d. should be provisionally fixed.—That is with reference to the last paragraph under 1 (*a*) where we have said if the Commission are not convinced that Government can make the selected rate permanently effective it would be preferable to moderate the swing of the pendulum.

7851. So you do not attach any meaning to the word " provisional," that is, that it is to be fixed for the time being?—No; if you are unable to fix the rate, if the Commission is unable to fix a rate which they consider would be permanently effective, then we think, rather than that a rate should be fixed which would possibly not be permanently effective, Government ought to carry on with a provisional rate at the back of their minds. The provisional rate was only in the case of the Commission not recommending stalibisation.

7852. Now 1s. 6d. is only a provisional rate at present?—At the moment it is.

7853. You mean in view of what the Finance Member has said?—Yes, I would call it provisional.

7854. He is keeping it by manipulation. It is merely provisional in that sense. Then Sir Purshotamdas asked you in this connection, I want to make the point a little clearer; under question 3 you say " The Committee do not propose to deal with the question, for as they have already made it clear the rate to be selected ought to be the rate current at the time of selection." So at the time we write our report, say in July next, if the rate is 2 shillings we must go in for 2 shillings. On your recommendation we must take the accident of the period; the mere fact that a particular rate prevails on that occasion, it should be adopted.—No, Sir. We have presumed in our answer to question 2 in view of what the Finance Member has said that at the time of the issue of your report the rate will be in the region of 1s. 6d.; and presuming that the Finance Member is able to do what he said he would endeavour to do we presume the rate will be 1s. 6d. at the time of the issue of the report.

7855. That is you proceed on the assumption made by the Finance Member in his speech that this will be the rate?—Certainly, Sir.

7856. Then a little lower down when talking about the gold reserve you say " No decision should be arrived at as to its ultimate size as it might be permitted to increase until it was large enough to allow the introduction of an effective gold standard." " Large enough,"—those words are rather vague.

What is the idea of your Chamber, what limit do they think is large enough to allow the introduction of an effective gold standard?—We have to know first of all what the number of hoarded rupees is, and I do not think it is possible to answer the question unless one knows how many rupees there are at the present moment in India, in hoards and in currency, the total number.

7857. You have not considered this question?—We are unable to work out any figure. I understand nobody knows the number of rupees at present in India.

7858. We have received some figures.—Yes, calculations have been made.

7859. But you have not made any calculations?—No.

7860. Assuming that 150 crores is the hoard of rupees what will be the amount required sufficient for the introduction of the gold standard?—The difference between the bullion value of those 150 and the face value of those 150 crores of rupees.

7861. That is your idea?—Roughly without going into any great detail.

7862. Speaking about the Imperial Bank lower down you state "The Imperial Bank is at present a trading bank and the private shareholders have a principal voice in directing its affairs and policy. Under the new constitution the shareholders should become consultative and advisory with a limited interest in the profits." I do not understand this, that the shareholders should become consultative and advisory with a limited interest in the profits. Will you please develop this and let us know what exactly you mean by this?—(*Mr. Rushforth.*) That I think is taken from the memorandum on the State Bank submitted to the Chamberlain Commission. It seems to be the scheme of the principal Central Banks.

7863. But in what way would you limit the interest in the profits of the shareholders, I would like to know something about it?—It seems to me that is a matter for banking experts.

7864. And would you make the shareholders consultative and advisory by having a board selected by the shareholders. "Consultative and advisory," what is meant by that? Is not the present directorate which represents the shareholders consultative and advisory; does it not meet this circumstance?—We understand that they have the principal voice in directing the affairs of the Bank.

7865. Who?—The shareholders.

7866. But haven't they got at present a voice?—We understand that they have and the idea of a Central Bank should be that the general interest, the interest of the community at large, would be the first thing to be considered.

7867. But you know that the Government nominates at present 6 Governors, 2 Managing Governors and 4 other Governors. Isn't that a sufficient safeguard for the protection of the interests of the shareholders and the general public?—(*Mr. Campbell.*) We have not gone into the new constitution of the bank; we only want to point out that the matter should be considered very carefully.

7868. One more question: under question 2 you say "The decision to stabilise should take effect immediately on the publication of the Report of the Royal Commission." If we come to the conclusion that stabilisation should be at 1s. 6d. at once, do you think it would cause great economic disturbance?—I think you are bound to get a certain amount of disturbance because there will be some uncertainty; you mean if the report is issued and the Government take no notice of it?

7869. What would be economic disturbance?—I do not know that there will be any, but I think it will be much more satisfactory to know what is being done.

7870. (*Chairman.*) Are not those referred to in your initial three paragraphs, where you analyse the undesirability of the present state of affairs?—I think what was meant by that question was that if the Commission was to say that the rupee should be stabilised at 1s. 6d. would it matter if no action was taken on that for some time? My reply to that was that it would be better that action should be taken at once.

7871. (*Sir Maneckji Dadabhoy.*) One more question and I have done: In the opinion of your Chamber has the exchange at 1s. 6d. remained sufficiently long in existence, that is, the period of 16 months sufficient, to justify us in coming to a conclusion that that would be the correct ratio to adopt?—We have pointed out in our memorandum that during this period we have not been through any bad monsoons, and there are other factors which we have mentioned in the first page which might upset it, but we leave the decision to the Commission.

7872. (*Chairman.*) I understand, Mr. Campbell, that you will be so kind as to assist us again this afternoon?—Yes, certainly.

7873. (*Chairman.*) I think we can undertake not to keep you for more than an hour.

(Adjourned for lunch.)

7874. (*Sir Reginald Mant.*) Mr. Campbell, to revert for a moment to a point which you discussed with Sir Maneckji Dadabhoy and Sir Purshotamdas Thakurdas, your suggestion that if the 1s. 6d. rate were adopted it should be put into operation at once, may I take it that the position of your Chamber is that, a 1s. 6d. rate being in force at present and prices having more or less adjusted themselves to it, it could be made permanent without any disturbance, whereas, if it was decided to adopt another rate, there might be disturbance, there would be certain adjustments to be made in prices and wages, and it might be necessary to wait for a certain time before making it effective. May I take it that that is the position of your Chamber?—We have not really considered the point of waiting. We advocate 1s. 6d. and we believe that 1s. 6d. will be the rate if you do stabilise, and in that case we recommend it to be put into force at once. If it were another rate, then other methods might have to be adopted.

7875. Mr. Rushforth, in reply to the Chairman you gave an interesting account of conditions in India which make it difficult for a large contraction of the currency to be carried out at once. You said I think that Calcutta and Bombay acted as buffers, shock-absorbers, and that they could not withstand the shock of the fall of prices in 1920. I would just like to follow out that line of thought a little. In the first place, supposing there were a sharp rise in gold prices, would that cause an equal strain on the shock-absorbers? Or is it only in the case of a fall in prices that they break down?—I think the difficulty would be more noticeable in the case of falling prices.

7876. Now in 1920 the fall was very abnormal and exceptional, was it not?—Yes.

7877. Such as humanly speaking may not be expected to recur except in the case of such general world disturbance as was brought about by the war?—There was something on a very much smaller scale but it has an interesting similiarity I think about last May, when a weakness of exchange coincided with a demand for currency, and at a time like that I think it would have been very difficult indeed to contract currency without causing a crisis.

7878. Well, supposing there was another sharp fall in prices and the strain put upon the shock-absorbers was too great for them to withstand, what would happen? Would you let exchange go to ease the shock, would you let exchange fall?—I think it would depend entirely on the conditions at the time. It is very difficult to say.

7879. You say at the end of your paragraph 4 (*c*) in connection with the use of the gold standard reserve, that when it was drawn upon for exchange purposes a corresponding contraction of the currency in India should be made.—Yes.

7880. You would not repeat the procedure of 1920 when a certain amount of reverse councils was sold without contracting currency?—No.

7881. Then the only alternative before you would be to cause greater stringency in the money market or to let exchange fall?—We were hoping that if it was decided to stabilise the rupee there would be no possibility of circumstances of that nature which would make it necessary for such a contraction of currency over any period as to cause serious financial difficulties.

7882. It comes to this, does it not, that under present conditions in India you could not maintain a stable rupee against such a phenomenal fall in prices as occurred in 1920?—I don't think it would be possible.

7883. I was wondering whether some idea of that kind was at the bottom of the suggestion of the Chamber that we should not stabilise the rupee unless we were satisfied that sterling would remain on a par with gold. Because against that view it might be argued that, if you stabilise either in terms of sterling or in terms of gold and the two parted company, at any rate you would have one exchange stable. You would be stable with whichever standard you adopted. Whereas if you did not stabilise at all, you would have fluctuations both with sterling and with gold. And I was wondering whether your idea was that it would be a large change in price levels that might divorce sterling from gold and that that was the reason why you would not stabilise unless you were satisfied that the two would remain at the same level.—That was one of the reasons at the back of our minds.

7884. And I suppose you have no means of judging whether that is likely to happen or not?—We have none.

7885. Just one other point. In paragraph 6 (*a*) of the memorandum, you refer to a period of transition during which the public were being educated to use gold-backed notes. What exactly was the idea there?—(*Mr. Campbell.*) We hope eventually that the currency of the country will be in the shape of gold-backed notes and not in the shape of gold coins, but we are rather inclined to think that they won't use gold-backed notes until they realise that the coin has been there and that they could get it so easily so that they would have such perfect confidence in the notes that they would use the notes and not the coin; and we thought it would take a period to get them educated up to that.

7886. But do you contemplate the use of these notes during the period of transition—the gold-backed notes?—We would use the notes as much as possible as long as they have complete confidence in them. If you start straight off with gold-backed notes and they will accept them and believe that they can get gold whenever they want it, there is no objection to starting off straight away with them. But we think it will take time.

7887. And how would you issue them? Would you only issue them in exchange for gold? How would the public get these gold-backed notes?—I think what we meant was that when you eventually get on to a gold currency, the notes would be gold-backed.

7888. Oh yes, that would be comprehensible.—I don't mean that there should be two sorts of notes in the country—unbacked gold notes and backed gold notes. We simply mean that in future the best form of currency for the country would be notes backed by gold and not the actual gold in circulation.

7889. Yes, that is clear. It is only because you suggested the use of these notes during the transition period that I put the question.—We didn't mean the notes would be used during the transition period. We meant the transition period would be during which the public were being satisfied that there was gold there and that after the transition period they would accept the notes in the full confidence that there was gold at the back of them.

7890. You would not issue the notes until you got a gold backing?—I agree.

7891. (*Sir Alexander Murray.*) Mr. Campbell, may I take it that in writing what has been written under paragraph 5 (*a*) regarding the constitution of the Imperial Bank of India, and the future of that Bank you were keeping in view the fact that as a Chamber you were representing various interests, not merely the interests of merchants and manufacturers, but also the interests of Exchange Banks and indigenous Banks, and therefore that you must have found particular difficulty in putting forward the suggestions that you have put forward?—That is quite correct. As I said, we have Exchange Banks and indigenous Banks who are members, and we had views and opinions expressed by a large number of our members which include the Banks and merchants and others and the views put forward were really meant to represent as far as possible the general tendency of the views that were expressed.

7892. I suggest what you mean to convey is that in view of the feeling that you find existing now regarding the Imperial Bank, you think it advisable in the event of the reconstitution which would be necessary if they were to take over functions in addition to those now performed by them that a full inquiry ought to be made into all these different circumstances as suggested by you?—We think it would require a very full inquiry, and it would take some time.

7893. I suppose part of the feeling that appears to be general in the public mind regarding the Imperial Bank is due to, shall I say, some want of knowledge on the part of the public as to the actual relationship that exists between the Imperial Bank and the Government at the present time?—That may be so; I cannot say definitely.

7894. Do you feel that it is partly due to the fact that the Imperial Bank is a new institution and there is always a tendency on the part of existing institutions to more or less resent the introduction of a new institution? I have in mind a remark that I see in a book on American Banking written by a man who was Secretary of the Federal Reserve Board and was Director of Research for that Board. As you know, the Federal Reserve Board was created just before the war, and this man writing here says:—"Before the war the Federal Reserve Banks had been resorted to very little, and there was a kind of understanding among many of the Banks that, if possible, they would avoid dealing with Federal Reserve institutions at least so far as practicable." I mean that is a feeling that often exists on the part of older-established concerns against newly created bodies interposed between them and the public, and it may be said that, as I said before, a good deal of the feeling that exists now regarding the Imperial Bank is largely due to such a feeling as is indicated in the extract I have read from "American Banking."—There is no reason to believe from what has been said to me that such feeling exists. At the same time from my own knowledge, if anybody appears to get any advantage from Government, they are always people against whom complaints are made.

7895. One of the objections we have heard in evidence is that, for instance, the Imperial Bank gets the use of the Government balances free, and that that gives them a definite pull as against the other Banks. But, is it not largely overlooked in that connection that when the Imperial Bank is carrying a large Government balance, it is in the off season as a rule when bank rates are low and money more or less unloanable except at very small rates, even 1 to 2 per cent. On the other hand during the busy season very often the Government balances with the Imperial Bank are very low. Now at the present moment we are entering on the busy season and the Government balances with the Bank are not more than about 4 crores whereas in the off season they were probably up to something like 30 crores. Now that want of knowledge in connection with these things probably influences people to have the feeling against the Imperial Bank which appears to exist.—I think our members know that the Imperial Bank does a certain amount of work for Government

without charge and that the Imperial Bank gains a certain amount from having the Government balances, but I do not think the majority of them have very much idea which way it works—whether there is an unreasonable profit in having the Government balances and so forth.

7896. However, whatever is done, a full inquiry ought to be made into all these circumstances before a new constitution is arrived at?—Certainly.

7897. (*Sir Alexander Murray.*) There is one other thing. Sir Purshotamdas Thakurdas referred to the memorandum by the Bengal Chamber of Commerce presented to the Babington-Smith Committee in June 1919, when he read an extract regarding the effects of a high exchange on India's Industrial production. Now as a matter of fact as a member of the Committee of the Chamber that drew up that statement the facts are fresh even now in my memory, and on looking it up I find that the extract read by Sir Purshotamdas Thakurdas is taken from one of the headings of the Chamber's memorandum called 'Possible modifications of the present system,' and it was dealing with one particular item, namely the raising of the exchange rate to a point independent of silver. The extract, therefore, that Sir Purshotamdas Thakurdas read to you was an extract based upon a discussion arising out of the assumption that two shillings would be a rate which would make the rupee independent of the price of silver.

7898. (*Chairman.*) Are you putting that to the witness, Sir Alexander?

7899. (*Sir Alexander Murray.*) I was giving him the evidence which Sir Purshotamdas Thakurdas produced in order that he may draw whatever conclusion he may.

7900. (*Chairman.*) If it is a question of what conclusions should be drawn from the Report perhaps it might be more to our advantage to discuss them amongst ourselves. Are you putting that to the witness?

7901. (*Sir Alexander Murray.*) I wish to put it to the witness, Sir. The particular statement to which Sir Purshotamdas Thakurdas referred appears as I was saying under a heading, "raising of the exchange rate to a point independent of silver." For a year exchange had remained at 1s. 6d. and had been put up just before the Memorandum was written to 1s. 8d. and the point at issue was that assuming 2 shillings would be the rate which would make the rupee independent of the price of silver, the Chamber were discussing what the effect would be if the rate was put up to such a high point as two shillings, and it was in that connection that they said "Generally therefore it is the opinion of the Chamber that the fixing of exchange at a point independent of the price of silver is liable seriously to affect many of India's exports and industries if the rate be fixed unduly high," and they go on further in the closing paragraph to say, "The requirements of trade demands stability at as low an exchange rate as is in present circumstances possible." They finish up by saying:—"Without further knowledge of the silver markets and production, the Chamber are not prepared to name the rate of exchange at which the securing of stability is possible, but they hope that it will not be found necessary to fix a rate higher than that ruling to-day." Now in view of what I have said, is that very inconsistent with what you yourself say under question 3 in your statement where you say, "they are therefore strongly of the opinion that the rate to be selected ought to be the rate current at the time of selection"?—I do not think there is anything inconsistent between our two statements.

7902. (*Chairman.*) There is just one question which I wanted to ask, if it is not trespassing too much upon your patience. Under question 5 (*a*) in your memorandum your Chamber says: "The Committee favours the idea that the note issue and the whole of the monetary reserves should be under the control of a central banking authority." Does the whole of the monetary reserves there include the gold standard reserve?—Our idea was that it would include everything.

7903. Supposing that the control of the gold standard reserve be transferred to the central banking authority, has your Chamber considered the policy of the unification of the gold standard and the paper currency reserves?—You mean the amalgamation of the two?

7904. Yes?—We considered the question from the point of view of trying to divide the two reserves more completely than they are divided at present to fulfil the specific reasons for which they were created and we found that we could not see how it could be done. But going further than that, we also saw no reason why they should not be amalgamated.

7905. We remind ourselves that your scheme for providing gold for the gold currency in future is that this should be obtained on the credit of the interest on the gold standard reserve?—Yes.

7906. Supposing that there is an amalgamation of the reserve in the hands of a Central Bank, what arrangements would you suggest by which the interest on the gold standard reserve should still become available as a credit against which gold is obtained to be put into currency. To make one explanation of my question, I should have asked in the first place, under those circumstances the provision of gold for currency would become an obligation of the Central Bank, would it not?—Yes.

7907. Would you then propose that this obligation to provide gold for the currency should be undertaken by the Imperial Bank in consideration of the circumstance that the assets of the gold currency reserve are handed over to them?—I could not reply to that question, Sir, without having worked it out in more detail.

7908. Perhaps I might put it in the simplest and most generalized form of all by saying that I understand it would be a feature of your scheme that, whoever held the assets of the gold standard reserve, should undertake the obligation, in consideration of holding those assets, of devoting the interest on the reserve to the provision of gold for currency. Shall I repeat that, because it is a novel aspect? Whoever held the gold standard reserve, whether it were the Government or the Central Bank, should undertake, in consideration of their holding those assets of the gold standard reserve, the obligation of making use of the interest on the gold standard reserve to provide gold to be utilized for the establishment of a gold currency. I think that is your meaning, but I just want to be clear that it is your meaning even after the transfer to the Central Bank?—(*Mr. Rushforth.*) I think that our idea is that the first duty of the gold standard reserve is to maintain exchange, and I do not think that we should be justified in saying that the interest on the gold standard reserve should be applied for the purposes of a gold currency if it thus reduced the reserve to a level inadequate for the support of exchange.

7909. That is certainly a most important reservation, that the utilization of the gold standard reserve, from the aspect of its interest increments for the purpose of introducing a gold currency, is only to be a secondary purpose to its fundamental purpose of being maintained at an adequate figure for the support of exchange?—I think that is our idea.

7910. That we must clear out of the way in the first place. Assuming that the gold standard reserve is maintained at an adequate figure, I understand it is then your opinion that the interest on the reserve should be devoted to the establishment of a gold currency. I think I can put this question quite simply by asking you whether, if the assets of the gold standard reserve are transferred to the bank, it will then, in your opinion, become an obligation of the bank to make use of the surplus interest of the gold standard reserve to provide gold for the currency. If it did not, and if the transfer of the assets were to be made, then your scheme would break down, would it not? Therefore, it appears to me it is necessary to conclude that if the transfer of the assets of the gold standard reserve to the Central Bank were made, it will then

become an obligation of the Central Bank, in consideration of holding those assets, to use the surplus of the reserve accruing in the form of interest to provide gold for currency purposes?—I cannot quite see that the duty of providing the gold for the currency will rest with the bank.

7911. Must not the obligation to provide the gold follow and attend the possession of the assets of the reserve? To put it very crudely, it is out of the increment of the reserve that the gold should be provided?—I think we have said under 5 (*b*) "it is for the authorities controlling the reserve to determine the proportion to be held in securities and the proportion to be held in coin and bullion." I think we might amplify that, and say "proportion to be held in gold coin, silver coin, gold or silver bullion."

7912. Then the point is this, is it not, that if you desire to adopt this policy as regards the gold standard reserve and you are going to part with the assets of the gold standard reserve, you must impose some special liability to carry out your policy on whoever carries out that duty?—Yes, that is true.

7913. It does follow, I think, as a consequence from any proposal to transfer the assets of the gold standard reserve to any currency authority, whether it is a Central Bank or a joint board or anybody else?—Yes.

7914. That is as far as I can carry it in our questions to-day, because it is undoubtedly a point which has not been definitely considered by your Chamber?—Yes, that is so.

7915. (*Mr. Preston.*) Might I ask one question relevant to the last remark? Mr. Rushforth, under questions 4 (*a*) and (*b*) you say, "Whereas by the sale of councils without limit." Without limit? Is it the intention of the Chamber to suggest that Government should sell councils only up to the extent of actual requirements or without limit?—We say at the end that it will be unwise to lay down any hard and fast rule on the subject.

7916. What should we say? Would you rather make that general reply than a definite reply?—Our idea is, I think, that as far as the sterling remittances are concerned, we think Government ought to make their purchases intelligently between the gold points primarily with a view to their own advantage and at the same time considering the requirements of the markets.

7917. What I have in view is this: Certain evidence has been tendered to us in which it is stated definitely that Government should not sell in excess of their requirements. Then the position becomes this: that if Government do not sell in excess of their requirements, the seasonal requirements would be only obtainable by shipping out gold from London. So that gold would be coming out here and accumulating on this side, in addition to the gold the Chairman has been speaking about, augmenting the fund to bring about the gold standard ultimately in view. Would you think therefore that it would be the intention of the Chamber to say that from this point of view Government should not sell councils in excess of their yearly requirements? I do not think we should say that. I should think it is a question of degree. At the present moment, they have sold a certain amount in excess of their requirements, but not to the extent to court criticism.

7918. May I ask just one more question, that is also suggested by a previous question the Chairman put to you and that is in connection with the Committee's idea "that the note issue and the whole of the monetary reserves should be under the control of a central banking authority"? Is it the intention of the Chamber that when the note issue is handed over to the Central Bank ultimately, the notes should still remain the notes of the Government of India or become central bank notes?—Our feeling on the subject was that it should become the central bank note, although in the memorandum included in the Chamberlain Commission's Report it was suggested that although the bank took over the note issue, the notes should still remain Government notes.

7919. (*Mr. Campbell.*) Just one point that Mr. Rushforth has raised regarding 6 (*b*), second line; after "issuing gold," there should be added "for export." By issuing gold we mean to say issuing gold for export.

7920. (*Chairman.*) That might be corrected in the proof when it is sent to you.

The Chairman thanked the witnesses on behalf of the Commission and they withdrew.

Mr. B. CHAKRAVARTI, called and examined.

7921. (*Chairman.*) You are a barrister-at-law?—I have been practising for the last 40 years.

7922. And a member of the Legislative Council of the Presidency?—I am.

7923. I believe you are also the managing director of the Bengal National Bank?—I am not the managing director, I am the chairman of the Bank.

7924. And you have also experience of the cotton industry?—Yes because I am the chairman of a cotton mill; and I am also a landlord.

7925. You have the advantage of a very wide and varied experience of business conditions, and you have been good enough to let us have a brief memorandum* in which you set out the principal headings of your opinions upon the problems submitted to us for reference. I will, if I may, ask you a few questions to give you an opportunity of expanding your opinions upon the subject. What, in the first place, are your reasons for preferring a gold standard, with gold in circulation, to a scientific gold exchange standard?—I am not speaking as an expert. I am only speaking as an ordinary man who has had experience of life and business. The reason why I say, if I may divide it into two parts, in the first place that I should like to have a gold standard is that for some time past for the international buying and selling we have had the gold standard whereas for internal trade we have depended upon our metallic standard which is silver. We have to deal very largely with a gold currency country, that is, England mostly, and to my mind it only leads to confusion to have a gold standard for one class of business and a silver standard for another. That is my first reason. As regards the gold currency, I am speaking on behalf of the general population, that is the agricultural population. The agricultural population is about 80 per cent. in this part of the country, I do not know of the other parts; and Sir I find that the peasant can deal with concrete things. If it is a gold standard he would like to have a gold coin representing that standard. As to any other scientific method it would be very difficult for me to induce him. I have reasoned with him but he can only deal with things that are concrete. He says if gold is to be the standard let the coin also be gold.

7926. What will he do with the gold coin when he has got it?—He will deal with it in exactly the same way if he has the chance of getting a large quantity but if there are only small transactions in which he is interested there will be a minimum or maximum of silver for purposes of small transactions.

7927. In the past when he has got the gold coin he has usually put it in his stocking, has he not?—That is not my experience.

7928. Will you tell us your experience as regards the habits of the people in relation to gold?—Now if you have two, that is, gold and silver, then he has a tendency to retain the gold and he uses the silver; but if he has only one, that is, gold, and also if he can deal freely with the gold, whenever he wants gold he gets it, then there is no inducement for him to keep the gold in hoard. There is a tendency, I do not know whether it is peculiar to my countrywomen—that is, the ladies want a few trinkets and

* Appendix No. 38.

ornaments; probably more so in India than elsewhere; but in more recent times I have noticed there is a marked change in their inclinations. For instance, there is my wife; she would like to have a large quantity of ornaments; but with regard to my daughters and daughters-in-law, they are not so fond of ornaments. On the other hand, they would like to spend the money on bioscopes and theatres and in going about here and there. And if I may point out one more thing. You see what kind of ornament satisfied my wife, who is an old woman, won't satisfy the modern generation; they are out of date; fashions have changed and therefore the gold instead of being hoarded will come on the market and be converted into sovereigns provided you open the mints.

7929. Does the bank with which you are associated do business in many branches?—No it is only a small bank.

7930. Is it a deposit bank?—Yes.

7931. Do you take deposits from the ordinary public?—Yes.

7932. Forgive me for asking these questions on a personal business?—Not at all. I shall be very glad to answer any questions you put to me because my only object is to assist the Commission.

7933. From your experience of deposit banking, do you find that the habit of trusting their savings to a bank for deposit is on the increase or decrease among the ordinary public?—Remarkably on the increase and what I find with regard to this small bank of which I am the Chairman is that we opened savings bank accounts. For a few years we did not attract many people; that is, those who wanted to save small amounts and put those amounts in the bank. During the last 3 or 4 years I find that daily the amount is increasing and there is very little withdrawal.

7934. Is the increase in big accounts or in small accounts?—No, in small, very small accounts.

7935. The number of small accounts is increasing? —Yes and in point of fact we are finding a little difficulty because it is a small amount of money that is brought in by the individual and therefore accounting becomes rather difficult because more people have to be employed.

7936. And expensive?—Yes.

7937. Has there been any special time to which you can date back this increase in the banking habit, or has it been steadily growing?—Speaking generally it has been steadily going on, but I rather think that during recent years there has been a certain amount of movement even with regard to the peasants, with regard to the cultivators, on account of co-operative banks and loan societies in the mofussil, and the general tendency is to resort more to banking than saving up money and hoarding.

7938. How far down does this growth in the banking habit go? Does it go right down to the poorest class of cultivator?—Yes, with regard to co-operative societies, for example, I am speaking of my own district, the district of Jessore, there is a co-operative society there. It reaches the peasant, the actual cultivator of the soil. Then at Jessore there are about three or four banking institutions. I would not call them strictly banking institutions; they are more like loan societies. That is attracting money both from the well-to-do people as well as from the peasants.

7939. What is your experience as regards the preference of the people. Do you find a growing or a decreasing acceptibility of notes in comparison with silver rupees?—I can speak for the last 25 years. I receive in the course of a year about Rs. 50,000 from the country. About 25 years ago I did not get anything but silver and some portion of the silver consisted of bad rupees; but this year for example the whole of the money that I have received is nearly half in notes and in some cases hundred rupee notes.

7940. And you see it, I suppose, on the other side of the book when people come to the bank for cash. What is your experience of the popular demand for silver rupees in relation to notes?—Except for a very small quantity of silver they would sooner have ten-rupee notes than a lot of silver to carry. They are coming to appreciate the usefulness of paper money.

7941. In this connection, what is your opinion on the policy of the small note of less than Rs. 5?—With regard to the experience that I have had about the rupee note, that was not very favourable but I should think that Rs. 5 notes or rather the equivalent of that in gold would be quite popular.

7942. The five rupee note?—The five rupee note or the equivalent of that in gold.

7943. But they have a five rupee note now?—Yes; it is quite popular.

7944. The question is whether it is a good thing or not to have notes of less than five rupees in circulation?—I find that as regards the one-rupee notes the people had a certain amount of reluctance because you have to pile up a number of notes when paying say 25 or 50 rupees; and then a lot of these one-rupee notes got very dirty soon in passing from hand to hand; that was a complaint that I received on several occasions.

7945. Did you find that, on the whole, people were reluctant to take them?—No. I never found any reluctance to take either the rupee note or the silver rupees as long as it was in circulation.

7946. Did you ever hear that people in villages when they wanted to change one-rupee notes for small change had to pay any special discount to the money-changers?—No; I never heard that.

7947. You want to see gold put into circulation?—Yes.

7948. What do you think would be the demand for gold coins in actual circulation?—At present I do not exactly know the actual quantity of gold in the form of sovereigns.

7949. Outstanding?—I should think that there is really a considerable quantity of gold in the form of sovereigns still in the hands of the people. That I think will circulate and will come into the market.

7950. That gold is at present held up as a hoard or as a store of values, I suppose?—If you will kindly pardon my not using the expression 'hoard.'

7951. That is why I provided you with an alternative: I knew the unpopularity of the word?—I think it is kept more in the nature of a contingent reserve against rainy days.

7952. If it is kept for that purpose now, I suppose that the people will still want to keep it for that purpose, will they not, whatever happens, unless there comes a bad year when they have to bring it out?—But once there is a gold standard and gold currency there would not be the same tendency to retain the gold coin. The gold sovereign is retained in the hands of the people because it is far easier and less bulky for the spare money to be retained in that form rather than in rupees. It is really competition between rupees and gold coins.

7953. If they do not keep their gold but bring it out into circulation, in what form will they hold their store of value?—I do not think they will keep any particular sum of money in that form; but it may be in the form of notes or gold sovereigns or gold notes; some portion will be in ornaments.

7954. But that will still be gold?—Yes; but they will have this advantage; supposing they want any quantity of gold as coins; they will send these ornaments to be melted in the mint and get sovereigns. It is more on account of possessing something which is not ordinary that this gold is now held; it is in human nature. Because nobody is using gold every day therefore it is precious; probably it is a sentimental feeling.

7955. What you have told us is very interesting and convincing, that people in India require to hold some store of value against a bad year because the whole thing depends so much upon the good or bad

year, and at present they hold it in gold. If and when we get a gold currency, what will they hold their store of value in? Not gold, you say, because gold will become common and ordinary. What will they hold it in?—With more banking facilities they will put their money in the bank; instead of keeping it in the house they will keep it in the bank.

7956. You think it will in course of time lead to a cessation of the habit of keeping metal in the stocking?—Yes, and more so because in the mofussil life is still open to a certain amount of danger; there are thieves and dacoits and so on and these people are going to the mofussil banks more on account of this danger.

7957. This is a very old habit of the Indian people, is it not, of keeping their store of value in metal?—I am afraid it was an old habit and I tell you the reason; it is an historical reason. Before the British Government established itself we had so much of internal dissensions, war here, war there and so on; independent freebooters down to the time of Ali Verdi Khan came and pillaged and the only way Ali Verdi Khan could turn them away was to give a fourth; that was the origin of the Chauth; in the same way life in those days probably in all parts of the world was so insecure, specially with regard to valuables (I am not speaking of my country only but of all parts of the world), that people wanted to secrete their valuables and money and hoard it. But in these modern days of banking and orderly government and with the settled habits of the people, there is no inducement to keep it in hoard.

7958. Taking a safer instance, it is less than two hundred years since Nadir Shah was in Delhi; but the habits are ingrained in the Indian people, and I imagine you do not think the circulation of gold will cure them at once; it must be a process of education?—It must be a gradual process; but at one time rupees were hoarded; that objection would equally apply to any metallic currency.

7959. Can you give the Commission any information from your experience as to the nature (I do not mean little holdings of silver just as stores of value) of larger holdings of rupees which may be held here and there? In this connection I think we must use the word "hoards"?—I do not think there is much silver accumulated in India; the highest amount even in the case of a prosperous peasant will probably be not as much as 100 rupees.

7960. I am not going to ask you, of course, now to name any particular instances, but have you yourself in the course of your experience come across any large or substantial hoards of rupees?—I remember one instance; that is to say, I did not see it myself, but it was reported to me in connection with the execution of a decree for rent that we obtained. The execution was against the man's movables and naturally his cattle and implements were attached by the execution officer. Upon that it was reported to me that the man opened a hole in the floor of his hut and brought out 50 or 60 rupees. That is the only instance which has recently come to my knowledge with regard to actual hoarding.

7961. That, of course, is a small amount?—Yes.

7962. You have not within your experience come across any instances of large hoards amounting to thousands of rupees?—No, never.

7963. On this question of the currency habits of the people, you have told us that the educative force of the gold currency must of course take time to achieve its effect?—Yes.

7964. At first if gold were to become freely available for currency, what, in your opinion, would be the effect upon the note circulation?—I do not think the note circulation will be affected at all. If anything, if there are gold notes they will be taken in preference to sovereigns.

7965. You would not fear that this impulse towards gold, or what is described as this affection for gold, might not have the effect that people would say: "Let us always have the best, now that we can get it, for every purpose. Let us have gold for circulation in preference to notes"?—I should not think so; they would circulate sovereigns if it is convenient to circulate sovereigns; they would circulate notes if it is more convenient to circulate notes. There will be no special liking for metallic circulation in preference to paper money. I notice that with regard to rupees.

7966. If I remember aright, by far the most numerous notes individually are the ten-rupee and the one-hundred rupee notes in circulation?—At the present moment so far as I know it is the ten-rupee notes which form the bulk of currency notes.

7967. By far the most popular note is the Rs. 10 note and the Rs. 100 note?—Yes, and if I may interrupt you, Sir, for larger payments, for example if a man is buying a house or buying an estate of considerable value then Rs. 1,000 notes and 10,000 notes.

7968. For those larger payments they are not likely to substitute gold because of the inconvenience, but for the demands for which Rs. 10 and Rs. 100 notes are used, is that not just where, in your knowledge, you might expect gold, at first at any rate, to be drawn off into circulation at the expense of the note issue?—I don't apprehend it.

7969. You do not attach any importance to that danger?—No.

7970. Now I want to ask you a more theoretical question. Have you been able to make any estimate of the amount of gold which you would require from first to last to carry out your suggestions as to the introduction of a gold currency?—If that figure is correct that 300 crores of rupees are at present in circulation amongst a vast population, now all that you would have to provide is for that quantity in gold and out of that quantity I won't be quite sure whether 19 or 20 crores something like that you will get out of the existing gold currency, that is in sovereigns. Then if the mints are open, instead of a desire to get gold and store it up, there will be a tendency rather for the purpose of converting the gold into gold sovereigns.

7971. I want, in the next place, to ask you a question or two about the note issue. Are you or are you not in favour of transferring the control of the note issue to a Central Bank?—By the central bank, do you mean, Sir, the Imperial Bank.

7972. I purposely did not say the Imperial Bank; I said to a central bank, a central bank of issue?—A Central Bank under the control of the Government?

7973. That must be part of your answer. Would your answer be that you would be in favour of transfer to a suitable Central Bank?—At the present moment I entertain some doubts as to the practicability of such a Central Bank. No doubt, the Imperial Bank has this amount of disadvantage that it is a bank mainly controlled by its shareholders and naturally with regard to the control of the administration it must be determined by the shareholders. But I have been in touch with the Imperial Bank or rather its predecessor, the Bengal Bank, from the year 1890 and I have been all along in touch with them. Therefore, you may have the idea of a Central Bank independent of the Imperial Bank later on, but at present I think we will get on very well with the Imperial Bank.

7974. Would you be prepared to transfer the control of the note issue to the Imperial Bank in its present form?—With certain safeguards.

7975. What would those safeguards be?—That is to say with regard to the issue of notes the Imperial Bank—I don't know whether it will or it won't—but it ought to submit to more representative administration for the purposes only of the note issue, not with regard to other work.

7976. I understand you are of opinion that, with these safeguards as to further control in regard to the note issue policy, the Imperial Bank, in your opinion, both in the manner in which it is worked

and the way in which it is at present constituted, inspires confidence sufficient to make you prepared to transfer the note issue to the Imperial Bank?—Undoubtedly. If there is no other central bank, which is not now possible.

7977. One final question, Mr. Chakravarti, to which I was leading. Supposing such a transfer be made, what in your opinion will be the effect upon the acceptability of the note issue of its becoming a note issue of the Imperial Bank and not of the Government?—I don't think they will have any preference either one way or the other. They will take it exactly in the same way.

7978. As long as it looks the same?—I am still again talking about the peasant, the actual cultivator who forms 80 per cent. of the population. With regard to his concrete mind, he cannot distinguish between the Government, the Imperial Bank and other institutions. In point of fact, every agency which is practically in the hands of the Government or controlled by the Government, they take it as if it were the same as the Government, whether directly or indirectly.

7979. (*Chairman.*) I am obliged to you, Mr. Chakravarti, for your evidence. There are one or two Members of the Commission who may like to ask some supplementary questions, and I will postpone any further questions of my own, if there be any, until a little later on.

7980. (*Sir Alexander Murray.*) Mr. Chakravarti, you have had a good deal of experience as a business man and as a banker and also in charge of Indian Mills in Bengal. We have had it put to us here some time in evidence that the Imperial Bank has not given all the facilities to the public that it might have given in the matter of accommodation. Now what has been your own experience or the experience within your knowledge?—My experience has been very much in favour of the Imperial Bank because two years ago—I speak frankly, Sir, when I was in difficulty with regard to this small bank of mine because there was a run, the Imperial Bank saved the institution ungrudgingly and so much so that the money was paid up by the Imperial Bank before the papers could be got ready.

7981. Apart from your own experience connected with that Bank, have you had any people coming and complaining to you as a public man that they have not been getting the facilities from the Bank that they might expect?—I don't know of any single instance with regard to business. Of course, with regard to young men seeking cadetship or appointment, I have had cases.

7982. (*Chairman.*) That is common to any institution. I think those are the questions directed towards your very interesting practical experience which I wanted to ask you. Are there any further aspects of the questions opened in your memorandum which you would care to further explain?—There is one matter I suppose that is already covered in a way but there is one matter which I would like to impress upon the Honourable the Commissioners and it is this. The peasant's view with regard to currency has not been particularly rational or logical. I am not concerned with logic or with pure ratiocination. But feeling must be taken into account when dealing with a large number of people. Now, with regard to this exchange at 1s. 6d. they say that "before 1914, I had come to the conclusion because that was the rupee sanctioned by the *sircar bap*, that is the Government, that Rs. 15 was the intrinsic value of the sovereign. If I sold wheat or linseed or jute in those days, if I sold a Rs. 100 commodity—(because he is after all a producer of raw goods)—then I used to get Rs. 100. Out of that I had to pay fixed charges, that is the Government revenue directly or indirectly and various taxes. That absorbed 60 rupees and then after having those I had Rs. 40 in my pocket to deal with for my own purposes. Under this 1s. 6d. ratio, I get only Rs. 87, and the fixed charges are the same. Therefore I have to pay Rs. 60 out of that and for internal purposes, for money purposes, I have to deal with my wants with Rs. 27, whereas I had Rs. 40 then. One objection may be made that your rupee is more valuable. But the value consists in this—provided he was a buyer of imported goods; but he very rarely buys imported goods except Manchester piecegoods. Therefore he thinks, and he attributes all his misfortune to the Government and says, the all-powerful Sircar could put it down, but instead of putting it down, the Sircar Bahadur is allowing me to be cheated of Rs. 13.

7983. That is not an unfamiliar point of view. A critic of your friend, the peasant, who advocates that argument might say to him, might he not, if he thought his intelligence was capable of apprehending so profound a matter, that although you may be getting less rupees for what you are selling, you are paying less rupees for what you are buying, and then your peasant might find it convenient to look at both sides of the picture instead of only one?—This is the point which he makes, that I do not buy anything except probably cloth which is imported. With regard to the bigger people, the bigger merchants and so on, it may be favourable to them, but it is not favourable to me.

7984. Is a man who only sells and never buys a common phenomenon in the economic world?—I did not mean that. He does buy as everybody else, but so far as he is a seller and so far as his export from the country is concerned, he deals in wheat, linseed, jute and various other products. Then he gets his money, he has to pay. If he dealt with manufacturers or with large concerns, probably he would have to buy what is imported into the country, and therefore the two would equalise, but in his case his answer is, "I do not buy." I can get all that I buy created in my own country. Therefore I am not dependent upon what is imported from outside.

7985. If you were supporting him in that argument you would be adopting the contention that the price of imported articles has no effect upon the price of articles grown and consumed only in the country?—Yes.

7986. (*Chairman.*) We are much obliged to you for your further explanations and for your very full assistance to-day.

(*The witness withdrew.*)

TWENTY-FIRST DAY.

Tuesday, December 29th, 1925.

PRESENT:

The Right Hon. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.
Mr. G. H. Baxter, Mr. A. Ayangar, } (*Secretaries*).

Mr. D. P. Khaitan, representing the Indian Chamber of Commerce, called and examined.

7987. (*Chairman.*) Mr. D. P. Khaitan, you have come to assist us this morning as a representative of the Indian Chamber of Commerce?—Yes.

7988. The Indian Chamber of Commerce have been good enough to provide us with a very full memorandum,* so that we understand that on this occasion you will be explaining the views of the Chamber and not your own personal views. Would you, in the first place, tell us for the sake of our record what is the nature of the interests represented in the Indian Chamber of Commerce?—The Chamber consists of members, some of which are banks, some of whom carry on export and import business, some of whom have got jute mills, some have got cotton mills, some are connected in chemical industries, some are engaged in dealing in Indian piece-goods, some in foreign piece goods, some in country produce, some in jute and in fact almost all the various kinds of business carried on in Calcutta are represented.

7989. What is the membership in numbers?—130.

7990. In what year was the Chamber originally founded?—It was founded this year.

7991. It is a new institution?—Yes, Sir.

7992. I will ask you just a few questions upon the memorandum in order to clear up any point that may seem doubtful. In the first place, in paragraph 3, you say, "For a Government to use its currency-issuing authority to pass into circulation as standard currency over-valued coins is open to gravest exception." By "over-valued coins," do you mean any form of token coin?—For example, in our case, the rupee which is intrinsically worth only about $\frac{11}{16}$th at the present rate of exchange and present value of silver in terms of gold.

7993. That would include any form of token coinage?—Yes, it would.

7994. Would you amplify a little why it is open to the gravest exception for the currency issuing authority to pass such coins into circulation?—Our Committee has a distinction in mind about the really subsidiary coins used as subsidiary coins and standard coins; for example, the rupee has been passed as really the standard coin of the country.

7995. How would you define a standard coin?—The definition of standard coin as we understand it is this: For example, the rupee is not compulsorily convertible into gold of which it is supposed to be a token. The paper currency notes are convertible only into rupees and not into gold. Now the rupee passes as standard coin because it is not compulsorily convertible. If it had been convertible into gold and gold coins were in circulation, the gold coin would have been the standard coin as representing the standard of value. But the rupee not being worth actually as it is intrinsically, it should be supposed to be a subsidiary coin but is really passed as a standard coin.

* Appendix No. 39.

7996. It still leaves me in a little doubt as to what the characteristics of a standard coin are. I suppose that coin is the standard coin of a currency which is in that currency unlimited legal tender, is it not?—Yes; there is the distinction which we understand.

7997. That is the quality of the convertibility?—Not really the quality of the convertibility. Not only the quality of convertibility but also the fact that the rupee by itself does not represent the real value. In order to ascertain its real value you have also to consider the rate of exchange prevailing, and the amount of gold that the rupee can buy is really the standard of value.

7998. Then you would not admit any coin in substance to be a standard coin except a gold coin?—Yes; as gold is the standard of value gold coin would be the standard.

7999. You were going to tell us what the very grave exception to the passing into circulation of an over-valued coin in the sense of a token is?—A standard coin should also be a store of value. It is not simply the standard and measure of value but also the store of value. Now, the rupee is very much misunderstood and then by reason of the fact that the rupee passes as standard coin it leads to the greatest amount of misunderstanding.

8000. May I direct your attention rather more immediately to the point which I thought required explanation? Is it really open to the gravest exception that a Government should pass into circulation any token coin, any over-valued coin?—As the standard coin. If it is done as a subsidiary coin, it would be a different matter. For example, our pies, the copper pice, or the nickel two-anna bit, there is no objection to them. Everybody understands them as subsidiary coins.

8001. I quite follow you. Will you point out whether you would extend that objection to any note issue, because a note in many currencies is, of course, a token in the sense that it is over-valued and yet it is standard currency in the sense that it is unlimited legal tender?—Yes, but the note denominated in terms of gold can be converted into gold; but our rupee cannot be.

8002. The point which you emphasise is that there must be a stable relation to gold?—And convertibility.

8003. And convertibility?—Yes.

8004. But why necessarily convertibility if there is a stable relation? Supposing the gold value of your standard coin is stable, why do you then lay emphasis on convertibility?—Unless it is convertible, unless the people can give Rs. 15 and get a sovereign, the rupee passes and the people have not that confidence in the rupee as they would have if the rupee were convertible into gold; and whatever the standard of value is, that should be quite apparent on the face of it.

8005. Supposing they find out that they cannot get a sovereign for Rs. 15 but that they can always get a sovereign's worth of Rs. 15, then is there any objection to such an issue?—Even then, Sir, there would be that objection that people should be able to see what really the standard of value is. They should know on what standard of value dealings are carried on in the country and if they want that standard of value to be in their hands, they should have the confidence that at any time, the token coin that is passing in the country is convertible and they can get the real standard, the gold in exchange for their token coins, in order to have the fullest confidence in it.

8006. If for a reasonably long period of time they find that the gold value of the rupee is stable, and that they can always get a sovereign's worth of gold for Rs. 15, even though there is not direct convertibility, will that not give them the confidence in the standard of their currency which you say is essential?—I do not think so.

8007. Would not that be a question of time?—On the other hand, if gold coins are once passed into circulation and the people see that the rupees can be converted into gold coins, then after the lapse of certain period, it will be possible for people to have that amount of confidence. But if at the start we begin on the wrong side then the difference will continue and the confidence of the people in India at present having regard to the great changes in value that have taken place in the rupee, has been very greatly shaken.

8008. Your point is that there is only one way to teach people confidence in the stable gold value of the rupee and that is to enable them to get gold for their rupees?—**Yes.**

8009. In the next paragraph you say, " Like other countries, she has a right to be paid for this net surplus of commodities and services by a transfer of gold from other countries." Do you look upon the acquisition of gold as a good in itself?—Yes; the country exports more than she imports and she has a right to get the balance in the form of gold. If other countries want that India should not import gold and should not receive gold in return for goods and services, they are quite at liberty to offer more attractive terms of investments to Indians in other countries.

8010. I have noted that point in your Memorandum elsewhere. The question to which I want to draw your attention now is this; is it an end in itself to a country to get as much gold as it can?—India requires capital for her industrial development, for her agricultural development and for that purpose it is desirable that gold should be in circulation, that gold should be imported, should be passed as coins, should be in circulation in the form of coins in order to furnish the capital that is so much needed.

8011. I do not quite follow that. You cannot use gold in circulation to build a factory; you want goods for that, don't you?—But those goods can only be bought with gold.

8012. Why?—The other countries have to be paid in gold. Firstly, India exports her stuffs and in return she gets certain commodities and the balance is made up by the import of precious metals. Now those precious metals either are forced into other channels or can also be utilised as currency. Now if they are utilised as currency the country has got that amount of capital with which they can import machinery or build their own factories and help in agricultural and industrial development which is so much needed.

8013. But supposing India wants engines for her railways, then in order to buy those she must leave the proceeds of her exports abroad to pay for them, must she not?—It does work out like that. It is only the difference between the import of commodities and the export of commodities that is imported in the form of the precious metals.

8014. As a matter of fact statistics show that India has been obtaining lately an enormous amount of gold?—Not in proportion to her population.

8015. I am sure I do not know what standard you apply there. Whether it is big or small in proportion to her population, would it not be very large in proportion to the amount of gold required by the population of any other country?—How could you say that? India has one-fifth of the population of the world and her imports of gold have not been anything like that one-fifth.

8016. Have you compared the statistics of the amount of gold which, in the course of the last 20 years, has been absorbed by the population of India as compared with the amount of gold that has been absorbed by the population of any other country?—You must know what has been chiefly responsible for it. Now since the 2 shilling ratio was put on the statute-book it was not possible for the inhabitants of this country to tender gold to the Government and to get currency instead. If the 2 shilling rate had not been placed on the statute-book it amounts to this, that whatever gold was imported must go into the country for absorption merely, it could not be utilised for the purpose of currency. It is quite true that after that the Government to a certain extent bought sterling bills and issued currency against it; but even that was not done to a sufficient quantity. Therefore I hope, Sir, you will agree with me that the people of this country are not responsible. Secondly, to a certain extent gold is required by the people of this country on account of their social customs, on account of their traditions they do use gold in the form of art.

8017. Is it your opinion, then, that a large amount of this imported gold is only waiting to come out in the form of currency as soon as there is an effective ratio between the rupee and gold?—Simply an effective ratio would not do it. In course of time if you circulate gold coins that will be the result because then people will learn that gold can be used in the form of gold coins also.

8018. The difficulty I want to put to you is this. If the people who took this gold had wanted anything else they could have got it: they could have got it in the form of commodities, by buying them?—I cannot follow you.

8019. You have people in India who have imported these large amounts of gold in the course of the last few years. If they had wanted something else, cotton goods or any other form of commodity, they could have had them by buying them. Even now if they pleased they could take their gold to the brokers and get currency for the gold. If they have not done so, and do not do so, does not that show that they have taken this gold because they want it for domestic uses, as you say, or for hoarding as a store of value. That being so, what reason is there to expect that this gold will ever come out to be coined?—So far as hoards are concerned—you used the word hoard also—I do not think there is any hoard of gold in the form of gold bars or anything like that. Whatever gold has been bought by the people has been converted into ornaments and much of it is due to our social customs. Now that amount of gold will always be taken by India, there can be no doubt about it; but with the progress of education, with the development of banking facilities, with the training of the people in investment in productive channels instead of converting their surplus wealth so to say into the form of ornaments and jewellery, they will come out to invest them in productive channels and the result that you mention will come about and gold coin will really facilitate that. For example, if a man buys some gold at present the only way in which he can keep it is by converting it into ornaments, but if he can get gold coins he would rather go in for gold coins solely because that would be a very good method of storing it and it can be easily reinvested or re-spent for domestic purposes as also for any purpose he wants; but if the gold is converted into ornaments it must needs be—in the absence of gold coins, the result is that he has to sell a part of his ornaments and there is loss of prestige and several other things which I have mentioned in the memorandum take place.

8020. Now let me put this question to you. Where would you draw the line? If India ought to get gold from abroad, if it is a good thing that she should get gold, then I suppose a critic might say in regard to your argument: "The more gold she gets the better"; so that to carry the matter to the limiting case it would be best of all if she were to take payment for the whole of her exports in gold, which is absurd. Where do you draw the line?—The line is necessarily drawn by the exports on the one hand and on the other hand the imports of goods and the current requirements for Home remittances. Now these are the two boundary lines which must always exist and it is only the difference between the two that can be supplied in the form of gold. Now to a certain extent silver is also required for the very same purpose as I have mentioned for gold, and the difference will be made up and must be made up by gold. Either you would keep that gold outside India or inside India. You could keep the gold outside India as trustees for India, or the Government could keep the gold in India itself. I do not know of any other method in which it could be done or whether it is desirable for the sake of winning the confidence of the people to try any other method. I suppose, Sir, that is the method of the whole world and there is no reason why any other method should be adopted for India.

8021. Do not you think it is the case that what has been happening is this. India has been exporting so much, against which she has been taking the imports of commodities and the gold which she requires; that what is called the balance of trade settled in gold has really been the measure of India's demand for the commodity gold; and that there is no reason at all to suppose that there is any unsatisfied demand for gold year after year in India. If it had required more it could have got more, couldn't it?—Well, Sir, I do not quite follow that. You say there is no unsatisfied demand.

8022. You talk about the settlement of the balance between imports and exports in gold. What is it that decides the total volume of imports against exports? Must you not reckon in gold as one commodity like any other which is taken by India in the settlement of her exports? If she required more gold she could have got more gold and fewer commodities. If she required more commodities then she would take less gold. It is difficult to see why there is any evidence of late years of any unsatisfied demand on the part of India for gold. What can have caused such an unsatisfied demand; what was there to prevent India from getting all the gold she wanted?—Well what we really want is that gold should be used in the form of coins as well. The people have been clamouring for gold currency but they have not been getting it and that is to a certain extent an unsatisfied demand.

8023. In the next paragraph you say: "Here lies another inherent defect of the gold exchange standard, as the Indian exchange standard has been designated. It depends for its successful operation not on the automatic working of the system as in the gold standard but on the judicious operation of the controlling authorities." Does that observation apply to the exchange system as it has existed in India?—Here we have explained that it depends for its successful operation not on the automatic working of the system as in the gold standard but on the judicious operation of the controlling authorities. By this we mean that if a gold exchange standard is to be successfully worked it can only be done so if the controlling authorities judiciously operate it; but that has really not happened in the case of India.

8024. If I may just take that point, your observation applies there to any gold exchange standard?—Yes.

8025. Let me put to you what has been advocated before the Commission as a perfected gold exchange standard. It would be perfected in this way; firstly, that the control of the note-issue should be transferred to a Central Bank; secondly, that the reserve, the gold standard reserve and the paper currency reserve, should be combined in one reserve under the control of the Central Bank as the currency authority; thirdly, that the Central Bank should undertake an obligation to buy and sell some medium for international payment, either gold or foreign exchange, at the gold points on a prescribed ratio between the rupee and gold, 13 and one-third or 15, or whatever it was. With a perfected gold exchange standard of that sort, would you still be of opinion that the automatic working of such a system depended upon the judicious operations of the controlling authorities?—Yes, so far as the operations are concerned, it must depend on the judicious operation.

8026. What scope would there be, then, for manipulation, when the obligation was definite, legal and precise, to buy and sell either gold for export or foreign exchange at the gold points at the prescribed ratio?—The first loophole for manipulation is that a bank may not do it to an unlimited quantity.

8027. That is perfectly correct. I will add, as I should have added in the first place, that these purchases and sales must be to an unlimited amount?—Let us see what happened in the case of India.

8028. May I preface, in view of your last observation, that we must recognise that this is a standard which has never existed in India yet?—The standard that did exist in India up to 1914 in the pre-war period was worked in that way. It was worked in a very perfunctory way.

8029. Must we not recognise that there was no such standard in India before the war, because there was no obligation to sell gold or foreign exchange?—There was no statutory obligation.

8030. It was simply a question of policy and option on the part of the Government?—There was no statutory obligation; but even if there was a statutory obligation.

8031. And also another great difference, that the reserves were in two lots instead of in one, and not related to the currency?—That was one of the difficulties; and the second difficulty was that there was no statutory obligation; but even if there be a statutory obligation, then from day to day the Bank cannot be watched as to whether it is doing it or not. The work has to be placed in the hands of either one person or a set of persons and whether he is doing it judiciously, whether he is carrying out the statute to its fullest extent or not, it does not leave a loophole; and the time taken between these operations . . .

8032. Let us follow that step by step: you suggest that the central bank might fail to discharge this obligation to buy and sell?—Yes.

8033. That is, that it might break the law?—Yes.

8034. Can you protect any system of currency against a currency authority that chooses to break the law?—Under a gold standard it would not lie in the hands of the currency authorities to break the law.

8035. A gold standard must include, as I understand, a note issue?—Yes.

8036. If there is a note issue, the maintenance of that note issue depends upon the observance of the law fixing the relation between the note issue and the reserves, does it not?—Yes.

8037. It would be equally open to a central bank to break that law, if it is going to go in for law-breaking?—A central note-issuing bank will have to publish weekly figures as to what the gold in the reserves is and that will be watched by the people, and if at any time the bank does not keep that quantity of gold in the reserves that will at once become apparent and there can be an agitation.

8038. The safeguard of any law is publicity?—Yes.

8039. Supposing somebody went to the central bank to sell gold or buy gold for export and was refused, would not that at once become public? The disappointed buyer or seller would proclaim the breach of the law from the housetops and say the bank was breaking the law and not discharging its legal obligation?—An individual person doing it and the publication of weekly figures in regard to the gold reserves—there is a good deal of difference between the two; and

then, if a gold exchange standard is to be operated, the bank has got to keep its reserves either in the form of gold in order to carry out that obligation or in the form of some foreign currency. Now, so far as the foreign currency is concerned the value of that foreign currency or the bills in which the gold reserves may be invested, those values may fluctuate; and that is another reason why a gold exchange standard cannot be so perfect as the gold standard. If it is kept in the form of gold, there is no reason why there should be a gold exchange standard instead of a gold standard. Because people may be allowed to use gold it does not follow that everybody will use gold instead of silver rupees or paper currency notes. Silver rupees are required for definite purposes and paper currency notes are required for definite purposes. All that the people want is the right to convert that currency into the form of gold.

8040. Might not a critic put this against you? Might he not say: " Yes; there is a very important reason from the point of view of economy, that with a gold exchange standard you save the cost of whatever gold there is in circulation, and with an exchange standard you can keep a smaller reserve because you have not to undertake the liability of internal convertibility?"—To a certain extent there may be some additional cost; I do not know: I regret that I cannot admit it at once, but in regard to a gold standard there will be that perfect safety. Nobody could break it. It will be in the hands of the people to get as much currency as they like.

8041. Let me follow out what is in your mind. Is it not certain that to have gold in currency is more expensive than to have tokens in currency?—So far as the tokens are concerned, if you were to have silver rupees there is a profit on coinage and that profit is set apart now in the gold standard reserve. It is quite true that recently that gold standard reserve has been invested. The people complain that the quantity of gold in the gold standard reserve should first not have been taken outside India, and secondly that having been taken outside India, it should not have been invested there.

8042. That raises one or two other questions, but we agree that there is an economy in tokens in comparison with gold circulation, which is realised in the form of a profit on coinage, and that profit is commonly carried to a reserve until the reserve is big enough?—Yes.

8043. Afterwards the profit may accrue in the form of relief to general revenues?—What, do you think, is preferable, the confidence of the people or the small profit that is derived by investment of a portion of that reserve? I should think that the confidence of the people should weigh much more with the Government and the currency authorities in this matter than the small amount of profit that may be derived. After all that profit is derived by levying a forced taxation on the people against their will. People want in the form of currency what they really consider to be the standard of value, and gold is the standard of value. To the extent that people of their own accord do not find it convenient or necessary to use gold coins, to that extent they submit to that taxation in the form of profits on coinage; but if you force people to adopt only token coins or only paper currency notes, it becomes a kind of forced taxation on the people, and therein to the mind of our committee lies the great difference; you ought to educate people to economise the use of gold for currency purposes, not force it down their throats.

8044. May it not be said that this profit made, if you please, at the expense of the people, first of all, as you rightly say, serves the purpose of accumulating a reserve on the assumption that an exchange standard is useful for national purposes, and, secondly, when the reserve is big enough it goes into general revenues in relief of other taxation? So that, in the vulgar phrase, is it not the case than what the people lose on the swings they gain on the roundabouts?—But you have got to consider the confidence of the people. So far as India is concerned they have been treated to fluctuating exchanges, to the alteration of the standard of value itself from time to time and they have lost all confidence in the currency system.

8045. You return to the point that the essential is to inspire confidence, and that in your opinion the only method of inspiring that confidence is by having gold in circulation?—Yes.

8046. Further on in that paragraph you deal with some of the notorious break-downs in currency systems during the war. But as a matter of fact did any currency system which was subjected to the strain of war manage to survive it, even though there was gold in circulation?—Firstly, India was not placed in that difficult position. At that time India's goods were very much required by the rest of the world, at least by those countries which were engaged in the war. There was no reason whatsoever why if the currency system were properly managed India should have been thrown off the equilibrium.

8047. Let me refer you in that connection to all the neutral countries of Europe, which were not obviously exposed to the impact of the war, many of which had gold currencies. As a matter of fact did not all their currencies break down to this extent, that they were involved in larger or smaller measures of inflation?—Take the case of America. So far as I know they always maintained a gold standard and their currency system never broke down.

8048. That might be arguable, but if you were to take the case of Holland, Denmark, Sweden, Norway, and Switzerland, how many of their currencies survived the war without showing similar dislocation?—Firstly, I must say that I do not know the conditions of those countries that you have mentioned. Secondly, in India what really happened, was a case of deliberate disturbance of the currency system. For example when the Babington Smith Committee reported, they said that the rupee should be valued at 2s. The rupee had always been valued at 1s. 4d. What was the necessity of doing that and valuing it at 2s.?

8049. Let me say that my mind was rather turned on this question of the actual dislocations of the war period, not the post-war period. In the last sentence of this paragraph you say the real standard of value being gold the token gold value of the rupee should not have been affected by any consideration, not even the rise in silver prices. When that rise in silver prices took place until it got very high, what in the opinion of your chamber should have been done?—We have got the minority report of Sir Dadiba Dalal in the Babington Smith Committee. He suggested certain remedies under which the rupee need not have gone off the 1s. 4d. level in spite of the rise in the price of silver; and it is an essential factor of a currency system that the standard should not be disturbed. The rupee is simply a subsidiary coin. That factor should never have been forgotten. You might as well say that simply because the price of cloth has gone up one yard should be equal to two feet instead of three.

8050. When the value of silver rose until the melting point of the rupee was passed, what measure should have been taken?—The silver coin should have been debased or some other steps could have been taken. At least that was the suggestion made by Sir Dadiba Dalal that there should be a two-rupee coin further debased. The rupee should have been treated as a subsidiary coin. Now, Sir, suppose the price of silver goes up, what would happen to shillings in England? Do you think they would go up to 19 shillings to the pound.

8051. They were in fact debased as we know. The silver content was reduced?—Yes.

8052. What in your opinion would be the social, and, indeed, the political reactions upon the Indian people of a reduction at that time, or indeed at any time, of the silver content of the rupee?—There could have been none. On the other hand, the agriculture and industries of the country would not have suffered the depression that they did as a result of the fluctuations and this upsetting would not have come into existence by changing the standard of value.

8053. I am merely trying to elicit your expert evidence from your acquaintance with the habits and customs of the uninstructed Indian public. Take the case of an up-country Indian village. What would happen in that village at any time if it gets about that the rupee has no longer so much silver in it as it used to have, or if an attempt were made to substitute some other form of coin for the rupee, under any conditions. Do you think it would go smoothly, or do you think it would cause a great disturbance to the public mind?—Now, Sir, what happens at present? The silver rupee goes into the villages and the man there buys some silver with the rupee and he finds that he can buy about 33 per cent. more than the weight of the rupee. Now, he knows at once that the rupee is an over-valued coin and if you will excuse me——

8054. I do not quite follow you. You are picturing somebody buying silver with his rupees?—They do buy silver with the rupee.

8055. And he finds he can buy more silver than there is in the rupee?—Than the weight of the rupee itself, apart from the question of how much silver there is. For 75 rupees you can buy 100 tolas of silver and he knows that the intrinsic value of the rupee coin is not the artificial value which it has got owing to certain reasons which he can't understand, which only persons versed in the science of currency can understand, but which he does not understand, and, Sir, he abuses the Government. He says that the Government is giving us coin not of its full value, they are making us use coins which are not the real value. Now, that certainly is a position which does not do much credit to the Government or inspire confidence in the people.

8056. Won't he abuse the Government even more if the Government gives him a coin which is still less in its face value than its bullion value?—But, Sir, if alongside of it they know that they can get gold whenever they want it, that there are gold coins in circulation. Now, take the case of the copper pice. Now they know that 64 pice can be converted into a silver rupee. And if they knew that 15 silver rupees can be converted into a gold coin that position would not arise?

8057. If he knows that he can get gold for his rupees he will not trouble how much silver there is in the rupee?—Simply gold is a different matter and a gold coin is a different matter. They can buy gold bullion.

8058. Now we come to paragraph 6, where you deal initially with the question of the relation between the rupee and gold. You argue that " pre-war contracts valued at 113 grains of fine gold which required the payment of Rs. 15 still require the payment of the same number of rupees but which are equivalent to about 130 grains of fine gold." What is the character of the contracts which you have in mind there which were made before the war?—Firstly, the land revenue, they are fixed in terms of rupees. Then all borrowings of the agriculturists—they are in terms of rupees.

8059. For what terms are these borrowings usually made?—You mean the rate of exchange?

8060. No, what length of time?—It is estimated that there are about 800 crores of rupees to which the agriculturists are indebted in the country.

8061. When an agriculturist borrows money in this way, for what length of time does he borrow it?—It goes on from year to year and the poor agriculturist is always indebted and the loan continues and they cannot get rid of their indebtedness.

8062. But it is formally repayable at any time?—There are two kinds of contracts. One is mortgage and the other is ordinary loans.

8063. For what period are mortgages usually made?—In debentures the periods are long.

8064. Yes, in higher finance, in bigger trade?—Yes, Sir. So far the agriculturists are concerned, the period mentioned in the mortgage is not long but a mortgage is allowed to continue for a long period.

8065. What is the normal period for a debenture to be repayable?—There are several kinds of debentures, 10 years, 20 years. There may be longer terms.

8066. Is ten years the usual minimum period?—I should not say that but the debentures continue longer and they have to continue on the same basis.

8067. The ordinary loans are, as you say, repayable at any time, but the borrower may not have the money with which to repay?—Yes, Sir. They go on continuing that loan in that way on the same terms. I have mentioned the large amount of preference shares on which the dividend is paid at a fixed basis.

8068. They are all fixed investments, no doubt. Then further down you say: " In other words, all debtors have now to give 130 grains of fine gold to discharge their existing contracts instead of 113 grains for which they really contracted." Should we limit that by saying " all debtors on these long term contracts "? You do not mean absolutely all debtors, do you?—We mean all debtors who have continuing obligations. Debts that have already been discharged don't come into consideration but all the contracts which have not been discharged continue on that basis.

8069. Can you give the Commission any guidance as to the relative volume of interest involved in contracts entered into on the 15 to 1 basis and still continuing, and contracts for a shorter term which have been entered into upon ratios of the rupee to gold which prevailed since the 15 to 1 ratio?—You mean, Sir, all short term contracts relating to.

8070. The relative volume of interest involved in the short term contracts and these long term contracts?—Well, so far as short term contracts are concerned, those that have been discharged are discharged. And the land revenue, debentures, preference shares, and mortgages, all these contracts are continuing, they are continuing while the short term contracts have been discharged and gone off. The term in a certain contract may be a short term but if it is continuing it comes under this.

8071. Nevertheless, under these conditions the debtor has his remedy, has he not, and that is to repay the loan?—He must have the money to repay it. If his buying power disappears, if he gets less money, then his capacity to repay the loan gets reduced still more.

8072. I will come to the question of his capacity in a moment, if I may. As a matter of fact, is not the vast bulk of contracts entered into from day to day in any country contracts for purchase and sale, and are not such contracts typically short term contracts which either exhaust themselves on the spot by the passage of cash or exhaust themselves within a period of, say, at most three months on the discharge of the bill or some such security?—I don't quite follow how that would affect the position.

8073. I am trying to see the difference in the volume of interest involved in long term contracts and short term contracts, and the suggestion may be put that by far the largest volume of interest involved in contracts made from day to day are those involved in contracts for purchase and sale?—How would that affect the situation at all? For example, if a man has entered into a contract, he covers his exchange.

8074. I think that is a question to which a simple answer is really the most informative. Is not that, as a matter of fact, a feature of commercial life, that the great volume of contracts entered in from day to day are contracts to buy and sell some commodity?—But, Sir, they cannot affect the postion so far as currency is concerned? They are self-liquidating contracts, where a person buys and sells on the same basis. Unless a person holds goods as a speculator, which is a different matter, they are all practically self-liquidating contracts. If I am an exporter I buy jute on the one hand in India and sell the jute in England or Scotland or Germany or America at the same time. Therefore, they are always covered, one against the other. Now, so far as the long term contracts are concerned, they are really continuing

contracts whose position is really affected. Contracts that are covered one against the other, their expenditure may be very large but they are really not affected. For example, Sir, if a banker buys bills he also sells bills against it. He does not lose or gain. Similarly, an importer, if he buys goods from Manchester say or any other other place, he also buys sterling bills, he enters into contracts for sterling against it. So they always cover one against the other.

8075. The final question on this point is, when we are considering the volume of interests affected by the different ratios, can you give us any guidance as to the relative volume of these long term contracts now outstanding entered into at the ratio of 1 to 15 and those entered into at the various ratios which have been in force since the departure from the ratio of 1 to 15?—No, Sir, there can really be no comparison at all until all the agriculturists, who constitute more than 75 per cent. of the population, are affected in this way. Supposing an agriculturist produces goods. He has got to sell that on the basis of the existing high rate of exchange. But all his obligations have been defined in terms of rupees so that the whole of that population is affected by the high rate of exchange. Then, Sir, take the case of the manufacturing industries. Their case is exactly similar. Their fixed obligations are fixed in terms of rupees, but they have got to sell their products on the basis of a high rate of exchange, that is 12½ per cent. lower. Similarly with the coal mines; the miners' fixed obligations are in terms of rupees, their wages and everything, but they can sell their products only on the basis of a high rate of exchange that is lower in terms of rupees, so that what may be called the margin gets reduced in the case of the producers without any exception.

8076. As regards the position of the producer, what would be your opinion on this consideration, that owing to the fact that the rupee now stands at 1s. 6d. he will be getting less for what he sells than he did when tho rupee was at 1s. 4d., but, on the other hand, he will be paying less for what he buys, and so he is no worse off than he was before?—He *is* worse off. Let us take the case of coal, coal going from Jharia to Delhi. Now if coal sold at Rs. 6 at Jharia and the railway freight was Rs. 9-10, the cost to the consumer would be Rs. 15-10. The Delhi consumer who is selling his products lower also wants to buy his coal cheaper by 12½ per cent. Now reducing by 12½ per cent. from 15-10, it comes to Rs. 13-10. The railway freight remains the same, Rs. 9-10, so that the colliery, instead of getting Rs. 6, gets Rs. 4 only. As against that, he has lost Rs. 2. The colliery at the same time has got to pay a certain amount of rupees in wages. Now, I got figures from the Indian Mining Federation, and they said that a colliery was raising 2,500 tons of coal per month. Out of Rs. 4-10, their raising cost, Rs. 4 represented wages which were fixed on the basis of rupees. They had to pay the same amount of wages, and that is the reason why simply on account of exchange being at 1s. 6d. they cannot make any profit; their wages are the same, the railway freight is the same, their fixed obligations on their loans are the same, and ultimately they get so much less.

8077. On the other hand, we have had it in evidence that there have been in fact reductions in railway freights; I rather think that coal was one of the actual freights specified. What would be your opinion on this contention received in evidence that there is a constant tendency of late years for wages, for instance in the coal mines in India, to rise, and that the effect of the rise in the rupee has been, if not obvious in the reduction of wages, at any rate to prevent what would otherwise have been a further rise?—Now, Sir, a rise in wages can only take place when the mill or the mine concerned makes profits.

8078. Is that so? That is not the experience of less fortunate countries?—I do not know what happens elsewhere, but in India the labourers claim an increase in wages when they find that the owner of a mine or a mill makes profits. Then they agitate for it. But once the wages increase, if you try to decrease them, there is much agitation as we have recently seen in Bombay. Wages rose when the cotton mills were making extensive profits, but when as the result of losses they tried to decrease the wages, there was a strike and there was so much confusion. Similarly at any other place if wages are sought to be reduced there would be strikes, there would be an upsetting of the whole economic system so far as that branch of the trade is concerned, and it would lead to liquidations, bankruptcies, and so in the process of the adjustment to a higher level of exchange we shall have to pass through so much confusion and so much depression;—and then Government has not shown any alacrity to reduce land revenue or anything so far as the agriculturist is concerned.

8079. I will return to that on a later point of your memorandum. Then you say in paragraph 11, "there should be an obligation to give gold in return for paper notes or silver rupees. It is certain that after convertibility has been maintained for some time, the people will of their own accord adopt a habit the result of which will be to dispense with the actual use of gold for internal circulation. It would not therefore be a difficult matter to maintain the convertibility of the rupee eventually if it can be done in the initial stage of the adoption of a gold standard. In fact, having regard to the large volume of rupee coins and notes that will always be in circulation, convertibility of the rupee will have to be a permanent feature of the monetary system." That you expand further on in your memorandum. Then in paragraph 12 you pronounce a considered opinion against a managed currency upon the lines advocated in certain quarters, and in paragraph 14 you return to the question of the ratio?—Might I be allowed to correct a printed mistake in paragraph 13. "15·4d." ought to be 1s. 4d., in line **six**.

8080. That may be corrected on the proof. Then you say in paragraph 14: "On the other hand, Government continued their programme of contraction—at least of keeping the country starved of currency—with a view to push exchange to a high level." It has been suggested that the Government has intervened of late to keep exchange from rising above 18d. Have you any opinion on that?—I am rather surprised to hear that. What really happened was that the 2s. rate was put on the Statute Book. As a result of it no gold could be tendered to the Government and there could be no expansion of currency. Even the Bengal Chamber of Commerce had to protest against it about a year or two ago. What the Government did was that to a certain extent they purchased sterling bills and issued currency against it, but they did not do it to the fullest extent. They did it to a certain extent to keep exchange at 1s. 6d. They did not go further and give more currency than was required to keep exchange at the pre-war level of 1s. 4d.

8081. Apparently that statement does need to be supplemented by the consideration that of late the Government has taken certain measures to keep exchange down to 1s. 6d.?—We read it in the other way. The fact was that the Government prevented an automatic expansion of the currency, and after that to a certain extent issued currency by the purchase of sterling bills, but they did not do so to a complete extent; they kept the country starved of currency. In that case exchange would have gone up.

8082. In your opinion if the Government had not intervened the exchange would have fallen naturally to 1s. 4d.?—But, Sir, Government ought to have kept the proper rate on the Statute Book to enable the country to deliver gold to Government and obtain Indian currency against it. You cannot block the door against the issue of fresh currency and then say that instead of Rs. 10 we have given you Rs. 5 and be satisfied with the Rs. 15 on the principle that half a loaf is better than none.

8083. The immediate question is what would have happened to the exchange if Government had not intervened: would it have risen above 1s. 6d. or would it have fallen?—If Government had accepted Sir Purshotamdas Thakurdas' Bill and put 1s. 4d. on the Statute Book, people would have tendered gold to the Government and got Indian currency, and it is our firm conviction that exchange to-day would have been ruling at 1s. 4d. instead of at 1s. 6d.

8084. Undoubtedly, by taking appropriate measures the Government could have reduced the rate to 1s. 4d., but do you agree or do you not agree that, but for the active intervention of the Government to reduce the rate, the rate would have risen above 1s. 6d.?—If the Government does not issue any currency, if the country has got to do with whatever currency it has got, and the amount of currency to meet development is not issued, well, exchange might have gone up to 1s. 8d. or 2s. But that is what the people are clamouring against, and that door should not have been blocked by putting the 2s. rate on the Statute Book.

8085. Then you say that "even therefore leaving out of account Government manipulations, 1s. 6d. cannot be thought of as a natural ratio." Could you explain what you mean by a natural ratio in this connection?—What we mean is that we have seen four good monsoons. Now in spite of that the buying power of the country has got very much reduced, and then if there is a bad monsoon and then if there be further operations of the Government, and we do not know which side it would be, then the exchange may be again disturbed. It cannot be said that exchange is stabilized, or that matters have adjusted themselves to 1s. 6d. It is simply artificial, it is not the result of natural forces working.

8086. On what evidence do you base the conclusion that things have not adjusted themselves to 1s. 6d.?—The railway freight has not been adjusted, wages have not been adjusted, interest is not adjusted—nothing has been done at present, there are all these obligations, on the old basis.

8087. Recognizing that interest on long-term securities and so on does not adjust itself, on what evidence do you base the conclusion that prices in general have not adjusted themselves to the 18d. rate?—The question of prices adjusting themselves cannot arise because the prices must be governed by the world prices firstly, and secondly by the rate of exchange. Now if £1 be the price of a certain quantity of wheat and if exchange be at 1s. 6d. the price in India will be at Rs. 13-5-4. If exchange was at 1s. 4d., the price would be Rs. 15. There can be no question of prices adjusting themselves. It is these obligations which have to adjust themselves in order to bring to the producers the same margin as they would otherwise get.

8088. I gather then that, in your opinion, there can be no question of prices adjusting themselves in the sense that they must adjust themselves?—Prices must be ruled day to day by world prices and the rate of exchange.

8089. So that if the rate of exchange changes from whatever rate is current on a given day, then prices must adjust themselves to the fresh rate?—Yes.

8090. At the beginning of paragraph 16 you say: "Apprehensions are often expressed that if gold coins are allowed to circulate in this country there will be a great scramble for gold in the world market, that commodity prices would fall and trade and industries in the world would suffer. The Committee cannot, in this connection, conceal their feelings of resentment that such a question should be raised in the case of India alone. India must have the right of her economic self-determination. Does your Chamber consider that the possibility of a sharp change in world gold prices as the result of any additional demand for gold for India is a matter which has no concern from the point of view of Indian interests?—Firstly, they think that there cannot be a great scramble for gold; secondly, we think that if India gets more gold, the other countries also would adjust themselves on the same basis and India will follow other countries in the world. We do not see how there could be a great economic disturbance simply by reason of the fact of India adopting a gold standard.

8091. Let us take it in two steps. Assuming, for the purposes of our discussion, that there were such a disturbance in world gold prices, that would, would it not, be a matter which would affect Indian interests?—We would like to follow the world in that respect.

8092. Supposing it is a case of India creating the disturbance by her additional demand for gold?—I do not see how India would create the disturbance. As I have already stated, India has never taken even one-fifth of the world production of gold which her population would justify and therefore, this cannot be said against India that India is creating any disturbance.

8093. In this question I am asking you to make the assumption that the demand for additional gold resulting from the adoption of this currency policy did create a disturbance to world gold prices. That is the assumption?—How can I make the assumption; I cannot believe in it.

8094. You will not even make it for the purposes of discussion?—No. Sir.

8095. You are quite entitled not to make it, but I should like to put the question just to bring out all possible bearings. Supposing one were to make that assumption, then it would become a matter for consideration from the point of view purely of Indian interests as to whether the policy was in the interests of India or not?—Sir, my committee are so strong on this question that you might as well ask me to assume that I am not sitting in this room. My committee do not think that there will be any such contingency arising.

8096. I understand that in your reply you are basing yourself upon the opinion expressed in paragraph 17 that India has already enough gold in her reserves to immediately undertake the obligations of this policy?—Yes; we think that our reserves are very strong and you can introduce gold standard and gold currency on the strength of the reserves that we have got.

8097. What would be your reply to this possible contention of a critic? The gold which India now holds in her reserves is that amount which experience has shown to be no more than is necessary in order to fulfil the function of maintaining the exchange value of the rupee. If to that liability is added the further liability of redeeming the rupee currency in gold, that will of necessity imply the accumulation of an addition to the present gold reserves? Do you follow that question?—I quite follow that question.

8098. The point is this, that at present against these assets of gold, you have a corresponding liability for maintaining the exchange value of the rupee, and the assets are fully pledged against that liability. If you are going to undertake the fresh liability of the internal conversion of the rupee into gold, you must need more gold in the reserve?—Now, Sir, let us understand each other perfectly well. Do you think that there is going to be a large rush for gold coins in exchange for the silver rupees that are already in circulation? If that be so, Sir, my committee is very strongly of opinion that such an assumption or such an apprehension would be very much ill-founded. Now what is after all the volume of currency in circulation? It is at best 300 crores of silver rupees and 190 crores of paper currency notes. Now we have got about 685,000 villages in India, over 2,000 towns and more than 2,000 crores of rupees worth of crops to serve 32 crores of people, inadequate banking facilities, no sufficient facilities for the encashment of these notes and exchange of silver rupees and paper currency notes. All these things have got to be done in terms of notes and silver rupees. In what circumstances can there be a great rush on the existing reserves for conversion into gold coins? Now we have

here to draw a distinction between the issue of fresh currency and a rush for conversion of the existing rupees and notes in circulation into gold coins. Now you cannot think that the people of India would one day sit in conspiracy and decide not to eat or drink or do any business and come to Calcutta and Bombay to get their silver rupees and paper currency notes exchanged into gold coins. Now the paper currency notes serve a distinct purpose. They are mostly dealt with by banks and the bigger merchants and serve also the purpose of transmission from one place to another. The silver rupees are required for the smaller transactions and the 32 crores of people in India have got to use the silver rupees for their smaller transactions. After all how much does it work up to? It does not amount to Rs. 10 per head of the population. That is a very small amount and we cannot think of any circumstances in which there could be a rush for the conversion of those silver rupees of paper currency notes into gold coins. Why should the people do it? Can they stop their dealings? Can they stop their business and stop everything in order to carry out their fancy of having gold coins? They must go on carrying on their business in the usual way. They must carry on their dealings.

8099. I understand it is the opinion of your Chamber that, as far as the rupees and notes required for circulation are concerned, there is no apprehension that there will be any demand for their conversion into the bigger unit of currency, the gold unit?—Yes.

8100. In the first place, is that quite certain? In view of the desirability of the more valuable medium of circulation, gold, particularly after a period during which gold has not been available for that purpose, is it quite certain that you would not have people presenting notes for conversion into gold in order to touch the more precious medium?—What happens is, always fresh currency is required from year to year. Now if Government will say that they will issue fresh currency against delivery of gold, fresh gold would come to the Government and in exchange for that some gold coins would go into circulation. But for the purpose of mere conversion, for the sake of fancy of having gold coins, we do not think that people will send their silver rupees or paper currency from the interior to Calcutta or Bombay. So far as the fresh currency is concerned, i.e., new issues, that will be issued against the delivery of gold to Government.

8101. Would it be wise for any responsible authority to undertake the obligation to convert rupees and notes in circulation into gold without making provision against the possibility of an additional demand for the conversion of the outstanding medium of circulation?—So far as my committee is concerned, they do not think there is any such apprehension.

8102. I understand you think that is a risk which is quite inconsiderable?—Yes.

8103. In the second place, as regards the outstanding rupees, must one not distinguish between two classes, those which are in active circulation and those which are held by various holders as stores of value in what are commonly called hoards?—Silver rupees in hoards?

8104. Yes?—I do not think there are any silver rupees in hoards. Who would hoard them? First of all there are the agriculturists who consist of 75 per cent. of the population. Far from hoarding, whenever they have to meet expenses of even Re. 1 or Rs. 2, they go to the village sowcar and borrow money. They have to borrow money in order to meet their day to day wants. So far as the merchants are concerned, they are much too clever for hoarding silver rupees and I do not know which other class of people would hoard and why should they hoard silver rupees which are so much over-valued? And the amount of currency in circulation, 300 crores of rupees, is so small as to exclude any possibility of hoards. We do not think, Sir, that there is any such thing as hoard of silver rupees in India. I do not know if the Government has got testimony of it and it will be of much interest to know what evidence Government has got of there being hoards of silver.

8105. It is suggested, for instance, that there are very large hoards of silver rupees held by certain Native States. Have you any information on that subject?—We have heard of the Nizam having certain hoards; but so far as these are concerned, either they want to convert them into gold or they do not. If they want to convert them into gold, they must have done so when gold has been so cheap, at Rs. 21 or thereabouts, instead of waiting for higher prices or for gold to come in. If they want to keep them in the form of silver rupees, there is no reason for those silver rupees coming out in rush and being converted into gold coin. The Native States, if they have hoards of some silver rupees, they must be in the same way as the paper currency reserve in British India has got some silver rupees in the reserve. They would continue them in the form of silver rupees but if they wanted at any time to change them into gold they have had this cheap gold for a long time and they must have converted it.

8106. It is the proposal of your Chamber in paragraph 23 that, "after convertibility has been declared, the rupee may be made a legal tender within a limit of Rs. 1,000 only." If the rupee is to cease to be full legal tender, would not that constitute a very strong motive for any holder of rupees in hoards to convert them into gold?—No, Sir. So far as this Rs. 1,000 is concerned we have placed this limit in view of the fact that all dealings which are carried on in silver rupees would be carried on in silver rupees if a limit of Rs. 1,000 is placed; and so far as hoards are concerned, I have already explained to you, Sir, that anybody who wanted to convert those hoards into gold—we do not think that any such hoards exist to any large extent, at least the people of British India have not got them; but if the Native States have any hoards worth consideration and if they wanted to convert them into gold they must either have done it or they would not do it.

8107. Suppose that I am the holder of a large rupee hoard. As you say, I might have converted my hoard in the open market. I did not do so. Now I see an announcement that the rupee is to cease to be full legal tender. Would not that constitute a very strong new motive in my mind for the conversion of my rupee hoard into gold?—What would be the change in the circumstances then? Now let us assume for the sake of this discussion that some Native State has got 50 lakhs of silver rupees. I do not think they have, but let us assume it. Did they at any time expect to carry those 50 lakhs on the backs of their camels in order to purchase things? No, they only held them in order that they could utilise them for the purposes of their people's small dealings; otherwise there would be no point in any hoards, nor have we evidence of any such hoards.

8108. Why do you say that they are only held for the purpose of small payments? Would it not be more natural to assume that when a large hoard is held it is held with the ultimate intention of making payments, including big payments?—I should very much enjoy the sight of a Native Chief coming to Calcutta with a lakh of silver rupees on the backs of camels going to Hamilton's and paying a lakh in cash or silver rupees for his purchases.

8109. Perhaps if we paint the picture in a more probable way of the rupees arriving in a motor-car it is not so unnatural?—Even with a motor-car, just consider the weight of 50,000 or a lakh of rupees.

8110. Seriously, would it not very much affect the value of a large hoard as a store of value if the coins of which that hoard is composed were to cease to be full legal tender?—I do not understand how there could be any change in the position. They do not require it for large payments specially in the Native States. They know that those large payments can be made either by cheques or in Rs. 2,000 or Rs. 3,000 currency notes. They know how to deal with banks. They have banking accounts and they can never

expect to use silver rupees for the purpose of making large payments.

8111. Finally in this connection as regards the existence of these hoards, would it surprise you to learn that competent authorities estimate the total amount in rupees held in hoards as a store of value as something between 100 and 150 crores?—Sir, I have no hesitation in saying that that estimate can never be correct. I am quite surprised to learn that the dealings of 32 crores of people in 7 lakhs of villages and over 2,000 towns are carried on by means of 150 crores of silver rupees only. The crops are valued by Mr. Findlay Shirras at over 2,000 crores of rupees per year, and without banking facilities in this country, without cheques being there, it would be very surprising indeed if all these dealings were carried on with the help of 150 crores of rupees only.

8112. One last question dealing with the ratio. In paragraph 21 you say: "It is completely within the powers of the Government to reach back to the 1s. 4d. figure; all that would be necessary is a further process of expansion." What in your opinion would be the effect of that process of expansion upon prices and the cost of living in the country?—So far as the cost of living is concerned, for some time to come they would continue on the present level; and as regards higher prices, surely the lower prices that they have maintained as a result of 1s. 6d. as I have already submitted to you, Sir, have produced a great depression in the country as a result of which the buying power of the people has been reduced and economic development cannot take place because there is so much depression. Now that depression will cease to exist as the result of this expansion.

8113. Then in the old argument, Mr. Khaitan, if that be so, why stop at 1s. 4d.? Why not, if it is so beneficial to the country to reduce it to 1s. 4d., reduce it to 1s. 2d. or a shilling?—Now just as we require 1s. 4d. in order not to do injustice to the debtors, so we cannot require 1s. 2d. in order that injustice may not be done to the creditors. People have worked on the basis of 1s. 4d. I could understand that argument if it was put to me in the year 1893 when 1s. 4d. was decided on. At that time it was desirable to fix it at 1s. 2d. but I do not want to go into all that question; it happened about 27 years ago. Since then people have always been working on the basis of 1s. 4d. and that is the proper way to do justice as between the creditor and the debtor, as between the producer and the consumer—in fact, all dealings in the country have been adjusted on that basis so that if you leave that figure either making it higher or making it lower, one class of people will be done injustice to.

8114. I understand you assume in your reply that the relations between debtor and creditor in the country are still based on the 1s. 4d. ratio?—Yes, Sir; all dealings are based on that basis.

8115. All their relations are adjusted to that basis? —Yes, Sir.

8116. Now may I ask you to be so kind as to answer any supplementary questions which any of my colleagues may have to ask?—Certainly.

8117. (*Sir Rajendranath Mookerjee.*) Is not the rise of wages in the case of labourers directly due to the rise in the price of commodities?—The rise in wages chiefly takes place when the concern in which the labourers work is making profit; if they find that the concern is making profit they demand more wages. Now you had that experience in your collieries; Sir Alexander Murray has had that experience in his jute mills; Sir Purshotamdas Thakurdas has had that experience in his cotton mills. It always happens like that. When prices go down the wages cannot be reduced; it is very difficult to reduce wages. On the other hand when prices go up there will be a certain demand, but unless they find that the concern in which they are employed is making profits the wages cannot be increased because the concern cannot afford it.

8118. You are referring to skilled labour; I mean the ordinary labourer.—I am referring to both skilled and unskilled labour.

8119. But they do not really understand whether the concern is making profit or not.—They do keep up enquiries and they are advised by people who are aware of these facts.

8120. Let me tell you of one case out of many. The labourers in our iron works threatened to strike unless they got an increase of wages. When asked about the reasons they said "the cost of the necessaries of life have gone up so high that we cannot live on the wages we are getting." On that I opened shops in which the prices were fixed for selling rice, dhal, ata, ghee, etc., everything they wanted to be sold to them at the same prices at which they used to get their supplies before. My object was to help them till prices came down, and they were all satisfied with the shops which supplied them these necessaries at fixed prices. It meant a loss to us but that loss was only for a time?—May I further enquire in which year that took place?

8121. Two or three years ago?—When there was all that confusion going on, the rise in price and the rise in wages.

8122. There was political agitation no doubt?—Yes.

8123. That is always the case, as far as my experience goes of collieries, that as long as they can meet the demand for necessaries on their wages they are satisfied, and only when they cannot meet it that they ask higher wages?—But you yourself admitted that political agitation was also going on at that time; so far as that particular case is concerned that may be explained better by political agitation than by anything else.

8124. I come to another point. Is not the rise in prices of commodities due to a fall in exchange?—I have said so. If exchange rises or falls the price of commodities would rise or fall with it, as regards those commodities which enter the world trade.

8125. Those are the exports?—Both exports and imports.

8126. About the rise in the prices of exported commodities, does not that react upon other commodities whoch are not exported?—Gradually, Sir, yes but it takes some time.

8127. Therefore is the rise of exchange beneficial to the labourer or is the fall in exchange beneficial to the labourer?—The labourer who gets his fixed wages in terms of rupees?

8128. Yes?—If his wages are fixed on a certain basis, say on the basis of 1s. 4d. then if you make the exchange 1s. 6d. the concern in which that labourer is employed loses and the labourer has not earned that increase in wages which automatically comes to him as a result of the rise in exchange. You must do justice to both. If the concern in which he is employed does not make a profit there will be no concern to employ him in. You must look to both.

8129. I am afraid they are not as logical as you are?—They are not, but the Currency Commission ought to be logical.

8130. But say a man gets 8 annas in daily wages; if he finds that he can with that 8 annas buy all the necessary commodities he is satisfied with it; but if he finds prices are going up higher and he cannot buy these necessaries for his family then he clamours for more. Is not that a natural fact?—It does not come all of a sudden. What happens is if all prices rise then the concern also makes profits. Then they get two things to advance: the concern is making profits and our expenses have gone up. They then make a demand and the concern is in a position to give them an increase in wages. Wages have to adjust themselves from time to time; there is no doubt about it; but if you put to me that all of a sudden the demand comes in at the slightest disturbance in the rates of things, for example if the price of rice to-day is 4s. and the next day 4s. 4d., I do not think

your labourers will come to you and ask for an increment in wages of one anna in the rupee.

8131. It may take 6 months?—Nor when things are cheaper would they come to you and say "We are getting things cheaper; you had better reduce our wages."

8132. That is against human nature. Even you with your high pay wouldn't do that. My point is that the labourers to-day claim higher wages when they are in difficulties, that is, when they cannot meet the necessaries of life. That is the guiding factor in the whole labour problem, at least in India?—It would be so all over the world.

8133. I would like you to explain it a little more in detail whether the rise of exchange affects them beneficially or otherwise?—They get an unearned increment simply as the result of the rise in exchange. By that I mean that if you fix wages on a basis of 1s. 4d. and if exchange thereafter goes up to 1s. 6d. they automatically get an unearned increment or an ungranted increment of 12½ per cent.

8134. (*Sir Alexander Murray.*) Mr. Khaitan, you referred to the increases of wages given in the coal trade and in the jute trade: can you recollect what were the actual increases given during the war period?—In the jute mills it was perhaps 50 per cent.

8135. And in the coal trade?—About 25 per cent.

8136. And what did you give in the cotton trade here?—Here we have got to follow the jute mills.

8137. There we will assume that in the cotton trade here you gave 50 per cent.?—Yes.

8138. If we were to tell you that over in Bombay the increase of wages was something like 130 per cent.?—Yes, I have heard that.

8139. Would you think that the people here got too little or the people in Bombay got too much?—I should think that what really happened was that before the wages were increased in Bombay the labourers in Bombay were getting correspondingly less than the jute mills here were paying. I have not compared those figures; what might have happened was that the jute mill labourers were paid better, because jute mills were making better profits. I cannot say; I have not looked into those figures and therefore I cannot give you a definite opinion.

8140. Well, when we increased the rates of wages in the jute trade and also in the cotton trade on this side of India, the increases were given with relation to the cost of living?—Yes.

8141. At the present moment you say the increase in the jute and cotton trade on the Calcutta side is about 50 per cent.; that is to say, the figure has risen from 100 to 150. Now, the cost of living here according to the statistics at our disposal in the Labour Gazette, has only gone up from 100 to 153: so that the increase of wages, and the increase in the cost of living have kept in line with each other. Taking also the index numbers of wholesale prices in India, the index shows that taking 100 as the pre-war index figure, the figure to-day is 158: so that we have the wages given in the jute and cotton mills here, the cost of living, and the wholesale prices in India all practically at the same level?—What was the index number one year ago and two years ago?

8142. The next number was 181 a year ago?—And two years ago?

8143. It was also 181 two years ago. I am asking you questions, not you me?—It is not with a view to ask any questions, but simply because you had the book in your hand and the reason why I asked that question was this: when wages were increased they were increased to a certain figure on a certain basis the cost of living compared to 1914 had perhaps gone up still higher than 50 per cent., but wages were increased by 50 per cent. only. The labourers were satisfied with that increase to the extent of 50 per cent. When the cost of living has gone down from 180 or perhaps from a still higher figure to 150, the wages have remained the same.

8144. I am dealing just now with the pre-war days; you had exchange then at 1s. 4d. To-day you have got exchange at 1s. 6d. I am taking the index number of 100 for the pre-war days which you want to go back to with exchange at 1s. 4d.; and I am taking the present position with exchange at 1s. 6d. and I am showing you that wages have gone up roughly 50 per cent., the cost of living has gone up roughly 50 per cent. and wholesale prices have gone up roughly 50 per cent. It is the same also in the United Kingdom and in the United States of America which are gold standard or gold exchange standard countries. Now, do you not think that that points to the fact that this is a suitable opportunity for stabilising exchange because given a gold standard where gold prices will fluctuate with prices in other countries, you have, as I say, all the factors that go to make an equilibrium at the present moment? You have got the United States round about 150; you have got the United Kingdom round about 150; you have got India round about 150, with wholesale prices, wages and cost of living also in keeping so far as this side of India is concerned. Do you not think that speaking as a practical man that all points to the fact that exchange at 1s. 6d. is a state of affairs that ought to be as far as possible maintained?—I cannot agree with you in that, because matters in India have not yet adjusted themselves to 1s. 6d. They have still to adjust themselves, and if this rate of 1s. 6d. is continued, you will find further depressions, and if you are under the impression that matters have adjusted themselves in India on the basis of 18d. I can only say that I regret I cannot agree with you.

8145. I am giving you figures regarding the industries with which you and I are familiar, namely, cotton on this side of India, jute and coal; and I have pointed to the fact that all these index numbers are more or less in keeping with each other, including wholesale prices in America and in the United Kingdom. Does it not therefore seem to be an appropriate time for stabilising exchange at 1s. 6d.?—I cannot agree with you, because I do not think matters have adjusted themselves on that basis yet; and if this rate of exchange is continued there will be further depressions.

8146. But what more should adjust itself as between 1914 and 1925 or 1926 than wages, wholesale prices and cost of living? What more do you want to adjust itself?—These prices have not yet adjusted themselves; the railway freight has not adjusted itself; interest has not adjusted itself.

8147. I am giving you figures to show what the wages and cost of living and wholesale prices are?—So far as the cost of living is concerned, you cannot say it has adjusted itself to the basis of 18d. yet.

8148. Why?—Because it is still in the process of transformation or whatever you may call it; it is still in that process. Nothing has adjusted itself yet on this basis.

8149. What more will have to be done to complete the adjustment?—The railway freights and interest have got to be adjusted; land revenue has got to be adjusted; all these adjustments have yet to take place.

8150. But we are dealing with the workers in mills and the cost of living?—Could you think simply of the worker alone?

8151. Excuse me, it was you that raised the point to Sir Rajendranath Mookerjee, not me: I am only dealing with a point raised by yourself?—If you will excuse me, it was Sir Rajendranath Mookerjee who put to me the question of wages: I did not raise that question. But I am proceeding more on the basis of the point of view of producers than on that of the workers alone. The workers constitute a very small percentage of the number of agriculturists and other producers in the country.

8152. Let us take the producers: which producers in particular are you thinking of?—Firstly, the agriculturist; secondly the small industrial people; thirdly, the bigger industries and fourthly the mining people.

8153. As regards the agriculturist also, the index number of wholesale prices in India is 157 and that is the level ruling in the United Kingdom and also in

the United States?—As regards this 150 that you mentioned here for the wholesale index figure, that simply represents the prices that are ruling at the present moment on the basis of the world prices in terms of gold and on the basis of the rate of exchange that prevails. But that agriculturist has got to bear the same amount of land revenue as was fixed on the 16d. basis; he has got to pay the same amount of interest in terms of rupees to his mahajan on the basis of 16d. His commodities when carried from the fields to the place of export have got to pay the same amount of railway freight as was fixed on that basis. All this he has got to pay in terms of rupees at a constant figure. If 16d. had been the rate of exchange he would have got 12½ per cent. more and the result would be that the margin left to him would have been much more than 12½ per cent. on tho basis of 16d. than at 18d. Now, it is really the agriculturists who constitute the country's strength. It is the mills and factories, big and small, and the mines that really produce wealth and sustain the country; whether they be skilled or unskilled labourers, or whether they be lawyers or doctors, or whether they carry on any profession—if you hit the producers of wealth the result is that the buying power in the country gets reduced; if they have no margin they will not have the resources from which to make the payments as a result of which either the factories can make profits or the professional people could earn money or anything can be done.

8154. But the producer gets his income from his crops. He is getting an income from the crops that is quite in keeping with the prices that have to be paid for all these other things that I have been telling you about?—He would get still more if exchange were at 16d.

8155. He is getting an increase now in food prices of 50 per cent., which is in keeping with all the other increases that we have been referring to. What more ought he to get? I am giving you actual facts; you are only surmising that if exchange were at a different rate he would be gitting different prices; but the fact remains that he is getting on a basis of 150 as against 100 in pre-war days; therefore all these things point to the fact that this is suitable opportunity for stabilising under existing conditions. You say that if exchange were to be altered on a 16d. rupee basis he will get more, but it does not necessarily follow?—It must necessarily follow; take the case of wheat which also enters into the export trade. Now, the price of wheat is fixed in the world on the basis of gold. Telegrams go from Calcutta, Bombay and Karachi into the interior and the merchant in the interior who has to pay the cultivator finds he can pay on the basis of the telegrams that he receives from Calcutta, Bombay or Karachi. Calcutta, Bombay and Karachi calculate the rupee rate on the basis of the exchange rate prevailing. If it is 1s. 4d. then he calculates at the rate of Rs. 15 to the £. If it is 18d. then he calculates at the rate of Rs. 13-5-4 to the £. If he could calculate it on the basis of 16d. then he could have paid to tho cultivator 12½ per cent. more than the cultivator now gets on the basis of 18d. I do not think there could be any case of surmise in this.

8156. There is only a very small proportion of the wheat crop exported compared to what is consumed up-country?—It may be a small percentage. Now that is a further argument, the small percentage that you mention of the export. Now, while only a small quantity is exported, the cultivator here gets less money on the whole at his credit. Because he can't get Rs. 13 on the quantity that is exported and Rs. 15 on the quantity that is consumed in the country. Throughout he gets the smaller price that is reached by reason of the higher rate of exchange prevailing.

8157. And you say the 5 per cent. or 10 per cent. of the crop that has been exported will therefore rule the price for the whole of the crop in India?—Sir, it must be so. It cannot be that 10 maunds of wheat will be sold at Rs. 13 and 9 maunds at Rs. 15.

8158. But a great deal of the wheat is consumed without being bought and sold, so to speak. Therefore, the great majority of the agriculturists in this country simply grow sufficient for their own requirements and there is very little surplus for sale?—Sir, have you got any evidence of that? On the other hand, my experience is that oftentimes the cultivators grow certain things and they consume other things. For example, the cultivator that grows cotton does not eat cotton; he sells his cotton.

8159. It is no use going to cotton; we were discussing wheat. We won't pursue that. One other thing. I see in your statement, here, in paragraph 6 you say: "In dealing with and talking of, and entering into obligations in terms of rupee in the pre-war period, people did so as if they were dealing with, talking of and entering into obligations in terms of 7·5334 grains of fine gold." Then in paragraph 8 you make the statement: "That gold is really the standard of value, that rupee is really a token coin intrinsically only $\frac{11}{16}$ worth of its currency value, that it is, in effect, a subsidiary coin, are hardly realised by the public." You go on to say: "It is little surprising, therefore, that public are not often alive to the fact that the Indian currency system rests ultimately on a gold basis." On the one hand you tell us that everybody, including ryots and cultivators, who enter into contracts do so dealing with, talking of and entering into their obligations on that basis. Then in this other part you tell us that the public do not realise that they are on a gold basis. Now, speaking from your own knowledge, is it not the case that all the cultivators you know up-country deal with the rupee as a rupee, not because it has a gold basis or any other basis?—Sir, may I explain that. This sentence is really not meant to be inconsistent with the subsequent sentence that you have just cited. What we meant here, if you will allow me to read it out again, was: "Prior to the war the rupee was valued at 7·5334 grains of fine gold (i.e., 1s. 4d. gold)." Then we explain: "In dealing with, and talking of, and entering into obligations in terms of rupee in the pre-war period, people did so as if they were dealing with, talking of, and entering into obligations in terms of 7·5334 grains of fine gold." What we meant is that when people deal in terms of rupees they deal in so many units of 7·5334 grains of fine gold and we have taken care to state afterwards that this factor was really not understood by the public but that for the scientist that was the way in which they conducted themselves.

8160. Quite true. But of course the agriculturists of whom you speak are not scientists. They deal with rupees and notes for the value which those rupees and notes realise in everyday transactions, and it is immaterial to them what the standard of value is so far as gold is concerned?—That is why, as I have said in answer to the Chairman, that is why we say that the gold coin is very necessary. People deal in rupees not knowing what it really is. What they find is that, although it contains alloy, it really can buy a larger quantity of silver than the weight of the coin itself.

8161. Quite true, but what I mean is that in the past the agriculturists and other people in India have been dealing in the rupee on its own merit as the standard coin in India?—And without understanding it.

8162. (*Mr. Preston.*) Mr. Khaitan, in paragraph 11, you state: "The Committee of the Chamber, therefore, suggest that as early as possible a gold standard with gold currency be unreservedly introduced in India." Then in paragraph 23, you state: "The Committee do not consider that the drain on gold even in the initial stage shall be very heavy." Paragraph 24, you say: "It is painful for the Committee to observe that an endeavour should now be made, evidently from interested quarters, to establish that India requires an

appalling amount of gold for the adoption of an effective gold standard." Now, suppose we leave out the "very" in your wording in paragraph 23, your Chamber then admit that the demand for gold in order to establish the gold currency would be heavy?—We don't think, Sir, that the demand for gold from the rest of the world will be heavy.

8163. Well you say that it will not be very heavy. I say we will leave out the word "very" and call it heavy?—We might make it "heavy."

8164. Now, let us assume for the moment that it was seriously considered to adopt the gold standard for India, and you say here with a gold circulation. And then come down now to paragraph 24 in which you say: "Preposterous as the proposition is, the Committee feel it as an outrage on the Indian nationalist sentiment to ask it to submit to a foreign loan." Now, if in the bringing into being of this gold standard which you desire it was found necessary owing to the heavy demand which you state will result to obtain assistance either in England or America by means of credit, would your Association object to any such measures being taken for that purpose?—Sir, our Chamber is convinced that there would not be any necessity for a foreign loan in order to adopt a gold standard and a gold currency.

8164A. Yes, but wait. You say that the demands would be heavy?—Would *not* be heavy.

8165. Not very heavy. I have asked you to omit the word "very" and therefore it would be heavy?—It would not be heavy.

8166. Very well, then. Assuming that it was found to be heavy and that recourse to credits was necessary, would your Association object to steps being taken to obtain these credits for the purpose which you so longingly desire?—Sir, we are convinced that these credits will not be required to adopt the gold standard and gold currency.

8167. But in the event of their being found necessary, would you object to such steps being taken?—We don't consider it to be necessary.

8168. I will go to another point. You have told the Chairman that lakhs of villages and 2,000 towns are populated chiefly by agriculturists forming about 70 per cent. of the population, and whose present position is one bordering on poverty—you also say that their daily transactions absolutely necessitate that they shall have rupees for the whole of their daily transactions—is that correct?—Yes.

8169. They don't want the gold there for their daily transactions. The transactions are so small that they don't run into gold?—Quite so.

8170. Then go back to paragraph 23, and you say: "What should the public really demand gold for in exchange of rupees?" Therefore they won't come in, owing to the gold standard being introduced and our having a certain amount of gold reserve to meet what we anticipate might be heavy demands for gold, they won't come to exchange their rupees for gold in your opinion?—Yes.

8171. Then you say; it was in response to a question the Chairman addressed to you, and your answer was that in so far as your Chamber was concerned they were firmly of opinion that it was not desirable to force gold on the country but merely to educate the people in the fact?—Sir, which paragraph?

8172. This was in the oral evidence in reply to the Chairman's question. I was merely reading a note which I took of what you said in answer to the Chairman. You said that in the opinion of your Chamber it was not desirable to force gold on the country. Then, if that is the case, of what value is it to have the gold currency at all? Who is going to benefit by such currency?—Sir, these are two different questions altogether. When I said don't force gold on the country I was referring to the fact that, unless gold can be tendered to the Government in exchange for Indian currency, the only result of it is that gold is forced upon the country in the form of bullion. That is not desirable. And so far as gold coins are concerned, if the people of the country see the gold coin to a certain extent circulating in the country, they will know that these silver rupees which are over-valued can always be converted into gold. That means that the people will have confidence in the currency of the country, and they will understand what it really means. At present that is not so.

8173. But with these 70 per cent. of India's population hidden away in these lakhs and lakhs of villages and towns, who only want rupees, who don't want gold or a gold currency, of what use would it be to them?—If he saw that he could get a gold coin in return at any time, he would have confidence in the currency.

8174. But would he know of the existence of gold coin, and if he did, has he got any surplus silver rupees to put into a gold coin, and if he kept the gold coin in these villages would it be of any value to him to go into the bazar to make his purchases with?—No, Sir. He would not require the gold coin for the purposes you have mentioned. But it is one thing to have confidence and another thing to have use for the coin itself. Now, surely when he goes into the bigger towns he will see some gold coin circulating. People talk among themselves, they talk about rupees, they talk about gold coins, and as soon as Government will declare that a certain number of rupees have the right of being converted into a certain form of gold coin, they will immediately come to know it. By immediately, I don't mean to say that it will be communicated by wireless, but the information will filter down to them in a short space of time.

8175. Well, if he does not want the gold coin for the purposes of circulation for everyday use in the bazar, do you not think that if a gold coin came in his way and he was able with a surplus rupee to acquire that gold coin, that he would hoard that gold coin?—The question of hoarding does not arise. He will require the rupees that he has got for his small purchases. There would be no occasion for hoarding gold coins in that manner so far as the agriculturist is concerned. Now about the middle classes, instead of making some ornaments they might hoard some gold coins, but that would simply be converting one sort of gold into another which would not cause a heavier drain. Some coins will pass into circulation as currency, and if a larger number of gold coins will be issued, they will always pass into circulation as currency.

8176. Let me put it to you in this way that in so far as 70 per cent. of the agricultural population is concerned, a gold currency would be of little or no value to them?—It would be of value to them in creating confidence, in their understanding what the token rupee is. At present when they see the nickel one anna bit, they understand that 16 of those coins will bring to them a silver rupee. Similarly they will understand that fifteen of these silver rupees could be converted into a gold coin if they had 15 silver rupees to convert.

8177. Now earlier in the morning you stated that the people of this country were clamouring for a gold currency, but that their demands were not satisfied. How do you reconcile that statement with this?—I do not see any inconsistency between the two.

8178. If they get a gold currency in the majority of cases that would never enable them to possess the gold coin, and that if they did, they would never be able to use it on account of its being of too high value for their local purposes. When it is said that the people want a certain thing, it does not mean that everyone of the 32 crores of people residing in the country ask for it or has formulated his opinion on it, and is ready to give his evidence before this Commission. The thinking portion of the population really represent the views of those with whom they come in contact. Now the generality of the people of whom you are thinking cannot understand what that coin, the rupee, is. Now gold coins were in circulation as they were from time to time, and they saw gold coins; they found that the gold coins were

again vanishing from circulation; now they say that the Government should again circulate the gold coin. They really talk about it in the bazars whenever conversation turns upon the question of currency; they say, "there were gold coins in circulation; the Government has withdrawn them; they should not do so; a gold coin is of full value and buys its own quantity of gold; we have the silver coin which does not."—They talk like this in the bazars.

8179. Some years ago Government in response to a certain amount of pressure from outside decided to put into internal circulation nearly $4\frac{1}{2}$ millions of gold; what became of that?—Afterwards, after the action of the Government those gold coins became useless as circulating media.

8180. Why did they become useless as circulating media?—They became useless because of the fluctuating value of the rupee.

8181. Where did they go?—They became useless because no consistent policy was followed. If you do not proceed upon a consistent policy, then the result would be what is only natural.

8182. I refer to another subject in paragraph 19, where you say, "Remittance operations should be confined to actual requirements, due advantage being taken of slack seasons, favourable ready or forward rates, etc. By so doing, trade will also be materially helped"; that is, we may take it that the opinion of your Chamber is that so far as Council Bills are concerned, the sales of Council Bills should be actually restricted to Government's home requirements only, and no sales should be made above and beyond that, is that the opinion of your Chamber?—Yes, the currency operations should be kept absolutely separate.

8183. No, no. The question is, in the opinion of your Chamber do they consider that the Government shall only sell for their actual requirements and nothing beyond? Have they expressed any opinion as to whether these sales should be by public tender, or the method should be proceeded with as now of the Imperial Bank, which would be the Central Bank later on, purchasing sterling in this country?—If you refer to paragraph 19, "The remittance operations of the Government of India may be managed by the Imperial Bank, but they should not be confounded or complicated with the Currency system, as was unfortunately done by Government." The next sentence is, "Remittance operations should be confined to actual requirements, due advantage being taken of slack seasons, favourable ready or forward rates, etc. By so doing, trade will also be materially helped."

8184. Do your Chamber consider that these sales should be done by public tender or that the system at present in vogue of the Imperial Bank buying sterling should be continued?—We have not considered the point at length.

8185. One more point in which you deal with the transfer of the currency note system to the Central Bank: have your Chamber considered whether it should be the Government notes which will be transferred and the notes continue to be issued as at present, or whether in the event of a new Central Bank being established, the Central Bank notes should be issued?—Our idea was that in subsequent years all notes should be gold notes, and they should be bank notes because the management would be handed over to the Imperial Bank.

8186. You would not continue the notes as actual Government notes?—That does not seem to be necessary, but we have really not considered that at any great length.

8187. (*Professor Coyajee.*) Mr. Khaitan, if you please, we shall consider the peculiarities of the position of India as regards the introduction and working of a gold currency; in the first place it is easier for India to introduce a gold currency on account of our usually favourable balances of trade; is that not so?—Yes.

8188. On the other hand, it has been suggested that the gold standard might easily become unpopular with the poorer classes when they see the value of their silver ornaments reduced as a consequence. The idea is that as India withdraws from the market for silver and that market is a very sensitive one, the price of silver will fall largely, and with that, the price of silver ornaments, which are the savings of the poor in the past, that price will also be reduced substantially. Will not that make the gold standard unpopular among the poorer classes?—You are assuming three things, firstly, that the adoption of the gold standard would reduce the number of rupees in circulation.

8189. I am asking only about ornaments?—You mean the fall in the price of silver simply through the declaration of Government that silver will not be purchased? Now so far as that is concerned, if you go up to 1s. 4d. then the price of silver will be increased by $12\frac{1}{2}$ per cent. by reason of the going back to 1s. 4d., and that follows as a matter of course. That is not a question of more rupees, it is as a result of the exchange. If silver is valued to-day at Rs. 75 on the basis of 1s. 6d., then immediately you go up to 1s. 4d., nothing else intervening, the price of silver would go up $12\frac{1}{2}$ per cent., that is by roughly speaking Rs. 9-8, that is it would become Rs. 84-8. Therefore roughly 1s. 4d. would give them that advantage, and if as a result of the declaration of Government not to have to buy silver as a result of the adoption of the gold standard, that might affect the price a little, and it is quite possible that——

8189A. You mean there is compensation?—Yes. I may say that if there is any apprehension on that score, you could help the cultivators by imposing a duty of 4d. per ounce of silver. It should be met in that way, not by depriving the country of a gold standard with a gold currency.

8190. Suppose rupees have to be sold, the position would be more difficult?—Well, firstly, our Chamber does not think that it will be necessary to melt silver rupees and sell the bullion content, as we have tried to explain in our memorandum, but if it becomes necessary—we do not think it would be necessary—the argument would be the same as in the case of the Government declaration that no further silver will be purchased. Now the country itself may require some of the silver Government has to sell.

8191. Then one observation you made to the President was to the effect that it is impossible that there should be a rush to present notes when a gold currency is introduced and to claim gold; but surely you will remember that in 1914 and again in 1917 there were big rushes in which notes were presented and the mints had to work night and day in order to coin silver?—You do not mean 1914, you mean 1917-18 when the import of gold and silver was stopped. Well there was all that confusion during the war, and I hope none of you will mind if I say that I think there was, wrongly, a great fear in the minds of the people that England may lose in the war, and all these fears did spread in the country. I have to speak about it with a great deal of hesitation, but there were those difficulties at that time.

8192. (*Sir Norcot Warren.*) In paragraph 20, Mr. Khaitan, your Committee refer to the issue of emergency currency, and they say that "there is a complaint that Indians did not in the past get a sufficient benefit from the issue of emergency currency." What exactly is meant by that?—Sir, about this sentence I regret that I won't be able to enlighten you further except to tell you that when the Committee considered the preparation of the memo. some members of the Committee were very strong on this point. They insisted on this sentence, and if you want from me details, I won't be able to give them to you.

8193. (*Chairman.*) I think it is unfortunate that we should not have this amplified, Mr. Khaitan, as naturally it provokes comment?—That is the position about it. Members of the Committee have felt like that. Personally speaking, I have not got that complaint, but some members of the Committee were very very insistent. It refers to private affairs which we do not want to disclose.

8194. (*Sir Norcot Warren.*) But when emergency currency is issued, do you mean to say that part of this emergency currency is issued by the Bank to some favoured customers?—In answering this question on the view of the Committee, I must tell you that I do not associate myself with that view. Now, the view of the Committee was that when emergency currency was issued the Imperial Bank got the money and the Imperial Bank helped the bigger industries under European control or the exchange banks which assisted European merchants or traders. So far as I am concerned, I have no complaint against the Imperial Bank.

8195. It is a very serious complaint to make against the Bank that they are holding emergency currency for a favoured few of their customers?—It is not really a complaint against the Imperial Bank only. What they say is this: Firstly, emergency currency is not issued until the Bank rate has reached 6 per cent. Now by that time stringency in the money conditions has already taken place, and movements of the crops have already begun. That you know perfectly well. Now if emergency currency had been issued earlier, and if that could go to help the Indian traders, that would be of some benefit. But if you issue it at a later stage, at about the time when the commodities go to the exporters or the industrialists, then the middlemen between the exporter or the industrialist on the one hand and the agriculturist on the other, will find it too late to get the benefit. Now that is a very general point which affects the conditions of the country as a whole. Now so far as that is concerned, I can say that much. In fact, we have already said so in a later sentence. But whether there are any individual cases or not, that is a different matter.

8196. (*Chairman.*) I think we can only note that on clause 6, which is, of course, a criticism which must necessarily attract very much attention, that you, Mr. Khaitan, as representing the Chamber and prepared to explain the views of the Chamber, do not associate yourself with the criticism, and are, unfortunately, unable to give us the foundation for the statement?—Except in that general way that I have said in answer to Sir Norcot Warren.

8197. (*Sir Norcot Warren.*) But I do not think that is an explanation.

8198. (*Chairman.*) The question which occurs to me is, does that serve to distinguish between Europeans and Indians?—The distinction works out between Europeans and Indians in that way generally speaking; but that may not be a sufficient answer, and I personally do not associate myself with it. That is the view of the Committee.

8199. (*Sir Norcot Warren.*) Would your Committee let me have an explanation?—I will ask the Committee about it.

8200. (*Chairman.*) Do you desire that the Indian Chamber of Commerce should be asked to give us any evidence that they have in support of this complaint?

8201. (*Sir Norcot Warren.*) Yes, that is what I want, Sir.

8202. (*Chairman.*) Perhaps Mr. Khaitan will bring that to the notice of the Chamber and make known to them the wish of the Commission in this respect.*

8203. (*Sir Purshotamdas Thakurdas.*) I see that you have not put in any personal memorandum of our views, and I therefore propose to ask you about something which you appear to have written to the press here. The witness who is to appear this afternoon says in his memorandum: † "That is why we find at least one knowing currency expert in this country, Mr. D. P. Khaitan, of Calcutta, recommending the issue of gold mohurs with a smaller gold content than what their purchasing power may procure. Why there should be such a metallic medium at all for currency purposes has not, however, been explained." Could you tell us what this reference is to and whether you could enlighten us regarding this scheme of yours?—Perhaps it refers to an interview which I gave to the representative of the Statesman. In that the scheme was quite different and that was my personal view about a consumption tax on gold. Now after that interview appeared, I have interviewed a large number of my friends, and they have very much disliked the idea of the consumption tax on gold, and that being so, I have dropped that scheme altogether. It is not desirable to go on with it when it is disliked by the Indians. Does it refer to that, Sir.

8204. He does not say that. I read it there and I presume it must refer to that. Then I take it that you have yourself rejected this idea of a token gold coin?—That token gold coin was a necessary concomitant of a consumption tax on gold. As I have dropped the consumption tax, the debasement of the gold coin automatically goes.

8205. As regards the want of confidence created in minds of the people, as you yourself said, the same arguments advanced against the token rupee apply against the token gold coin?—To a great extent, yes.

8206. Absolutely to the same extent?—Yes.

8207. Now regarding long term contracts, you divided them into two parts in reply to the Chairman; one was the daily contracts and the other, contracts going on in the country for a long period. I understood that you thought that the indebtedness of the ryot formed the largest bulk of the long term contracts?—Not simply the indebtedness; but also the land revenue and other things.

8208. Supposing you are considering only the debt part, then the indebtedness of the ryot would be the largest?—Yes.

8209. Do you think this form of contract or debt has any possible cover with which the cultivator could protect himself against a rise in the rupee?—No.

8210. You said something in reply to the Chairman about the coal freights. I wonder if I understood you correct. Has there been any reduction in the coal freights at all during the last 2 or 3 years?—No, when did I say?

8211. I think the Chairman said that we have it in evidence that the coal freights had gone down and I want to know whether you confirm it. We have it in evidence that they have gone down. Have they really gone down?—No, not at all.

8212. Are you very intimate with the coal trade?—I have to buy coal and take it to Gwalior and Delhi and there has been no reduction at all in the coal freight.

8213. At least there is no reduction in the freight between Gwalior and Delhi?—No. I am just now told that there is a small reduction in the Great Indian Peninsula Railway. But there is no reduction of freight to Calcutta. The coal that we buy for consumption in the mills, that has to pay the same railway freight.

8214. Coal freight rates to inland places has had no reduction?—No.

8215. You said that your committee expressed the opinion in very strong terms that there are no hoards of rupees. It has been reported to us by witnesses that they know of rupees from villages coming stained with earth. Where would they come from, if not from hoards, Mr. Khaitan?—What happens is this. I am talking from actual experience. I had been to the villages in my zamindari. The small agriculturist who harvests the crop carries it to the nearest market not a very big market like the Calcutta or Bombay market of which you may be thinking, but a small market, he sells it there and takes rupees in return for that. When he takes those rupees home he has to put them somewhere for payment of land revenue, interest to the mahajan and so on. He is so poor that he cannot have even a box to keep it. He keeps it either under the earth or in the mud wall of

* A communication was subsequently received from the Secretary of the Chamber, stating that the matter had been brought before their committee, and that "it was regretted that the specific facts asked for by the Commission could not possibly be furnished, though such failure on the part of the Chamber should not be construed as tantamount to a withdrawal by the committee of the remarks in question."

† Appendix No. 40.

the hut in which he lives. Now by the process of rain or moisture or dew, naturally the rupees catch some earth and when they come out into the market, the people do not take the trouble of washing out the mud and on account of the perspiration perhaps it sticks better. But certainly that cannot be evidence of hoarding. It is simply the manner in which they keep the rupees, the manner in which they handle them.

8216. It practically amounts to this: That instead of putting it in a box, the cultivator puts the rupee in the mud wall and mud sticks to the rupee but that does not necessarily mean that the rupee has been in the hoard for a long time or has been hoarded at all?—Not at all, Sir.

8217. Now supposing it was thought desirable not to have gold currency but to have gold in the Treasury for export purposes and gold notes were issued promising one or two mohurs or sovereigns as the case may be. What effect do you think such inconvertible gold paper will have on the masses?—It will not create confidence. People want to see gold coins. They must handle gold coins.

8218. And I want to put to you this particularly. Supposing that gold note was paid at a market centre to an agriculturist. Would the agriculturist have to pay discount in cashing that note which is inconvertible?—You mean inconvertible notes?

8219. Yes, inconvertible gold notes?—I thought you meant convertible gold notes.

8220. Convertible gold notes would mean gold coins?—Inconvertible gold notes would be useless. By useless I mean they would not render service and they will carry discount in the market.

8221. It is most undesirable?—Yes; it is very undesirable.

8222. Do I understand you to say that in jute trade wages have gone up by 50 per cent. since 1914?—Gone up by 50 per cent.

8223. And in the coal mines by 25 per cent.?—Yes.

8224. Are you sure about that figure?—I am not quite sure about it.

8225. (*Sir Reginald Mant.*) Mr. Khaitan, can you tell us what parts of India your Chamher mainly represent or are your memhers mostly of Bengal?—They are all merchants carrying on business in Bengal.

8226. They are all from Bengal?—Yes.

8227. Why do you call yourselves an Indian Chamber when it really only represents Bengal?—It means a Chamber of Indian merchants.

8228. Yes, but you do not represent the whole of India?—Well it happens like this. Some members have got branches and businesses in several parts of India and to that extent the members of our Chamber have knowledge of the conditions existing in almost every part of India.

8229. Now you said in reply to Sir Purshotamdas that you had abandoned the idea of a debased gold coin. I notice in paragraph 15 of your memorandum you recommend a mohur of 90 grains weight containing 7·5334 grains of fine gold.—It ought to be 75·334. May I have the liberty to correct it?

8230. (*Chairman.*) Certainly.

8231. (*Sir Reginald Mant.*) Yes that is a misprint. Then your coin has a larger proportion of alloy than the sovereign?—No, Sir, that gold coin would pass at the value of 75·334 grains of fine gold and not at the value of 90 grains of gold. The alloy is useless for valuing purposes; it is only to make the coin half a tola in weight.

8232. That is what I wanted to clear up. I wanted to ask why you propose a coin of a less fineness than the sovereign?—That is only to make it equal to half a tola to make it convenient.

8233. But why is it convenient to have half a tola?—Well that is only a matter of detail. If you do not want to have half a tola, don't have it. What we want is 75·334 grains of fine gold equal to 10 rupees. As to the quantity of alloy if you do not want it you need not have it.

8234. That is really immaterial?—Yes.

8235. In paragraph 16 you say " Apprehensions are often expressed that if gold coins are allowed to circulate in this country there will be a great scramble for gold in the world market, commodity prices would fall and trade and industries in the world would suffer. The Committee cannot in this connection conceal their feelings of resentment that such a question should be raised in the case of India alone." I presume you are acquainted with the recommendations of the Genoa Conference?—Yes, we have referred to it, you will find that in paragraph 16.

8236. Then you are aware that the Genoa Conference recommended economising gold and discouraging the use of gold as currency in other countries of the world, are you not?—That is simply a recommendation.

8237. I am coming to that; just let us take one step at a time. You are aware that that was the conclusion of the Genoa Conference?—But it has not been adopted.

8238. Quite so but you do agree that that was the recommendation of the Genoa Conference?—Yes.

8239. Then why does your Chamber express resentment and suggest that such a question should be raised in the case of India alone? When the Genoa Conference make a general recommendation that it should be adopted in other countries, why do you suggest that the question has only been raised in the case of India?—We have already said in the memorandum what constitutes a reply to what you are asking; you will find it in paragraph 16: " When several countries come together, including England and the United States of America, to confer about the adoption of the gold exchange standard by them all India might also be invited to the conference as a separate unit to take part in their deliberations, and with the experience of a pure currency system obtained in the meantime will be able to give the benefit of her advice and to adopt such joint action for the benefit of the world as may then appear feasible; but until that time arrives there can be no justification in depriving this country merely because of her political weakness from adopting a sound system of currency."

8240. That does not answer my question?—I thought it did.

8241. I pointed out to you that the question was raised as a general one and you suggest here and you express resentment that it was only raised in the case of India?—If it is raised as a general question, first let us have a gold standard and gold currency.

8242. One minute, you have already agreed that it was raised as a general question?—That is of a quite different nature. The Genoa Conference's recommendation is of a different nature from the question you are examining here at present. In our opinion you ought to come to the conclusion that a gold standard and gold currency is good for the sake of India. Now if that is adopted and then if several countries meet together and some joint decisions are made for the benefit of the world, India will not lag behind. But if India alone is told that you must not adopt the gold standard and gold currency while all other countries will be at liberty to do so, that is the reason for our resentment.

8243. Well, now we come to a point further down where you say " It is said that if the Geona Conference preferred a form of gold exchange standard to the gold standard it was because deflation was considered too risky for most countries." What do you mean by that?—What we mean is take the case of France. There the pre-war parity of 25 has long been exceeded and it is in the neighbourhood of 120 or 130. Now if they have to come back to the pre-war parity of 25, then they have got to deflate their currency in order to come back to the pre-war parity.

8244. But let us leave out the pre-war parity. We are considering the demand for gold and the amount

of gold required for a gold currency?—If you will remember, Sir, that was one of the factors which was considered by the Genoa Conference, namely, the currency of several countries having left the pre-war parity and as to what should be done in order that they may attain normal conditions without a disturbance of internal conditions. Now if they had to attain pre-war parity again that would have required a large amount of deflation.

8245. I have asked you to leave out pre-war parity. The point I want to get at is how deflation would be required to introduce a gold currency. It is perfectly possible for a country to stabilise at the existing rate of exchange?—By adopting a new gold coin, yes, and by fixing the new value of paper currency in terms of a gold coin, as Germany has done by the Reichsmark.

8246. Yes, Germany has done it. So the question of deflation does not really come into the picture in considering the amount of gold required?—Yes, Sir; you have either to deflate or devaluate; one of those two things you have to do. You cannot do otherwise; you have to choose between the two.

8247. But the point I want to put to you is that the Genoa Conference preferred a gold exchange standard solely for the purpose of economising the use of gold and not as you suggest here in order to avoid deflation?—So far as Indian conditions are concerned we have had such a bitter experience of the gold exchange standard, whether it was recognised as such or not, whether it was a perfect system or not, we have had a very bitter experience of the gold exchange standard; our standard of value has been interfered with from time to time, and if we want to create confidence in the country in the currency system you should first adopt the pure system. After that is done and after confidence is gained, then will be the time to consider whether the use of gold can be economised or not. But if you try in the very beginning simply to continue the present system, I do not think that will be a wise thing.

8248. (*Chairman.*) We are very much obliged to you for your Memorandum and for your assistance to-day.

(*The witness withdrew.*)

The Commission assembled after lunch, Sir Reginald Mant in the Chair.

Mr. A. Ramaiya, called and examined.

8249. (*Chairman.*) Mr. Ramaiya, you are a Fellow of the Royal Economic Society?—Yes.

8250. You are a practising vakil?—Yes, in Madura in the Madras Presidency.

8251. And you are also a student of currency questions?—Yes.

8252. And the author of a book, "A National System of Taxation"?—Yes.

8253. You have been studying this question for a long time?—Ever since I took my degree in Honours in the Madras University I have been studying, not persistently but occasionally.

8254. You have given us a very full memorandum,* and I shall therefore only ask you a few questions to elucidate various points in it. You begin by sketching the past history of what you call the rupee standard and come to the conclusion that it has broken down. In referring to the 16d. rupee in paragraph 1 of your memorandum, you say that this ratio could be maintained only during times of favourable balances of trade. It was in force for a good many years, was it not?—Yes; but it was in force not on account of any merits in itself, but because the country generally had a favourable balance of trade; that is my view. The success was due not to the standard itself, but because the country generally had a favourable balance of trade during almost all those years.

8255. That is a normal feature of India's trade, is it not?—That is the normal feature of India's trade.

8256. You say that it could be maintained only during those times?—I judge it from the failure it had experienced in recent years in the post-war period.

8257. You refer to the period 1907-08, do you not? You say that the pre-war standard of 1s. 4d. could not be maintained during that time?—I was led into that impression by an article by Mr. Khaitan in the "Forward"; but I find that it is not quite accurate; it is not my own view; I verified the statement yesterday and found it not to be quite correct.

8258. Then you are referring to the post-war period when you say that the 1s. 4d. rate broke down?—Yes.

8259. That was on account of the rise in price of silver, was it not?—Yes.

8260. Then you say "again during and after the war the Government has also miserably failed to maintain the exchange with the help of its gold standard reserve." To what are you referring there?—Maintaining exchange level at 1s. 4d. It could not maintain it at the pre-war ratio.

8261. You mean that it could not keep it down to that level or do you mean that it could not keep it up to it?—Keep it down to that.

8262. With the help of its gold standard reserve? I do not quite see how the gold standard reserve could be utilised for keeping it down. What exactly do you mean by the reference to the gold standard reserve?—It could not issue internal currency during that time. A favourable balance could not be met by the Government's policy to issue silver rupees. The Government could not issue silver rupees on account of the rise in price of silver.

8263. What do you mean by the reference there to the gold standard reserve?—That portion of the reserve which is kept in India for issuing silver. The Government has in the normal period, I understand, to issue silver rupees in India for those persons to whom money is due from foreign countries. That the Government could not issue.

8264. But the gold standard reserve was never intended as a reserve for holding silver or providing rupees. The gold standard reserve was intended to prevent a fall in the value of the rupee. It was intended to provide gold resources——?—For discharging foreign debts.

8265. Yes. The silver holding to which you refer was, I think, rather a temporary accident when the gold standard reserve had been utilised for contracting the currency and the rupees were placed temporarily in the gold standard reserve. Is that the period to which you are referring there?—I think it is more likely that this will refer to the period from 1919 to 1922.

8266. There were no silver rupees in the gold standard reserve then, were there?—The next sentence will show that what I meant was that "the system itself collapsed when silver prices ran too high to make it profitable for Government to issue further coinage with the result that the main spring of the reserve broke down hopelessly." What I meant in the previous sentence is explained in this next sentence.

8267. What do you mean by the main spring of the reserve?—The capacity of Government to issue silver rupees in India, and also the capacity of Government to provide foreign currency. It had neither this nor the other capacity.

8268. But the rise in the price of silver prevented it from providing internal currency?—Yes.

* Appendix No. 40.

8269. And the gold standard reserve was not intended to provide for that, was it?—The gold standard reserve was not intended for it. That is the necessary consequence of it. The gold standard reserve is associated with it—or rather the associated purpose which the Government had was to issue silver rupees in India in times of favourable balances. On account of the high exchange, Government could not provide foreign currency in other countries nor could it issue silver rupees in times of favourable balances in India.

8270. You go on to describe the Indian currency as an essentially managed currency?—Yes, I do.

8271. And you say that "two things are necessary for the successful working of the currency system of the country, one is that the value of its monetary standard should remain stable inside the country and maintain stability of internal prices"?—Yes.

8272. I understand from the subsequent arguments in your memorandum that you propose to maintain stability of internal prices by means of a gold standard securing a stable exchange?—Yes, by a stable exchange and also with the help of the bank rate.

8273. With the help of the bank rate. We will come to that presently. Now about the middle of paragraph 3 you say: "From the point of view of the nation as a whole a high or rising exchange has a more injurious consequence for her industries and trade than a low or falling exchange"?—Yes.

8274. But at the beginning of the next paragraph you say: "It is true that every variation in the exchanges has only a temporary and transitory effect, and ultimately leads to readjustment by setting the necessary forces in motion." So, when you talk about a high exchange I think you must mean a higher exchange?—I do hold the opinion that it has only a temporary effect.

8275. And when you are referring to the ill effects of a high exchange there you mean merely a rising exchange?—Yes, a rising exchange and a high exchange if it continues only for a temporary period.

8276. If it has only a temporary effect. But you say that the purchasing power parity never gets restored to its original position of equilibrium?—Yes. It does not exactly come to the original position. Various economic forces act and react upon one another and the new position is not exactly the same as previously. Some changes on account of the play of economic forces are brought about so that the exact position which existed previously is not restored.

8277. Then you go on to say that India has now neither a gold rupee nor a silver rupee?—Yes.

8278. The position is, is it not, very similar to that of various other countries whose exchanges broke down during the war and who had temporarily to abandon their pre-war standards of exchange. India is at present in much the same position?—Yes, in much the same position. Exactly so.

8279. Now I come to your proposals for remedying the present defects. You consider that the time is now ripe and opportune for the adoption of a gold standard in India?—Yes, I do.

8280. And you say that the problem as to whether we should stabilise our currency with sterling or with gold has disappeared?—Almost certainly disappeared.

8281. You assume that sterling will remain permanently linked to gold?—I think so, from the Gold Standard Act that has been passed recently.

8282. And you say that in your view world conditions have now become stabilised enough through the return of a good many countries to the gold standard for us not to expect any more such rapid and violent fluctuations in the exchanges requiring a quick reaction for the maintenance of the equilibrium as we experienced before. You don't think there is any longer any danger of fluctuations in gold prices?—Fluctuations in gold prices may occur and will depend upon the policy of the United States. But what I mean there is on account of the post-war effects having become fairly stabilised in all countries and each country being anxious to return to a gold standard and some having already returned to the gold standard, the world condition has become fairly stabilised.

8283. In fact, you think that the more countries that return to the gold standard, the greater the general stability. Is that your view?—That is what I think.

8284. Then in paragraph 8 (iii), you say: "If indeed India had had a gold standard, the depression of 1920-22 would probably not have happened at all." The depression of 1920-22 was due, was it not, to a very large and sudden fall in world prices. How would that have been prevented or mitigated if India has possessed a true gold standard?—So far as the countries with which India has been dealing were concerned, they had a gold standard at the time. I mean Great Britain, the United States and Japan. And if India also had had a gold standard, then the adjustment between these would have been easier.

8285. The adjustment. But what about the depression in India? You would have had a very violent fall in prices in India, would you not?—The fall in India would not have been so violent.

8286. Why not?—The Indian prices had been more stable previously than in other countries. So the fall in prices in India would not have been as great as in other countries.

8287. But was not the fall of prices in India mitigated by the fall in exchange. If you had had a gold standard and maintained it, the fall in exchange would not have occurred, but surely there would have been a greater fall in prices and still greater stringency in the country?—A greater fall only in certain prices, those prices which enter into the process of international trade. There are certain prices which do not enter into international trade at all; such prices would not be affected.

8288. They would not be affected at all?—They would not be affected to an appreciable extent.

8289. Do you hold the view, which I think is commonly accepted, that articles which enter into foreign trade affect the price of other articles?—They do not affect them so much. It takes some time for affecting them, but there would be an appreciable effect only upon prices which enter into international trade. The effect will not be so great on other articles as it would be on articles which enter into international trade.

8290. But that does not affect the argument here, does it, that exchange took a part of the shock and mitigated the fall in prices? If you had a gold standard, there would have been a more severe fall in prices and a more severe stringency?—There would not have been a great fall in prices because the imports would have diminished during that period. If there was a greater fall in Indian prices, there would not have been so large imports as there actually were. It would have simply had the effect of minimising the quantity imported.

8291. You say that the adoption of a gold standard does not mean also the keeping of gold coins in active circulation, and you controvert the view which has been put to us by a good many witnesses that in order for India to arrive at the ideal system of currency, namely, an inconvertible paper currency backed by gold, that it is necessary for her to pass through the intermediate stage of a gold currency. You do not hold that view?—I do not hold that view.

8292. Could you enlarge your view at all there? We have been told that the people will never give up hoarding until they are satisfied that they can get gold coins if they want them?—My main reason against the introduction of gold coins into circulation in this or any other country is that it is not necessary. A metallic currency is absolutely unnecessary anywhere and it is especially unnecessary and also inconvenient in this country for this reason that gold coins are apt to be melted by people in the rural parts who have now no easy access to gold in the form of with the result that there would be a de-

flation of currency, that there would be a fall in prices if people absorb the gold coins as is being usually done in the rural parts. What I mean is that in rural India gold is not available for social purposes except in the shape of coins. If gold is not easily available—and gold coins are issued with a full gold content, the result would be that the only way in which the people of rural parts can get hold of coins, being made easy they will freely melt them for making jewels and employing them for other social uses; when we find the imports of gold into this country during the past two or three years when gold has become cheaper, and fallen in price, when we find that India has been importing remarkably large quantities of gold during the last three or four years not for any currency purposes but purely for social uses, my fear is that gold coins would certainly go to the melting pot in the rural areas, with the result that there would be a fall in prices, a greater fall than may be traced to other causes.

8293. But the view put to us has been that the people hoard gold and melt coins because it is so difficult to get gold, and that if they could get it easily, they would give up this habit of hoarding and melting?—So far as I am aware—I do not know what they mean by the word "hoarding"—the only purpose for which gold is desired in this country is for social uses, that is using gold idly in jewels and other social purposes. I have not come across any instances of persons hoarding gold and putting it underneath the earth or elsewhere. By "hoarding" I only mean using it idly for social purposes. If people have got the desire to use it, that desire is dependent upon other social causes and not because there is any difficulty in getting gold coin. There desire continues to exist, whether there is gold coin available or not.

8294. You have not come across any instances? Have you ever heard of rupees being hoarded?—I have heard that rupees were being hoarded that is accumulated idly in the 18th and 19th centuries but not recently. But that is not the kind of hoarding I have in mind. By hoarding I mean employing it idly for ornaments and other purposes; and I am very certain that if gold coins with a full gold content are used, they would certainly disappear from circulation; part of them will go out of circulation and go to the melting pot.

8295. And then for facilitating international payments, would you have your Currency Exchange Reserve kept not only in commercial centres in India but in those foreign countries with which our international trade is mainly carried on? It has been represented to us that the reserve ought to be in gold and ought to be held in this country. I gather that you do not share that view?—I do not share that view. My reason is that the objection against locating the currency reserve in foreign countries is purely founded upon a political suspicion. If the currency is entirely separated from the Government and entrusted to a bank of the kind which I have advocated, then I do not think that the people of this country will have any objection to locating the currency reserve in foreign countries as well as in India, especially in those foreign places with which we mainly deal. I find that in other countries, for example Japan and New Zealand, they do hold their currency exchange reserves in London and other important foreign places with which they have to deal.

8296. Do they hold them in gold or in foreign securities?—Yes.

8297. I gather that you would prefer to hold them in securities?—Yes, but in present conditions I think it is safer to hold it partly in gold and partly in liquid securities.

8298. In foreign countries you would hold the gold also?—Gold in India and securities in foreign countries.

8299. Now with regard to the ratio of the rupee to the pound, you say that the rupee may be reduced to the position of a subsidiary monetary unit at a fixed ratio of say fifteen to one to the pound sterling. Could you explain why you support that particular ratio?—Though the ratio is immaterial when the rupee is reduced to the position of a susidiary coin, my reason for maintaining that ratio is that for a long time we have been familiar with such a ratio in this country, and any other ratio will require an arithmetical calculation in people, which is wholly an unnecessary trouble that may be avoided.

8300. And would you introduce that ratio at once? —Yes, if the rupee is reduced to a subsidiary coin, that ratio may be introduced at once.

8301. Would that not cause an immediate rise in prices and a general unsettlement in commercial conditions?—I do not think it will have any effect upon commercial conditions if the rupee is to be a purely subsidiary coin and the main currency of the country is to be the pound or the mohur as I have suggested.

8302. Would it not cause an immediate rise in prices?—I am unable to see how it will cause a rise in prices, except that in some commercial transactions those who have bargained in terms of rupees may feel some difficulty.

8303. Surely you would have to pay 12½ per cent. more for everything that you import, would you not? —When this ratio is to be restored, there will be a main currency for the country. The chief currency for the country will be in terms of a gold standard, in the shape of the pound or the mohur, and when that is the case, those people who have made contracts may have to pay in terms of the pound, in terms of the main currency of the country.

8304. Do you mean that you would convert all rupee debts at present into gold debts at the rate of Rs. 13⅓ to the pound; is that what you mean?—I have suggested Rs. 15 to the pound.

8305. You say that you would subsequently introduce this fifteen ratio after you had converted all debts on to a gold basis?—Yes, after converting them into a gold basis, otherwise the sterling debts would be larger.

8306. I do not quite follow?—I do recognise that if it is suddenly introduced before the main currency is introduced, there would be some dislocation of commercial transactions, but that will not in any way affect prices in this country because it will lead neither to an increase nor a decrease in the existing volume of currency.

8307. Let us deal with prices first: you say it will not affect prices at all if you reduce the value of the rupee from 1s. 6d. to 1s. 4d. You say it will not affect internal prices?—Yes, internal prices. It may not have any effect on internal prices, because it does not increase or decrease the volume of the currency. It keeps what is in circulation. With regard to transactions with other countries, on account of adopting this ratio, there would be a difficulty so far as the importers are concerned.

8308. Then it would affect the prices of imported articles?—It will not. The foreign sellers are now gaining in terms of sterling a larger amount than what they have been gaining previously.

8309. But taking things as they are at present if you want one pound worth of foreign goods you have actually to pay Rs. 13⅓. If you reduce the exchange to 1s. 4d. you have to pay Rs. 15 for the same amount of commodities?—At the same time we also have a gold standard. Only if we have a gold standard we have this ratio.

8310. But you will have still to pay Rs. 15 instead of Rs. 13⅓ for £1 worth of commodities; will you not?—Of course there is some difficulty. That is what I also feel. There is some difficulty with regard to the dislocation of prices. Prices may be affected. But this ratio would naturally have been brought into existence but for the Government withdrawing from circulation the amount that it is now locking in the currency reserve.

8311. Now you recommend that the currency system of the country should be entrusted to the

Imperial Bank, which requires to be first converted into a State Bank and a Banker's Bank?—Yes.

8312. And you say later on, "Of course this system requires for its successful working the development of a credit system which we do not have in India at present?"—Yes.

8313. Am I to understand that you would defer this transfer of the currency to a State Bank until the credit system in India has been developed?—That is not necessary. The credit system will make things easier. Until the credit system is developed we need not postpone this. If the Bank becomes a Bankers' Bank, necessarily the credit system would develop easily and quickly.

8314. You mean to start the Bank and trust to it to develop the credit system? Is that what you mean?—Yes.

8315. And you think it could do that in a very short time?—It may take some years. It may take even 10 years for the full development. But that need not stand in the way of the Bank discharging the duties in the manner indicated in my memorandum. The development of the credit system is not an essential part of the currency system. It may be of much use for the country. But that is not necessary for the success of the currency system and for the State Bank taking it over.

8316. You mean that it could work the currency, but it could not control credit and therefore internal prices? Is that your position?—Yes. If it becomes a State Bank through which all the other banks are made to transact their business, then with the help of its bank rate it can also to a large extent control internal prices and keep them fairly steady. But for the purpose of regulating the currency, it is not necessary that a credit system should develop.

8317. (*Sir Purshotamdas Thakurdas.*) Mr. Ramaiya, you said in reply to the Chairman that you did not think there was any hoarding of precious metals in India. You don't think there is any hoarding of precious metal in India?—I do not know in what sense it is used. If it is in the sense that the metal is locked up in pots or buried underneath the earth or put into boxes and kept idle, I must differ from any person who holds an opinion that there is hoarding in that sense.

8318. In what sense according to you is there holding of precious metals by the people of India?—Hoarding?

8319. You said you did not believe in hoards; I therefore use the word "holding"?—By using them in jewels, ornaments and other social uses.

8320. I see; you do not believe that the people hold precious metals in bullion form at all; but as soon as they get precious metals they convert them into some sort of ornaments or utensils?—Yes; their demand comes in for that purpose only. My view is that the demand of the people is only for social use.

8321. Not for the purpose of holding it as bullion?—Not to my knowledge.

8322. Then regarding the 74 crores worth of gold which was imported last year to which you refer in paragraph 10, it was all for the genuine purpose of jewellery?—Jewellery and other connected purposes.

8323. Social or religious purposes?—Social and religious purposes.

8324. And the people want that, therefore, for bonâ fide purposes?—For ornaments, to satisfy their æsthetic taste.

8325. That is bonâ fide indeed, as far as the nation is concerned?—Yes, bonâ fide.

8326. If a gold coin were in circulation, your apprehension is that the people instead of buying gold bullion in the market would turn the coin into ornament?—I must make myself accurate. I mean gold coin with full intrinsic value.

8327. We are talking of a gold coin with full intrinsic value?—Almost all people in rural parts, so far as I know in that part of the country in which I have some knowledge, are getting gold only through sovereigns and not in bullion.

8328. Even when the sovereign is not a current coin?—Yes.

8329. And your apprehension or your disapproval of a gold currency is . . . —Of full intrinsic value?

8330. Whenever I say gold currency, please understand that I am talking of gold coin with full intrinsic value, not a token coin. Your apprehension regarding gold currency is that the people may use the coin for the purpose of turning it into ornaments instead of going to the market to buy gold?—Instead of going to a distant market to buy bullion. People of rural parts have got access to the bullion market, but gold coins come to them.

8331. Well, the sovereign has not been current in India as a coin for the last few years?—Not through the Treasury, but it is sold in all villages.

8332. Therefore, it is available to the people?—Yes.

8333. And gold bullion would also be similarly available to the people if there was a demand for it?—If there was a demand it would be available.

8334. Therefore, there will be no difficulty for the people in getting it?—There will be no difficulty.

8335. Why do you then think that the people will use the coin for the purpose of conversion of it into ornaments in preference to gold bullion?—My reason for that is, while for gold bullion they have to go to a market, so far as currency is concerned, it comes to them. Merchants and others come and pay them in gold coin, and they take the easiest course.

8336. Has it come to them in the last few years?—Within the last few years, after the war, it has not come to them.

8337. Still they have managed to make ornaments worth 74 crores?—Yes.

8338. How has that happened?—With regard to these 74 crores, they represent the requirements of some other years. It was imported into this country in anticipation of future demand on account of the cheap prices.

8339. It does not matter. Whatever the requirements of the people were for the current year they made them out of the gold bullion, the sovereign has not been current?—These 74 crores do not merely represent bullion. It represents both bullion and coins.

8340. Total imports? What I want to find out from you, Mr. Ramaiya, is, is your apprehension that the gold coin will go only into ornaments justified?—Ornaments only, I will not say. It is liable to go into ornaments in the rural parts.

8341. If it is not a token coin?—Yes.

8342. Did it so go before 1914, Mr. Ramaiya?—I find that the silver went so in 1921-22.

8343. When the price of silver was above the melting point of the rupee?—Yes.

8344. But when the price of gold and the gold contents of the sovereign are the same, as was the case before 1914, and when Government gave out the sovereign from the Treasury, do you find that the people use the sovereigns for the purpose of ornaments?—They used the sovereigns for the purpose of ornaments previously, before 1914.

8345. Have you any idea of the figures of the taking of sovereigns by the people before the war from the Government Treasury?—No.

8346. You don't remember that?—I don't remember that. But before 1914 gold coins were not used for currency purposes.

8347. The Government used to give them out from the Treasury whenever they could spare them?—Yes, and the demand for them was more or less for only social uses. That is my view.

8348. If the average over a period of 12 years (1901-2 to 1912-13) worked out to only $7\frac{1}{2}$ crores of sovereigns and if the people did not take more, would you say that people use all sovereigns only for ornaments?—Mostly for ornaments, that is my belief.

8349. You quote from a Professor of Economics of Madras University and you say that he does not explain the reason for his statement?—That is about the intermediate stage which he refers to.

8350. Yes, that is all here; I am only referring it to you now. Can you suggest any other method by which to popularise your gold notes, currency notes issued against gold in the Treasury? Do you think the people will take inconvertible gold notes?—I think they may be made convertible into gold bullion. I find from the official memorandum just now given to me bank notes should be payable on demand. I find on page 1, gold notes should be payable on demand in rupees and so on. Instead of that, as they do in England just now under the Gold Standard Act, if gold bullion in fixed quantities is given to the people in return for currency notes representing a pound or any gold currency notes, I think people would take the notes and the notes should be very popular.

8351. The minimum for this sort of conversion would be fixed fairly high, it would exceed at least a thousand rupees?—Yes, it would exceed a thousand rupees.

8352. Do you think that would be appreciated by people in the rural areas?—If not one thousand rupees, it may be fixed at Rs.150 or Rs.200.

8353. I see, you would make gold bullion worth Rs.150-200 available in conversion for the gold notes?—Yes, if really such a thing is desired. I, personally, find as a person having only an academic interest that if notes were made inconvertible in the country there is no reason why such a thing should fail to be popular. But if gold is desired for these gold notes, then for the purpose of caution you may well say that gold bullion may be made available for notes.

8354. We are trying to find out whether it is desirable or not. We seek your assistance in that matter. As an ideal it is all right; everybody should try to work up to it. But do you think that ideal is feasible in India at the start. Let me put you a question. Supposing a cultivator, upcountry in the rural areas, gets gold notes to the value of say Rs.600 and it is inconvertible, do you think that he would either like it or that it would not inconvenience him very seriously?—It will not inconvenience him for currency purposes and I do not think he will dislike it.

8355. You don't think it will inconvenience him?—No, because the existing rupees are also in circulation as full legal tender. For higher amounts he would require notes. Even now 100 rupee notes and other notes are very popular and the same condition may prevail.

8356. The 100 rupee note can go through the Treasury and he can convert it into silver?—But very few go to the Treasury to convert 100 rupee notes into silver because they are very popular. 100 rupee notes are circulating and notes of smaller denominations and rupees are readily available when wanted.

8357. But the mere fact that he could convert it, that he could get 100 silver rupees for it has an additional value in it for the ryot upcountry. Supposing there is a 5 sovereign note—you yourself suggest 5, 10, 50 and 100 sovereign notes somewhere; supposing there is a 5 sovereign note which is given to a ryot in exchange for his produce. Surely he wants to change it into smaller fractions?—Then he can change it into 5 rupee notes which are in existence.

8358. The gold notes therefore *primâ facie* though inconvertible in gold would have to be convertible in silver?—No, convertible into notes of smaller denominations.

8359. Silver notes?—Not necessarily notes of silver; fractions of pounds; and fractions of pounds I call rupees instead of shillings.

8360. Yes but fractions of pounds are rupees, therefore the gold note will be convertible into silver?—Not silver, but into rupee notes.

8361. You mean into silver currency paper?—Yes.

8362. I see; and thus you can avoid having to call for any bullion at all against the paper when he wants to change it. That is your point?—Yes, except for social purposes he will not require gold currency—except for purposes connected with ornaments and other social purposes.

8363. He need not change it into gold?—He will not change it and he does not care to change it.

8364. And you say silver rupees should be unlimited legal tender?—There will be the existing silver rupees, but no more fresh rupees should be coined.

8365. You further recommend that no more silver rupees should be coined?—The only way out of the difficulty is to keep the existing silver rupees. Otherwise, to convert them will reduce the price of silver in the world market and will cause a great loss to the country.

8366. In order to avoid that loss and also to make available for the people of rural parts you want rupees of smaller fractions?—The existing silver rupee may be full legal tender. They are already acquainted with it.

8367. Keep the existing silver rupee full legal tender and coin no more rupees?—No more silver rupees.

8368. That is for the present or do you think that should be laid down for ever?—For ever. Of course in currency matters no one can claim permanency for an indefinite time.

8369. For 10 or 15 years, say?—Yes.

8370. And when you come to a point where you must have more silver rupees for currency purposes you would make the rupee limited legal tender? I mean the existing rupees would continue?—If the country becomes more prosperous, say in 10 or 15 years at the rate of progress she is making, then we can limit the legal tender of the rupee.

8371. At some stage like that you would have to make the silver rupee restricted legal tender. Would the gold notes be convertible into silver?—Into smaller notes. I have suggested notes of Rs. 10 and 5 but not anything for amounts of less than Rs. 5. But I would also like one rupee notes to be issued.

8372. Until the present stock of 90 crores in the Government Treasury has gone into circulation you would keep the rupee unrestricted legal tender?—Yes.

8373. And when the Government find it necessary for them to coin more rupees they should make the rupee restricted legal tender? They will have to because you say they must not coin any more silver rupees or buy any more silver; therefore they must make it restricted legal tender?—That is not necessary. In France silver coins have been kept full legal tender before the War.

8374. Would you keep them full legal tender and still not supply them with silver rupees?—That is not necessary. We can issue rupee notes paper currency.

8375. I see; you won't give them the coin. The existing coin will be in circulation but further demands for smaller fractions of the pound will be given in terms of paper currency?—The Government even now is not bound to give silver rupees. Hereafter on account of the fact that the silver rupee is to be made full legal tender the Government may put the existing rupees which are in reserve also into circulation.

8376. Do I understand you to say that the present rupee currency notes are inconvertible into silver?—They are convertible.

8377. Therefore either the convertibility of the rupee notes will have to be stopped or the Government will have to coin new rupees?—They will have to be stopped.

8378. And therefore silver rupee notes will be inconvertible into silver 10 or 15 years later?—We are bound, the Bank is bound to supply only foreign currency if necessary.

8379. I am talking of internal currency. Therefore 10 or 15 years later you will have an inconvertible silver currency note and an inconvertible gold currency note?—Yes.

8380. And you think that the country can carry on with the inconvertible paper, both silver and gold?—I do not see why it should require any metal at all.

8381. Therefore we have come to the conclusion that if 10 or 15 years later when the 90 crores of rupees which are in the Treasury are all in circulation, Government may come to this inconvertible rupee currency and inconvertible gold currency?—Both full legal tender.

8382. Both full legal tender and both paper currency. Now do you think that is suitable to India?—My view is that it is the best system suitable for all countries.

8383. As an ideal no doubt, but for practical purposes from your knowledge of the condition of the people, from your knowledge of the requirements of the people, do you think that this is either desirable or feasible in the present state of India?—Within 10 years gradually it will become feasible.

8384. You think that within 10 years the standard of education will have improved so much?—Also the acquaintance of the people with the existing currency. The rupee notes previously issued during the War were very popular and did not depreciate and there was no difficulty. I think the people will become accustomed to the situation and be satisfied with the situation.

8385. The rupee notes you say during the War were very popular. Do you think the popularity of the rupee note would have continued if the Government had had to declare the rupee note inconvertible at any stage during the War period?—Inconvertible into rupees?

8386. Yes?—So long as it was legal tender it would have continued to be popular.

8387. So that whether people could convert the currency note into silver coin or not you think the people of India would not have minded it?—Not have minded it. Even silver rupees are not worth their intrinsic value.

8388. But they are worth something?—So long as you are able to provide for the country's currency notes foreign currency for exchange purposes, there is no reason why people should distrust it. At the same time if you divorce the currency system from the Government and entrust it to a State Bank there is no reason why people should not accept the position.

8389. That may be quite correct; I am not challenging it. What I say is does the cultivator and the man at the wayside village understand it? Does he not understand that when he takes a currency note to the Treasury he can get silver jingling there in his hand?—I very much doubt whether the ryot ever takes currency notes to the Treasury.

8390. He goes on passing it on himself?—Yes.

8391. Does not he get change from the sowcar or the village marwari when he wants it?—In notes of smaller denominations. If he has a 100 rupee note he gives him 20 five rupee notes for it.

8392. Exactly. But if you give him a five rupee note he gives you five rupees in silver if you want it?—He may give me instead of that five one-rupee notes.

8393. And you do not think it matters at all whether you are likely to exchange your note for silver coin or not?—It does not matter.

8394. (*Sir Norcot Warren.*) You say in paragraph 17 that "the present Imperial Bank is too weak and powerless for any constructive or originating action." What do you mean?—The Board is there merely to consult; it has not got any other power to influence the bank's policy.

8395. I entirely differ with you; they are not there simply to be consulted; they are there to guide the bank's policy?—I find from the Imperial Bank Act that they are given some power of advice and nothing else. I also had a talk with one of the Honorary Governors of the Bank and he said he could not bring in any changes; so far as the policy of the bank was concerned he was absolutely powerless.

8396. I can tell you you are quite wrong and that the Governor, whoever he was, is also wrong?—That may be; he might not have utilised his power; but I find from the Imperial Bank Act that it does not give full powers to the Board to control the policy of the Bank.

8397. But they do control the policy of the bank; they have full powers and they do control it. If they do not control it who else controls it?—I mean the Central Board consisting of the Governors, that is, the Managing Governors and also the other Governors.

8398. They are the controlling body; if they are not the controlling body who else is the controlling body?—I say that further legislative powers under the Statute must be given to strengthen the position of the Board.

8399. What do you propose? What powers?—Powers more or less similar to the powers of the Board of the Commonwealth Bank of Australia.

8400. Well, I know the powers of the Commonwealth Bank of Australia; the powers that are given to the Imperial Bank Board here are greater than that?—I have not much experience of that.

8401. Just so: you ought not to have written this. You then say the Bank should have an advisory committee of experts in London?—Yes.

8402. They have got that already: they have got three experts on the advisory committee?—That is an advisory committee for the purpose of foreign exchanges.

8403. Never mind what it is there for: there is a committee there for advising the bank, and one of those experts is one of the biggest experts in the world?—What I mean here is that for the purpose of its currency policy, because currency is an international problem, they must have experts in London to advise the bank with regard to the currency policy both internal and external.

8404. I tell you we have got them.—But the bank has not got currency powers.

8405. I say we have got these experts. They are there waiting to be consulted.—Then that satisfies me; that is all.

8406. (*Professor Coyajee.*) Do you not think there is an inherent difficulty in finding a suitable monetary system for a country which has got a large proportion of favourable balances?—It is difficult.

8407. Take a gold exchange standard; there also when there are a number of favourable monsoons following each other, more council bills were sold and India swallowed up the money with a great gulp, as Professor Keynes would say, and therefore there was always the tendency that too many rupees were coined before the war; was not that the difficulty and was not that a constant complaint?—My view is that there would not have been such favourable balances if the volume of country's currency was regulated with reference to the condition of trade alone.

8408. You mean if there had been a gold standard?—If there was a perfect gold exchange standard under which the regulation of the internal currency would be dependent upon the volume of the favourable net balance of trade, there would not have been a favourable balance in the long run; exports and imports including the invisible imports will balance.

8409. True; but whoever managed that currency would have to look to the rise of prices in the country: So that a few favourable monsoons succeeding each other, even two, would raise the prices above what they would be in the ordinary

course?—Yes; being an agricultural country, monsoons do influence.

8410. And if a gold standard was there, the samo would be the difficulty, because supposing we had three or four good monsoons, as we have had during the last few years, gold would be coming in until prices rose very high, and then, whatever the fate of the fourth monsoon, whether it was favourable or unfavourable, the balance of trade would have to be unfavourable because of the height of prices?—Yes.

8411. So that whatever the currency system you adopt for India, whether it is a gold standard or a gold exchange standard, there is an inherent difficulty?—Yes; there is a certain inherent difficulty; there is no doubt about that.

8412. You havo observed that the main demand at present for gold in India is for social and religious purposes?—Yes.

8413. Then, if a gold currency is introduced, not on your lines, but gold currency is actually introduced with coins in circulation, there will be an additional demand for gold, will there not?—Yes.

8414. (*Mr. Preston.*) In paragraph 13, in the beginning you say "The entire currency system of the country should be entrusted to the Imperial Bank which requires to be first converted into a State Bank and a Bankers' Bank." Then you go on to say "Without an efficient Central Bank of the kind described above a proper regulation of the currency and exchange system of the country is impossible." Then you go on to find fault with the Imperial Bank and say that it has no right to work for the profit of its shareholders. Then you say later on "If our proposed State Bank should be made to become a Bankers' Bank, etc.," and in paragraph 19 "In view of the fact that the State Bank in our scheme is made a Bankers' Bank it can efficiently control the internal credit situation, etc.," and then, if I may refer back again where you say that the Bank has no right to work for the profit of the shareholders, what I suppose you mean to emphasise is that the Bank should carry out the duties entirely connected with a State Bank: Is that your meaning? That it should become purely and solely a bankers' bank?—Yes.

8415. That is your idea?—Yes.

8416. Then you quote a system which according to Mr. Tocker exists or is said to exist in New Zealand. Under that system the State Bank there in all its exchange business has to deal with other banks as a banker' bank: is not that so?—I find from Mr. Tocker's article that there are six exchange banks each dealing separately.

8417. Yes; but the central bank deals with the six exchange banks as a bankers' bank?—I do not find that in Mr. Tocker's article. What he says is that the six banks deal separately with foreign countries through London; it is not necessary for any of the banks to transact its foreign exchange business through the central bank.

8418. No; but it is necessary for the central bank to transact its foreign exchange business through the other six banks?—That may be so; I do not know.

8419. Therefore, when you blame the Imperial Bank for making profits for its shareholders, why do you say in paragraph 15 "Besides doing exchange business the Bank should be left in entire charge of Government remittances abroad and empowered to receive all moneys in its behalf both within and without the country." Do you really mean that?—I mean foreign exchange business and it is as a Government department they will have to do it.

8420. You mean really "Besides doing exchange business" for currency purposes?—I mean foreign exchange. The entire foreign exchange of the country should be transacted only through the State Bank; that is what I say,—by the other banks through the State Bank.

8421. But that is for currency purposes?—For all purposes. The transactions between this country and other countries should be transacted only through tho State Bank: other banks would have to go to the State Bank to transact their foreign exchange business.

8422. You are reversing the process which you quote here as being in force in New Zealand?—I quote New Zealand only to show the way in which the matter of exchange is operated.

8423. In New Zealand they have a central bank and the Central Bank manages the currency?—By making this quotation I do not mean to say that these are matters which the bank should manage. I only indicate the way in which our currency transactions should be managed; and with regard to the view that the State Bank should be strengthened, I find in an article in the Economic Journal that the Commonwealth Bank of Australia has been given monopoly powers with regard to foreign exchanges and is the bank through which other banks have to transact that business.

8424. Where did you get that from?—From the Economic Journal for March 1925.

8425. All the Australian banks you say have got to go to the Commonwealth Bank of Australia for exchange?—I remember to have quoted it in the memorandum—the provision that private banks should settle foreign exchange transactions through tho Commonwealth Bank.

8426. So that all the banks in India under your scheme if they had business in foreign exchange, would do it solely and wholly with the Imperial Bank of India, that is your intention?—Yes. That is my intention.

8427. (*Sir Alexander Murray.*) In the very first sentence you say "The country has what may be called a Rupee Standard which is linked neither to gold nor to silver." Now what do you actually mean by that? Do you mean that in the past people dealt with the rupee as being a standard coin irrespective of its relation to gold?—Or silver; it was an inconvertible silver note.

8428. Quite true: but when people dealt with that in pre-war years, did they always look upon it as being one fifteenth of the sovereign?—This does not refer to pre-war years at all; I say under present conditions.

8429. But in pre-war years, what did they look upon the rupee as, if during the recent years they havo looked upon it as being neither connected with gold nor with silver?—In pre-war years there was at least a supposition that it could be converted into sovereigns at Rs. 15.

8430. But Government never undertook any statutory obligation to convert it into gold?—It had no obligation to issue gold coins for silver rupees.

8431. The average agriculturist when he dealt in rupees or dealt in notes, did he deal in the rupee as being $\frac{1}{15}$th of a sovereign?—He dealt with it as $\frac{1}{15}$th of a sovereign, because no contingency arose for him to think over the matter.

8432. But did he link it up with the sovereign in any way?—He had no occasion to feel about it, because there was no difficulty for him in converting it.

8433. Then amongst the reasons that you give for going on to a gold standard is that given in paragraph 8 (iii), where you say that the public opinion is due mainly to political suspicion. What does that actually mean?—The Government of the country is suspected of working, of conducting its currency system, for the benefit of England, the Government of the country is suspected among business circles in the country of managing the currency system to suit the interests of Great Britain. That is the suspicion.

8434. But you have studied the question. Do you also hold that opinion?—I am unwilling to attribute any motives to the Government.

8435. Therefore you don't agree with public in that respect?—I don't say that I don't agree or disagree.

8436. Well, you say also that the adoption of a gold standard is a concession to human weakness and conservative feeling. Now, what do you really mean by that?—In the world people have in the past been accustomed to a gold standard and their conservative tendencies are after all in favour of the adoption of a gold standard and not a managed currency.

8437. Well now, the people of India in the past have not been accustomed to a gold standard and they are very conservative people. Therefore, why do you use this argument in favour of a gold standard now?—Intelligent opinion in this country—not the people of the country who don't know about tho facts but the people of the country who know about the state of things in the other parts of the world, they feel that when other countries have got a gold currency, for us solitarily to possess a silver standard or a rupee standard may lead to the wrecking later on of our industrial and commercial progress.

8438. Now the closing sentence in the second paragraph on that page is that the cost of adopting the gold standard at any future time will increase enormously?—The reason for that is if India should continue to coin silver rupees, the other countries having demonetised silver and having taken firmly to gold, the demand for silver for currency in other countries will be small and the price of silver will naturally go down and the more silver prices go down the more will the silver content of the existing rupees depreciate in value, and also in future if at any time we have to convert the currency of the country to a gold standard, there will be enormous difficulty on account of the country having been flooded with silver rupees.

8439. No, but the country now has got silver rupees and if we go on to the gold standard now, won't these rupees depreciate in value?—The rupees won't depreciate in value because they have to be full legal tender. If the rupees are melted now and sold as silver, they will certainly depreciate in value.

8440. Now, when you go on to a gold standard, whether now or at some future date, you purpose keeping rupees as full legal tender?—We can keep the rupee, the rupee may be kept as full legal tender later on also. And for ten years more if we postpone the adoption of the gold standard.

8441. But what I want to know is why should the expense increase enormously ten years hence more than now?—If silver bullion also is held, if the present state of things should continue, then what I say is that the price of silver is likely to depreciate later on and also we are not sure that the price of gold will remain the same as it is at present. Gold prices may also increase on account of the recovery of the countries which are now weak after the war.

8442. At any rate, you consider that gold coinage is undesirable and a waste?—Yes, from the strictly academic standpoint.

8443. And you are in favour of a gold standard without gold coins in active circulation?—Yes.

8444. And you say under your scheme further issues of currency will be in the form of paper notes backed by a reserve?—Yes.

8445. And you suggest that in future the note issuo will be managed by a bank, either the Imperial Bank or a central bank?—Yes, I say that.

8446. Well now, I just want to find out what the difference between your system and a gold exchange standard system is. Because under your system you are going to have the rupees circulating as full legal tender in the country, the rupee is to be the local currency?—The rupee and also the pound.

8447. Quite true. Then you want to have the note issue in the hands of the bank in future. Then you purpose also consolidating the two existing reserves, the paper currency reserve and the gold standard reserve into one single currency exchange reserve?—Yes.

8448. Then you purpose facilitating international payments by keeping your currency exchange reserve partly in India and partly possibly in London, New York, and Yokohama?—Yes.

8449. And I suppose you expect that the bank will undertake to buy and sell either gold for export or foreign exchange at certain gold points?—Yes.

8450. Well now, if you do all that, what is the difference between your standard and the gold exchange standard?—I may say at once that a gold standard conducted on those lines is necessarily a gold exchange standard, the ideal gold exchange standard. There is after all very thin line of demarcation actually between the gold exchange standard and the gold standard. My grievance against the present system is against Government manipulating the currency. I want that Government as such should have nothing to do with the currency any more.

8451. And who do you want should have to do with the currency?—The bank.

8452. Just one moment. Leave aside who is to look after the currency. You agree that your system in effect is a gold exchange standard system?—Yes.

8453. The only point——?—I will call it a currency exchange standard. It is not exchangeable in gold. In order to facilitate the exchange of currencies the standard exists. It is an exchange standard.

8454. Yes, but the gold exchange standard is a standard that enables you to get rupees for internal currency?—Rupees and pounds also for internal currency, according to my system. Paper currency for internal circulation and foreign currency for payment abroad.

8455. That is a gold exchange system?—An exchange standard, whether it is gold or not. Because all the countries are holding gold, because we hold gold bullion too, we may call it a gold exchange standard. But it is an exchange standard.

8456. Very well. The only point at issue then is that you don't like to see that system controlled by Government. But you are willing to see it controlled by the bank?—Yes.

8457. That is the only difference?—That is not the only difference. The regulation of currency must also be on a principle which the Government is not following now, on the principle of the balance of trade determining the volume of internal currency.

8458. But that will not be automatic. That must be decided by somebody, and you purpose that the body in future should be the bank instead of the Government?—The bank has to regulate it on a particular principle, the principle I am enunciating. It is better that the matter also is put in legislation.

8459. Well, will you please tell us shortly your principle?—I have stated it here, in paragraphs 13-19.

8460. That is where you refer to these exchange things?—And then my principle is in paragraph 19, the last paragraph. "Under the existing system of currency in India the volume in circulation is dependent not on any principle of automatic regulation or scientific management, but on the will of the Government." That I want to avoid.

8461. And in future it is to be on the will of the bank?—Not on the will of the bank but the bank will have to regulate it according to the net balance of trade. To withdraw currency from circulation if there is an unfavourable balance and to the extent of the unfavourable balance, and if there is a favourable balance, to the extent of the favourable balance to issue more internal currency.

8462. Well, the bank will have to do all that?—The bank will have to do that only according to that principle and not according to any other principle as the Government is at present doing.

8463. Well, now, dealing with the bank then, you make certain suggestions here regarding the constitution of the bank?—Yes.

8464. Suggestion No. 1—does the existing Central Board not meet the requirements of your first section? You say: "The appointment of a Board of Directors representing special commercial and industrial interests."—I only say that this is instructive. The Commonwealth Bank of Australia has adopted these things.

8465. Quite true. I want to see whether these things are applicable to India. Is principle No. 1 applicable to the present Indian Board?—Yes, the first is applicable to India.

8466. Well now, does it apply to the present Central Board?—With great respect I must submit that I don't think that the present Board is as regards this representative enough.

8467. Does the present Board not represent special commercial and industry interest?—But it does not control the bank.

8468. No, no. But I am taking these points item by item?—But the appointment of this Board is intended not merely to meet but to control the bank. I want it to control the bank.

8469. But you agree that the present Board is representative of special commercial and industrial interests?—I am not quite clear about the representation.

8470. Do you know how the present Board is constituted—how many are appointed by Government and how many by the shareholders?—I do not remember.

8471. As far as I can see, the present Board already does items 1 and 4 at least of that list, and No. 2 you suggest they should do in future?—No. 3 is also a matter for arrangement; so that in effect only 2 and 5 remain to be given to the Bank.

8472. Yes, but you said to Mr. President that you propose that in future the Exchange Banks will not do exchange business with London except through the Imperial Bank?—Yes.

8473. But is it not the other way about, that the Exchange Banks do the business and the Imperial Bank is not allowed to do that?—Yes.

8474. You think that should be reversed in future?—Yes. That will facilitate the way for stabilizing internal prices.

8475. *Chairman* (*Sir Reginald Mant.*) Mr. Ramaiya, the Commission is very much obliged to you for your interesting memorandum and for the evidence which you have tendered.

(*The witness withdrew.*)

TWENTY-SECOND DAY.

Wednesday, December 30th, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman.*)

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER, Mr. A. AYANGAR } (*Secretaries*).

Mr. RAM KUMAR JALAN and Mr. KASTOORMAL BANTHIYA, representing the Marwari Trades Association, Calcutta, called and examined.

8476. (*Chairman.*) Mr. Ram Kumar Jalan and Mr. Kastoormal Banthiya, you are good enough to come here this morning to represent the Marwari Trades Association of Calcutta?—(*Mr. Kastoormal Banthiya.*) Yes.

8477. Are you the Chairman of the Association, Mr. Kastoormal Banthiya?—I am a member of the Association and this gentleman, Mr. Ram Kumar Jalan, is the Vice-Chairman of the Association.

8478. Your Association has been good enough to furnish us with a memorandum* setting out their views?—Yes; we sent later on an additional note.

8479. We have also received from you a further communication making two corrections by way of omission in your memorandum?—Yes, in paragraph 11

8480. Shall I address my questions to you in the first place, Mr. Kastoormal Banthiya?—Yes.

8481. Will you please tell us something about the nature of your Association? In the first place, what is its membership?—200.

* Appendix No. 41.

8482. Secondly, what is the nature of the interests represented in the Association?—It represents all sorts of merchants, piece-goods merchants, importers and bullion dealers. It is a general body to protect the interests of the Marwari community in trade and commerce.

8483. And these members are all engaged in trade in Calcutta?—Yes.

8484. When was your Association founded?—30 years ago.

8485. You tell us it represents merchants; import merchants?—Import, export and all kinds of merchants.

8486. And bullion brokers?—Not bullion brokers, but bullion merchants there are.

8487. Exchange brokers?—Yes; there are some exchange brokers.

8488. Any manufacturers?—Yes.

8489. What do they manufacture?—They have got cotton mills; they have got jute mills; some have got collieries.

8490. Bankers?—It is the chief business of the Marwari community.

8491. For the benefit of the members of the Commission who are not so intimately acquainted with these matters, could you state very briefly the nature of the banking business conducted by a typical member of your Association?—Generally we deal in bills of exchange, local bills of exchange. We buy in up-country or sell bills of exchange in up-country or they can buy at our Bombay or Calcutta Office. Everywhere we have got branches. We have got branches in Cawnpore, Bombay, Calcutta and several other places. They are also in cotton districts. There we do banking business. We also deal as sowcars to the cultivators. We finance all the crops. We give them advance before sowing.

8492. These bills of exchange to which you refer are internal bills?—Yes; hundis.

8493. Therefore, the business of your typical member is to finance the crop from the cultivator to the point of export?—Yes; to the ports of export, Bombay and Calcutta and also on piece-goods and imported articles.

8494. You finance them from the port to the cultivator?—No; from here to up-country.

8495. Turning now to the memorandum of your association, we understand that you come here to-day, Mr. Banthiya, to explain the views of your Association and not your personal views?—Yes; the views of the Association only.

8496. I will now, if I may ask you a few questions to elucidate whatever seems to need elucidation in very full memorandum. Your proposal, generally speaking, is that there should be a gold mohur of the same fineness and weight as the British sovereign, with rupees serving the function of subsidiary coins at the ratio of 15-1. You propose the establishment of a gold standard, meaning a system of currency with a circulation of gold, and that the rupee should be made convertible into gold?—Yes, and unlimited legal tender.

8497. And unlimited legal tender; but that, after the gold standard has been effectively established, the amount for which the rupee is legal tender should be limited to Rs. 100?—Yes.

8498. You further recommend that the note issue department of the Government should be handed over to the Imperial Bank, subject to certain conditions; and these I think are the positive recommendations contained in your memorandum?—Yes.

8499. Now let me turn to your memorandum and ask you one or two questions just to test your arguments. In paragraph 5 you say that "people are bound to regard with increasing suspicion a policy (substantially the existing policy) which compels them to receive the rupee as the equivalent of about 50 per cent. more than its real value." Now just to test that, let me ask you why you distinguish the rupee from the note. The existing policy compels them to accept the notes at a great deal more than 50 per cent. of their real value; but there is no suspicion about the note, is there?—Notes are all expressed in rupees. As the bullion value of the rupee differs from the current value, the suspicion comes there. Our notes are all expressed in rupees. So there is nothing said about the notes.

8500. That is undoubtedly true; but I do not think it quite overcomes my difficulty, which is, if people really dislike accepting anything at less than its real value, that is its intrinsic value, why don't they object to accepting the notes just as they object to accepting the rupee?—If they convert the notes, they would be given rupees which are exactly 50 per cent. of their value.

8501. But you say they object to the rupee?—Yes, because its intrinsic value is not equal to the current value.

8502. You agree that people do accept notes freely?—They do accept notes; that is what we have already said in our note, that one rupee notes can be introduced. There is no question about the notes; but it is the question about the convertibility into the coin.

8503. As regards its intrinsic value, you rightly say that the note is convertible into the rupee. Then the note is really on no better footing as regards intrinsic value than the rupee, is it?—But there it depends upon the confidence of the people. When they want to exchange the notes they would get the value of the note which it represents.

8504. It is rather difficult, because you say they have no confidence in the rupee but they have got confidence in the note because it is convertible, which seems strange, does it not?—As it is it is more convenient to convey notes in large amounts.

8505. As a matter of fact does it not really indicate that if one is to look for the basis of confidence in a token coin of any sort, one must look to something else rather than the intrinsic value of the token. That is quite a misjudged basis as an estimate of the confidence which the token inspires?—I do not quite understand it.

8506. Let me put the question in another form. Is not what inspires confidence in a token coin not its intrinsic value but the certainty that its value in relation to gold will be stable?—What we here want to say is this: that when the standard *de jure* and the standard *de facto* are the same people would become confident that they are handling the thing which it actually represents; and in the case of these token rupees etc., they naturally say that the rupee circulates for 16 annas though when they sell it in the bazaar they would get 9 or 10 annas at the most.

8507. What do you mean by a standard *de jure* or a standard *de facto*?—Standard *de jure*, it is a legal standard; it can be paid in liquidation of debts to any amount; and *de facto*, in fact the rupee is worth only 9 as. if it is sold as bullion.

8508. Then I understand that you do adhere to the opinion that it is of essential importance for a currency that the actual coin or medium of circulation should never differ in its intrinsic and its extrinsic value?—That is it.

8509. Then really, Mr. Banthiya, what is to be said about the note circulation of the world?—The note circulation has got a backing and they are convertible into the standard coin. There is the confidence that whenever they want they could get the coin.

8510. Precisely. What you must, in fact, regard is not the difference in the intrinsic and extrinsic value of the actual circulating medium but the circumstance whether it is convertible with certainty into gold?—That is all right. But at the same time the masses who are illiterate do not know all these things; they only weigh the coin they handle.

8511. In paragraph 5 you say: "To succeed for any long time in maintaining a currency whose legal and real values are so widely different is tantamount to gambling on the ignorance of the people; but since India is becoming more enlightened every day, even that ignorance cannot help matters much or long." Are you arguing there against the existence of any token currency at all?—The subsidiary coin will always be token. That cannot be avoided. But when the standard coin is a token coin, in that case, this holds gold.

8512. And your argument is that you can avoid this gambling only by making the token currency, whatever it may be, directly convertible into gold for circulation?—Token currency must only be used for subsidiary coin, not for standard coin. That is what we mean.

8513. What about notes?—Notes will always be convertible into standard coin, that is gold.

8514. You must make your token currency (and a note is a token just as much as anything else) convertible into gold for circulation?—Yes.

8515. Have you considered in this connection the present system of currency in Great Britain?—Yes, I have seen it.

8516. The present system of currency in Great Britain would not be in accordance with your theoretical requirements, would it?—How?

8517. Because the note is not convertible into gold for internal circulation?—That is only for the time being but it was before the War. It was only to get sufficient gold that they have done that. It was suspended during the War.

8518. When you say it is only for the time being, you are expressing no doubt an opinion which you have formed?—That is not an opinion but what I have read about it. I know it is only for the time being because it was not so before the War when notes were convertible for internal circulation also into gold.

8519. I think perhaps we need not go into that as that is a matter upon which we can get more direct evidence. Supposing you had such a currency as that of Great Britain at present, where the note, which is the principal token currency, is convertible under legal obligation not into gold for circulation but into gold for export only, does that not secure the gold value of the unit of internal currency, and thus, in your words, "effect a standard where the legal value and the real value are identical and assured in identity"?—In what part do we say that?

8520. Shall I repeat the question?—Yes, please.

8521. Does not the present system of currency in Great Britain, where the tokens, in our case the notes, are convertible not into gold for internal circulation but into gold for export only, by assuring the gold value of the unit of the token currency effect a system in which, in your own words, "the legal value and the real value of the token currency are identical and are assured in identity"?—Then in that case it will be the same as the gold exchange standard and the people would be handling only rupees, that is the only thing; and the confidence of the masses will not be restored in that case.

8522. I am trying to get a little deeper than that to your own analysis of confidence. You point out that confidence depends upon having the legal and the real values the same, and I was asking you whether, under such a system as our British system, you do not assure that the legal and the real value are the same. What is the opinion of your Association about that?—I do not follow what exactly you want to bring out from that.

8523. You argue here that confidence in a currency depends upon its legal and its real values being the same. I put to you the case of the British currency, where you have the notes convertible into gold not for internal circulation, as you recommend for India, but into gold for export only. I suggest that that assures the gold value of the note, and that by doing so it is in accordance with your requirement that the legal value and the real value should be the same?—It is only for foreign payments in that case but not for internal circulation. The internal coin would be only the rupee. In that case it will not be the same thing as its bullion value, that is, gold.

8524. Now let me ask you a question on paragraph 7. I will come later to what you say about the ratio which you deal with more fully. About half way down you say: "We would, therefore, have at present the 15 rupee mohur. It would offer less attraction for the purposes of absorption." Correct me if I am wrong, but I rather gather from your proposals in this paragraph that you do contemplate that when gold is put into circulation it will at first be absorbed and pass out of circulation. Is that so?—That is not what we mean. We have assumed that there will be some absorption as there is at present in every country. There will be some absorption for industry, for ornaments or whatever it may be. Assuming all that we say that when we establish the gold standard there might be some absorption of these gold mohurs but later on we indicate that it won't exceed, the absorption of sovereigns will diminish the absorption from the retail dealers of gold bullion, one counterbalancing the other.

8525. Later on you attempt, I think, to put an estimate upon the amount?—In paragraph 10 we have done that. The net result would be the same.

8526. Nevertheless, although you are indifferent to this absorption you do propose in this paragraph to try and prevent it, do you not?—Which paragraph?

8527. Paragraph 7. I understand that the purpose of this proposal for a gradually diminishing gold coin is in order to prevent the absorption of gold coin at first. You propose first of all a 15 rupee mohur, and then, when the gold position is firmly secured at 10 rupees, the 5 rupee coin. I understand the purpose of that is to discourage absorption at first?—Yes that is so.

8528. You argue elsewhere that the absorption is a matter of indifference?—Yes.

8529. Of course it might occur to one to ask, why then trouble to take these precautions to prevent it?—No, we have assumed that there will be some demand for gold for ornaments, etc., required by our social customs, and when we have a standard gold coin then instead of buying gold bars they may take these mohurs, etc., for that purpose.

8530. In paragraph 10 you express a very strong opinion that the amount of rupees in hoards in the country is very much less than is sometimes supposed. You say: "The story of the hoards, like that of the rope trick, has been repeated time and again by men who pretend to know things about India." I may say that this is a matter upon which there is some conflict of evidence before the Commission, so that it would be of interest if you could expand your reasons for this opinion, on the basis of the experience gained by your Association in the conduct of its various businesses?—About these hoards?

8531. Yes?—We always come in contact with the cultivators who are very poor, who are half-clad and who do not get even food enough to eat. How then can they hoard all these things? We find on their body, if any at all, only such ornaments as are essential for their home-life. How can they be supposed to hoard. That is the only thing.

8532. Do you come in contact equally with the better-to-do classes, the landowners—(I shall probably get the names wrong if I try to refer to them)—Rajas and Rulers of Native States and so on? Do their affairs come equally within your experience?—Some of our members do come in contact with such persons. That is why we have expressed the opinion that "excepting the Nizam we do not know of any State having any large capital uninvested at its disposal."

8533. What, in your belief, is the active rupee circulation of the country? Have you been able to form any estimate of that? By active rupee circulation I mean the rupees actually passing from hand to hand?—That we have not estimated but in the reports we find that it is 200 crores or something like that.

8534. If the rupees in active circulation were some 200 crores, how do you account for the balance of rupees coined and issued?—There are some in reserve in treasuries, some in the Imperial Bank and other places.

8535. Yes, there are those. Any other occupation for the rupee?—What can it be?

8536. That is just the question, what can it be?—It is only a medium of exchange, it cannot be used for anything else, it cannot be used even as a store of value.

8537. The argument is that if you make all allowance for rupees melted down, rupees in the treasuries and in the reserves, taking even as high a figure as 200 crores for rupees in circulation, there is still a very large number of rupees unaccounted for.

You account for some of them by allowing for leakage across the frontiers, but even when you have made all allowances of that sort you are still left with a large balance, and by some authorities it is asserted that that balanco is held up for the purpose of serving as a store of value by various classes in the country, and, in particular, by the Native States. The estimate which is given to us of the rupees which may be so held up is between 100 and 150 crores. What is the opinion of your Association with regard to that?—The association has not made any estimate of these things. But these rupees cannot serve as a store of value. If it is stored, we can only store it for purchasing some time after; that is all.

8538. I do not quite follow why the rupee cannot be held as a store of value. One may think it is imprudent for the uninstructed to hold the rupeo as a store of value, but why cannot it be held? As a matter of fact cases have come to our knowledge. You yourself refer to the case of the Nizam. What man has done, man can do?—That is true; but our Association has not made any estimate for that; I cannot say.

8539. I do not quite follow your argument in the middle of paragraph 10, where, talking of the possible demand for gold, you point out that for a period of 12 years India has not absorbed more than £60 millions and so on. I do not quite follow what the relevency of these figures is in this connection, because what we are seeking to estimate in this paragraph is what additional demand would result from the free offer of gold in conversion of rupees for currency. If that be so, does it illuminate the matter at all to refer to the amount of gold that has been absorbed for the purpose of ornaments or as a store of value in the past?—We have written this thing to estimate the demand for gold for absorption purposes, and we arrive at this conclusion that there cannot be a greater demand than 45 crores, whether in the shape of gold mohurs or bullion.

8540. Forgive me if I say that I do not quite see the relevency. There are two things to consider, are there not? There is the demand for gold for ornaments and for hoards in order to save up. That is one thing. That, you point out, has been very fully met during the past years, and there is no reason to think, as I understand you to argue, that that would be increased?—Yes.

8541. Now there is another thing, and that is the new demand for gold in substitution for notes and rupees in circulation and for rupees in hoards, and that is quite additional and independent of the demand for ornaments and for the saving of gold in the past or in the future?—No; that will not be the case. When we have a gold standard then whatever gold there will be in hoards or ornaments could be available for the purpose; because people will have confidence that whenever they want gold they can get it from the Government.

8542. Let me ask you about that on the basis of your wide experience. You have pointed out yourself in your memorandum, as so many have pointed out to us, that the principal requirement for gold is by way of ornaments for the endowment of members of the family on marriage and so on. Is there any reason to suppose that gold required for this purpose will be brought for coinage and conversion into currency?—That is exactly so; when they want it for business purposes they would do it.

8543. They can do so now, cannot they?—It cannot be converted into currency.

8544. They can sell the gold to a broker?—The rates differ in the bazaar; they can sell it dearer than they could get currency for it from the Government.

8545. If there was any real need to convert the ornaments into currency now, it is only a question of giving a fraction of the profit to the broker in the bazaar to get currency for them?—It is not so much about ornaments; whatever absorption there be whether for ornaments or for hoarding as it is called, that will be available for currency in case of gold standard.

8546. I want you to try and convince me, if you can (because indeed at the moment I need conviction), that gold which has been absorbed for the purpose of endowing a lady on her marriage in the form of ornaments and so on is ever likely to become available for currency?—There is likelihood in times of need, because people do pawn and do all these things; in that case why should they lose interest and why pay high interest to the sowcar? They could get currency; at present there is no chance of that; it depends upon education; when they get the education they will know the benefits of investment.

8547. Further down in this paragraph you say: "it would not be unreasonable to think, therefore, that when Government would be bound to supply gold coins in exchange for silver notes, people will have more confidence and will not rush to the currency office to get their silver converted into gold." This is, of course, a very important consideration. Is it the opinion of your Association that that increase of confidence and education of the uninstructed people will be brought about by the mere publication of the fact that gold can be had in exchange for silver?—That is exactly the point; this will restore some confidence in the people; and if efforts are made for educating the masses it will help a good deal.

8548. Would it perhaps not be more natural to suppose that, in order to effect this education and increase in confidence, it will be necessary that people should actually to a considerable extent in the first place touch the gold, take it out, and find that they can get it by bringing their rupees to be converted and so on?—Education will help them to invest in profitable channels; that is another thing; but handling of gold always restores confidence in the ignorant public who know only bullion and things like that. When we handle a thing which it actually represents, it is bound to restore confidence in the ignorant mind.

8549. I want to make sure that I understand your answer. It is, then, your opinion that the people would have actually to handle the gold in the first place in order that they may gain this confidence?—They may in the first instance; but the rupee would be in circulation among the masses; that would be exchangeable into gold and so that will restore confidence, that whenever they want gold for any purpose, whatever it may be, they could get it; in that case they are handling actually gold and not the rupee; that is the actual value of the coin in circulation.

8550. If in order to bring about this result of increase of confidence it is necessary, as you now tell me, that the people should actually handle the gold, that means in other words that the rupees will be brought for conversion?—Yes.

8551. And that gold will go into circulation?—Yes.

8552. At the bottom of the page you say: "We think gold Mohurs to the extent of 45 crores of rupees will be quite sufficient to meet the above-mentioned demand." What is the basis of that estimate?—These are the figures which we have taken and approximately we have put it that during the 12 years we have absorbed nearly 90 crores of rupees worth of gold, and even of this a large part was for melting purposes; on this assumption we have taken it at 45 crores, not more than that.

8553. This estimate is the estimate of the gold which will be required for the conversion of the outstanding rupee, is it not?—We are considering the demand for gold for making ornaments and these things. That is the first point: and we say "If we take the figures from the year 1901-02 to 1912-13 we find that during a period of 12 years India did not absorb more than £60,000,000 of sovereigns or an average of £5,000,000 a year. Calculated at Rs. 15 to a sovereign the total absorption comes to rupees 90 crores worth of gold coins or rupees 7½ crores worth

of sovereigns per year. This absorption is not such as to frighten the Government. True that the times have much changed since then. But it should not be forgotten that the Government under the old regimè of the gold exchange standard was not bound to supply sovereigns in exchange for rupees."

8554. Do I understand that you base your estimate of the amount of gold which will be required in order to discharge the obligation to convert rupees into gold on the amount of gold which has been absorbed of late years in the country for the purpose of ornaments and savings?—Yes.

8555. That appears to me to be at first sight an unsound basis, because the two purposes are totally different, as I have put to you already—that the amount required for ornaments and hoards casts no light upon the amount that will be required for the conversion of the silver rupee. Is there anything more that you can say to clear that up?—The gold that our people absorb has been mostly for making ornaments and hoarding purposes. The rupee would be converted only when people want to spend it for gold purposes; and we estimate that for all these purposes it will not exceed more than 45 crores.

8556. Let me put it to you as clearly as I can in order to bring both our minds together. You have had from year to year in the past a requirement for gold for ornaments and for hoards. That requirement will continue in the future?—Yes.

8557. You are adding to that now a fresh requirement for gold for converting outstanding rupees. It appears to me that you have provided us really with no basis for an estimate for that fresh requirement?—That is exactly the thing. By having a gold standard, whatever gold was absorbed by India will come out because the difficulty of getting gold will be removed; people whenever they want gold would get it as desired.

8558. Then your estimate should be this, on your own basis. You estimate first of all the amount that will be required for the conversion of rupees, and you deduct from that the amount that will come out from bangles and hoards. Is that not according to your own basis which you have just now given us?—At the same time there may be some demand for ornaments; that is why we have calculated it roughly as not exceeding 45 crores from previous statistics.

8559. What have you estimated as the amount which would pass into circulation out of various forms of accumulated gold?—We have not made any estimate of that thing; we have only made estimates for the probable absorption of gold or the demand for gold in case the gold standard is established.

8560. It appears to me that, on your own basis, an estimate of the first quantity is essential to an estimate of the second; that is, in order to arrive at your estimate of the amount that would be required under the gold standard, you would have to estimate the amount that would pass into circulation out of hoards. That, I understand, you have not estimated?—No.

8561. Now with regard to one or two details of your calculation. In paragraph 11 you say that we have 90 crores of silver in the reserve out of which you propose selling about 40 crores. Why only 40? Because that is all you want to complete the total of 110 crores?—There would be rupees in circulation as subsidiary coin for small change; we would require rupees and we don't want new rupees to be coined.

8562. What would you do with the other 50 crores of silver in the reserve?—For small change; the notes may be converted into rupees for small change.

8563. You would keep those in the reserve to supply the needs of the country for small change?—Yes, that might be.

8564. How long do you think it would be before the country would absorb 50 crores additional rupees for small change?—That may be—whatever rupee stock might be at present, that may take 20 or 25 years.

8565. In the meanwhile the Government would be losing the value locked up in the 50 crores, whatever the bullion value of that is?—We cannot avoid all these things.

8566. You could avoid it by selling out the whole 90 crores?—In that case what would we do about the small change that we require?

8567. You have rupees being brought for conversion into gold. You agree that there will be some brought?—There will be some brought if they are in the hoards.

8568. So that at first there will be an actual contraction of the rupee circulation?—No. Then gold will come into circulation in substitution for rupees.

8569. That will diminish the demand for rupees?—Yes.

8570. You estimate that that 40 crores will realise 30 crores in gold?—Yes.

8571. Do you think that is a safe estimate if you consider the effect of the dethronement of the rupee from its position as unlimited legal tender and of the actual sales of the 40 crores? Might not that affect the silver market?—That is true, but we have already proposed an import duty on silver and this 40 crores of rupees is to be sold in India. In India the prices, owing to the import duty and the restriction of foreign import altogether, the market won't be depressed in India; and it is not to be sold all at once but by degrees.

8572. What, in your opinion, will be the effect on the public mind of the restoration of the import duty on silver, particularly with a view to the effect of that upon the value of silver ornaments and so on held in the country?—They will appreciate in value with the imposition of the import duty.

8573. You do not think there will be any political difficulty in the restoration of the import duty on silver?—No. Besides it is rather essential to put an import duty in that case.

8574. You delete your suggestion for the introduction of a nickel rupee?—Yes.

8575. I see you only go so far as to say that the depression resulting from the giving up of the policy of minting silver rupees and of selling silver would be counteracted to a considerable extent by imposing an import duty on silver at the rate of 4 annas per ounce. I gather from that that you do not estimate that it would counteract the whole depression?—No. We have supposed the whole of the 40 crores of rupees are to be disposed of in India with the imposition of the import duty by degrees. That won't affect the market in any way, in India specially.

8576. Then you would delete the words "to a considerable extent" in the sentence "we think that the depression could be counteracted to a considerable extent by imposing an import duty on silver at the rate of 4 annas per oz."?—There is no need to delete that. That will be the effect of the import duty. The market won't be depressed as it is feared it will be by the dethronement of silver.

8577. Well, perhaps we may take the words as they stand. Then you delete the words "The Government's decision to stop all silver coinage will always hang like Damocles' sword on the head of the silver market"?—Yes.

8578. You continue to recommend that Government shall stop all silver coinage?—Yes. When we stop silver coinage altogether, that is a fact and not a decision.

8579. That is a fact. Ought I to ask why you deleted those words?—Because that is not the case. When the gold standard is established, silver would not be required for coinage purposes.

8580. But you agree that it will have some effect on the silver market?—That is true.

8581. Perhaps the phrase "will always hang like Damocles' sword" is too picturesquely violent?—The sword is already hanging. But once Government decides.

8582. I see. Now I understand. It is because this is a single act and the effect of it will not continue.

Then you say: "All the same, we think that India would rather face this loss (*i.e.*, from silver sales) than tolerate the constant invisible taxation imposed upon it by a debased currency." Why is it constant? Let us follow it out. The profits from issuing rupees go into the gold standard reserve?—Yes.

8583. That is, we might agree, an asset of some value?—Yes.

8584. That is something to set against the invisible taxation?—Yes.

8585. When, as at present, the gold standard reserve is considered to be sufficiently large, then the interest on the reserve and presumably fresh profits would go to the relief of revenue, would they not?—But the gold standard reserve and all these things.

8586. I am just questioning the word "constant." The point is this that, admitting that the issue of a token currency may be called an invisible taxation, or rather I should prefer to put it a forced loan from the people, are there not, as a matter of fact, countervailing entries on the other side of the account in the form of relief to revenue enuring for the reduction of taxation or at any rate the prevention of its increase?—But that has not been the case.

8587. Is it not the case now that the interest on the gold standard reserve goes to the budget?—It is being utilised for *ad hoc* securities, created securities of the paper currency reserve.

8588. But do you not recognise the circumstance that the payment of the interest on the gold standard reserve into the general revenues of the country counterbalances the invisible taxation of the issue of the rupee?—It does not.

8589. At the end of paragraph 11 you say: "We have indicated how the gold standard reserve and the gold and sterling securities portion of the paper currency reserve might be made to yield us a supply of about 82 crores out of this"?—We explain at the beginning of this paragraph. "We have first of all the gold standard reserve which contains £40 millions gold, or converted at 1s. 4d. exchange 60 crores of rupees." And then there comes in the paper currency reserve. We have got sterling securities of 57·11 crores which converted at the rate of 1s. 4d. would give us an extra 21·66. That amounts to 82 crores, both these things.

8590. What you have got to supply, according to your own calculations, is 45 crores of gold to replace 45 crores of rupees in absorption?—Yes, 45 crores of rupees in absorption.

8591. And you propose in effect to get that out of the present reserves?—Yes, by calculating them at 1s. 4d.

8592. My difficulty there is this. The present reserves are held for the purpose of maintaining the internal and external convertibility of the token currency of the country in its two forms, notes and rupees, and they are no more adequate for that purpose. In future the reserves will have to serve both that purpose and the purpose of securing the convertibility of rupees into gold. How can reserves, diminished, as you propose to diminish them, fulfil not only their present liabilities but also the additional liability? Would it not seem more natural that you would have to increase your reserves rather than diminish them?—No, that won't be the case. When fresh rupee coinage is stopped, the present stock of rupees will be absorbed for subsidiary coinage and there will be this reserve which will be sufficient for our convertibility.

8593. It seems almost too good to be true that, by accepting an additional liability, that is the liability of the conversion of rupees into gold, you are enabled actually to reduce your reserves?—That won't be the case. Rupees will remain in circulation and they will be absorved as subsidiary coinage. There will be no fresh demand for gold in that case.

8594. But you are allowing, are you not, for a fresh demand of 45 crores?—That is we annually import gold as a favourable trade balance. And so long as there is a favourable trade balance we will import gold. And that fresh gold would also help the absorption demand and all those things.

8595. Undoubtedly the normal imports of gold will continue, and I suppose the normal demands for gold for the purpose of ornaments and so on will continue?—Yes, that will be so, but there will be no extra demand for gold for establishing a gold standard.

8596. You do not feel any difficulty about this result that, concurrently with the acceptance of a fresh liability, you are reducing your existing reserves?—We are not reducing, we are simply strengthening the paper currency reserve for its conversion.

8597. But you are allowing for the passage of 45 crores out of the reserve, and you are going to get that from the existing reserves: is not that so?—We have indicated here on page 7 that of the 110 crores that we have put in the paper currency reserve 65 crores will be from the old reserve that we have got at the valuation of 1s. 4d. and only 15 crores are to be brought from the gold standard reserve—the remaining would remain as a reserve for the conversion of the rupees, whatever they may be.

8598. The balance would remain, but it would be a smaller balance?—Yes.

8599. That is the point, that the balance would be a smaller one which would remain to fulfil the existing purposes for which the reserves are held?—At present we have 40 millions of gold in the gold standard reserve, and then we will have 45 crores of rupees worth of gold in the gold standard reserve at the new valuation of 1s. 4d.

8600. You further come to the conclusion in paragraph 18 that you do not think "any extra requirement of gold for the purpose of establishing a gold standard with a gold currency would be so big as to cause any appreciable effect on the world prices." That is on the basis that you can get all the gold you want out of the existing reserves?—Yes.

8601. May I put to you a supposition, which is not that of your memorandum, that an appreciable additional quantity of gold would be required to undertake this fresh obligation of converting the rupee into gold?—There is in fact no need for such a supposition.

8602. But I am putting it to you as a supposition just to see whether I can get your opinion as representing a body of traders whose business it is to watch the course of gold prices and so on. Let me put to you a further supposition, that the amount would be very substantial, that it would be as much even as 100 million sterling of gold. What, in your opinion, would be the effect upon gold prices of an additional requirement for India of gold to about that amount?—There cannot be any additional requirement. We have got a favourable trade balance. That must be liquidated in international money that we will accept as a gold standard, so there will be no extra demand. Our favourable trade balance must be liquidated by those who purchase our commodities. As far as the convertibility of our rupee is concerned we have already got sufficient gold in the reserve.

8603. You would rather not, in fact, make the supposition at all?—Not at all.

8604. Or follow out its consequences?—Yes.

8605. With regard to the answer you have just given me that you can get all the gold you want because India has a favourable balance of trade, that favourable balance of trade is settled at present partly by the home payments, partly by the importation of gold which is required for the uses of the people for ornaments and so on, and I think we have come to the conclusion that that require-

ment is likely to continue?—The present importation of gold will go into currency purposes also.

8606. You assume, then, that the requirements of gold for the uses of the people for ornaments and so on will cease?—Yes, they will diminish as time goes on.

8607. Is that a safe supposition?—Yes, it is; as the masses become educated, that is bound to increase; social customs are changing every day. It depends upon the progress that we make in education.

8608. For how many centuries has that requirement of the Indian people for gold continued in the past?—That cannot be said. They can be revolutionized very early if people get chances of education; every community has now organizations to discourage all these things.

8609. Do you think this process of education, by which people will get cured of their thirst for gold, will be a swift one?—Yes, that is bound to be.

8610. You think it will be a swift one?—That I cannot say, but so far as it seems to me from the present progress, it is bound to be.

8611. Do you think it would be safe to base any estimate as regards a matter of such vital importance as currency policy upon the assumption that the people of India will be rapidly educated to no longer requiring gold for the purposes for which they required it in the past, for ornaments and so on?—We cannot say anything about the period, what time it will take, but as we see from the present progress and from our bank balances, the bank deposits are increasing, and they are a sufficient indication that people are getting accustomed to investment.

8612. Might not a critic turn round at this point and say: if it is the case that the people are being educated in the habit of investment at the encouraging rate to which you refer, why is it necessary to undertake what is admittedly an expensive policy as regards gold circulation if the process is already going on. What need is there to incur further expense in order to hasten the process?—There is no further expense. We simply want our currency to be put on a sound basis, that is all.

8613. I rather understood from your memorandum, as when you say that India would rather face this loss, the loss from silver sales, that you do assume that there would be expense in the process?—But that loss is only for the sake of putting our currency policy on a sound basis, and that, no nation can grudge, if it desires to put its currency on a sound basis for the future.

8614. But a loss is a loss, for whatever purpose it is incurred. A critic might put it against you at this point: why, if the people are already learning the habit of investment and doing without gold, should you incur a further loss for the sake of establishing a fresh educative method, that of the circulation of gold?—This loss we cannot avoid if we want to put ourselves on a sound basis, and that cannot be large.

8615. In paragraph 18 you say: "We think therefore that when exchange is brought back to 1s. 4d. gold and the price of gold has risen again to Rs. 24 per tola, a good quantity of gold could be purchased even in this country." What would it be purchased with? What would they buy the gold with?—It is only for the augmentation of currency that the gold will be required; people who want more currency for the trade demand would tender that gold and get currency for it.

8616. They would buy the gold with rupees; they would redeem the rupee with gold?—Yes.

8617. When they bought gold with the rupees, there would be more rupees outstanding, which there would be a liability to redeem in gold?—Yes.

8618. That would not improve matters, would it?—The gold that we have got in the country owing to these low prices, that will come back when it reaches Rs. 24 per tola.

8619. Then you say a little further down: "Regarding the decrease of revenue caused by the loss of seigniorage and interest on the extra capital required for purchasing gold and such other incidental items." "Purchasing gold" seems to me to imply some different arrangement. Does this imply that capital will have to be borrowed in order to buy the gold?—No.

8620. What does "interest on the extra capital required for purchasing gold" mean? That seems to indicate that you contemplate borrowing to buy gold?—That is not exactly the point that we want to make. As we have already indicated, there will be no fresh demand, there will be no need of buying gold, but supposing there is any, then in that case the loss of interest we must bear.

8621. You are then contemplating in this passage that the Government will have to borrow somewhere?—That is a farfetched assumption.

8622. I am afraid you do not quite agree with this passage in the memorandum, do you?—That is true. We suppose that there will be no fresh purchase of gold required, but supposing that is essential then in that case it will be a very small amount.

8623. Now we come to the question of the ratio. I think you say that any other ratio than 15 to 1 would be a deliberate violation of old contracts. What would you say in reply to a critic who said that any other ratio than the existing ratio of 1s. 6d. would be a deliberate violation of new contracts?—People knew very well that 1s. 4d. was the stable rate, and it had ruled for the last quarter of a century and that people were trying in the Assembly to put the old ratio on the Statute Book. 1s. 6d. was not on the Statute Book. How could they take it for granted that this will be maintained.

8624. You think, in fact, that everybody ought to have agreed with your Association that 1s. 4d. was the right rate, and they ought to have done, what,—to have abstained from making contracts?—That is not the thing.

8625. Or to have insured themselves against loss in consequence of the prevalence of the 1s. 6s. rate until it was restored to 1s. 4d.?—That is not the point. It is only with regard to the argument about 1s. 6d. that the contracts entered into will be vitiated in that case, we say that there was no reason to put this argument altogether. We will say that there was no reason to put this argument. People based their contracts at 1s. 4d. for the last 25 years and that must be the proper argument in favour of 1s. 4d. rather than 1s. 6d. because it is a question of a short period, for the last year and a half.

8626. Since the 1s. 4d. rate existed after the war, many rates have been prevailing, have they not? Recently 1s. 6d. has prevailed. During that time the business of the country has had to be conducted, and contracts have had to be entered into, at varying rates, lately the 1s. 6d. rate? Is it the intention of your Association that no regard at all should be paid to the interest involved in those contracts made at rates other than 1s. 4d.?—We have looked to the stable rate that has ruled These temporary rates cannot be taken as a basis for fixing the ratio.

8627. In paragraph 23 you say: "The reason why we are for the 1s. 4d. rate to-day is that, however unreasonable it might have been in the beginning to adopt such a high rate, when once it was adopted and placed upon the Statute Book it became henceforth a rate which could never be altered except for the gravest of reasons." If that argument is sound, is it not really an argument for the 2s. rate, because the 2s. rate has been adopted and placed upon the Statute Book?—Now this related to the quotation that is given from the Fowler Committee's Report. At that time 1s. 3d. was the ruling rate and 1s. 4d. was only a temporary rate on which the whole Statute was changed.

8628. But if this argument is soundly and sufficienly stated, does it not now apply, with more

force to the 2s. rate than the 1s. 4d. rate, because the 2s. rate has been adopted since the 1s. 4d. rate and has also been placed upon the Statute Book?—It has been placed upon the Statute Book but the market rate has always been much below that rate.

8629. Then you say that this argument must be abandoned, and that we must look at the market rate and not the rate which is adopted and placed upon the Statute Book?—That is, we must look for a rate that has ruled for a considerable time and we must fix that rate; that is my opinion.

8630. If we are to look at the market rate and not the rate adopted and placed upon the Statute Book, will that argument not really support the rate of 1s. 6d. which is now the market rate?—This present rate has been brought about by a deflation of currency.

8631. So was the 1s. 4d. rate, according to your own argument?—No; that has ruled for 25 years without any manipulations.

8632. So that really we must abandon this argument here and come back to your original argument that the 1s. 4d. rate should be adopted because it ruled for a long time?—Yes, that it is.

8633. In paragraph 24 your Association says: "But it is noteworthy that even four good monsoons in succession have added nothing to the purchasing power of the people. The reason of this has to be found in the appreciated exchange. The agriculturist could not obtain the price for his produce which he could otherwise have done." Might your critic not say: "true the agriculturist obtained a smaller price for his produce, but equally the man who was selling to the agriculturist all that the agriculturist buys, cotton cloth and so on, could not obtain the same price for his produce from the agriculturist?" In short, the agriculturist, although he got less for what he sold, paid less for what he bought, and therefore his purchasing power was the same as before?—No; that is not the thing. The agriculturist has to pay interest to the sowcar, has to pay land revenue and so on which are all fixed in rupees, while he gets less rupees for his produce. So he saves less.

8634. That is another consideration. How would you meet the contention that, as regards that portion of his income which he used for the purchase of goods, the purchasing power of his income was increased by the rise in the rupee?—The purchasing power depends upon the savings. When the savings are less, how can the purchasing power increase?

8635. The purchasing power depends upon the amount saved and also upon the real value of that amount. If the real value of that amount is increased, then there is a benefit, is there not?—Yes; but the commodity value of the rupee is so much lower.

8636. Precisely. In the same paragraph you say: "As is well known, the trade balance is generally in favour of India, and under the circumstances to force her to part with her surplus produce at cheaper rates cannot certainly be in her interest." That means that she gets less for her exports?—Yes, it is exactly so.

8637. Following out this line of thought, does it not also mean that she pays less for her imports?—But the consumption of imports, that is, cloth for instance, is much less. He consumes the local produce, local cloth and all these things. The import of foreign cloth is only of finer counts, which is consumed by the richer classes. The cultivator has to do with the coarser cloth which is mainly Indian.

8638. Is it then the opinion of your Association that the price of imported goods, such as cotton cloth, has no effect at all upon the price of goods, such as cotton cloth produced and consumed in India?—Yes, it has some effect, but not to that extent so far as the cultivator is concerned. It is immaterial to him. He has to look to the price of the cotton cloth which is available here, that is, the local produce.

8639. Finally, does the general fall in prices not affect goods produced and consumed in India as much as imported goods?—It does.

8640. After a period of adjustment?—It does; but they cannot be adjusted all at once. Here for instance, cotton industry has gone down; our prices here have not gone down as the foreign goods' prices.

8641. Can you give me any figures of the relative fall in the price of cotton goods, manufactured and consumed in India, in comparison with the nearest class of imported cotton goods?—That I am sorry I cannot give at present.

8642. Those are the figures necessary to support your later contention, are they not?—I cannot give them at present.

8643. Has your Association considered those figures?—That is the general impression with regard to the experience that they have of the agriculturists with whom they come into contact every now and then.

8644. Your opinion is based upon a general impression?—Yes, upon personal experience of members.

8645. Lower down in this paragraph, when dealing with the question of the effect of a reduction upon the national budget and Home Charges, you say: "Those who advocate 1s. 6d. on the ground that it will lighten the burden of Home Charges might well be asked as to who is it that pays the Home Charges. Is it not the producer." I suppose it is rather the tax-payer, is it not?—It is the producer.

8646. One cannot locate one source of revenue rather than another. It is the tax-payer in general?—But the land revenue is the maximum amount of tax.

8647. "Is it not the producer who maintains India's favourable balance of trade and enables the Government to redeem its liabilities every year from the money realised in foreign countries in exchange for his produce? And it is he who has to accept as a result of a higher exchange so many fewer rupees for the produce he has to sell." Now let us turn to the other side of the picture. Supposing the exchange value of the rupee is reduced, that will mean an additional burden in respect of the Home Charges, will it not?—Yes.

8648. We have had an estimate in evidence that the burden resulting from a fall from 1s. 6d. to 1s. 4d. would be 3 crores. Do you agree with that estimate?—That might be; it used to be met before the war, when it was at 1s. 4d.

8649. At any rate you may take the estimate from me that three crores additional would have to be found to meet the Home Charges. That would have to be found by the tax-payer, would it not?—For the sake of three crores.

8650. Shall we deal with the question, that an additional three crores would have to be found by the tax-payer, would it not?—Yes.

8651. As you told us, the producer is the principal tax-payer?—Yes.

8652. So that that will be an additional burden of 3 crores falling mostly on the producer?—I cannot say anything about the financial Budget and other things as to how they are adjusted or made. When in pre-war times the rate was 1s. 4d. and they used to make them at that rate I do not see why it would now require that finish taxation; but I have not studied these things, and cannot give any opinion.

8653. In paragraph 26 you say: "The 1s. 4d. exchange by raising the price of gold in this country would be inducing its present holders to release large supplies on the market and enable the Government to effect its purchases without being inconvenienced by short supplies." Can you

enlighten us as to whether there are, in fact, large supplies of gold in the hands of dealers of various classes which might be thus released?—In paragraph 17 we have already indicated that there have been huge imports of gold during the last 5 years or so.

8654. The question is whether there are large supplies actually in the hands of dealers which might be released on the market?—By this we mean that whatever we have imported and that has not gone into circulation as it ought to have been at the old rate will come on.

8655. As a matter of fact, perhaps you can tell us, from the aquaintance of the members of your Association with this class of business, whether there are or are not big supplies of gold in the hands of dealers which have not yet found their way to the purchaser?—How can there be? They are not going to lose their interest on that.

8656. To your knowledge there are no such supplies?—No.

8657. (*Chairman.*) That completes the questions which I have to ask you. Perhaps, Mr. Banthiya, you will be so kind as to deal with any supplementary questions which my colleagues may have to ask you.

8658. (*Sir Reginald Mant.*) Mr. Banthiya, it appears from your memorandum that the main reason why your Association recommend a gold standard with a gold currency is because what you call the exchange standard lends itself to manipulation?—Yes.

8659. Supposing it were possible to deviso means for preventing any such manipulation by perfecting a gold exchange standard would that objection fall to the ground?—No. We want that tho system may be made automatic, that is to say, anyone who needs currency should get what he wants.

8660. Yes. If the system could be made automatic without the introduction of a gold currency, would you dispense with your recommendations for a gold currency?—No, a gold currency is essential for that system because people are only concerned with the coin in circulation, what they get.

8661. I was asking you for a moment to assume that a gold currency was not necessary to secure the automatic system which you desire; if you will assume that for a moment?—But how can that be possible in that case.

8662. Your reply is that——?—It is an essential thing.

8663. That you are unablo to make that assumption?—Yes it is essential to have a gold currency.

8664. Would you say that the system in force in England at present is subject to manipulation and to the objections which you have raised here?—It was during the War period. It is only now that they have put the thing on this basis, making it a moral obligation that people must use as far as possible notes and not gold coin. That is with regard to a population which is far more educated than we have in India.

8665. Do you consider that the system at present in force in England is subject to manipulation?—It is only temporary. It was during the War.

8666. I am asking whether it is now?—That I cannot say. I have not studied the system

8667. You are not aquainted with the system in force in England?—No.

8668. Now you have pointed out in paragraph 18 that large quantities of gold have recently been imported by Indian speculators in expectation of realising higher prices later on, and you say that India has imported more gold than she could possibly consume. You said in reply to the Chairman that the dealers are not holding that gold. Well, can you tell us who are holding it? What people are holding that gold?—Well it might be somewhere upcountry. We cannot say who are holding the gold. But please remember that during the war period people could not get gold and the large imports that have taken place during the past 3 years have been due to that restriction.

8669. But you say India has imported more than she can consume, more than people are prepared to buy?—Yes.

8670. Well it must have stuck somewhere; somebody must be "left with the baby" as they say; somebody must have that gold?—That might be so; we cannot say who has got the gold; it might be upcountry.

8671. It has passed out of the hands of the dealers?—Out of the hands of the dealers.

8672. With whom you are aquainted?—Yes it is not in the hands of the dealers.

8673. Then presumably there are stocks of gold in the hands of local goldsmiths in all the bazaars?—That cannot be much, I mean with goldsmiths in the bazaars.

8674. Well on your own showing there is a lot of surplus gold in the country?—The goldsmiths have gold only for making ornaments, whatever they may be.

8675. But what class of people have your dealers sold it to?—From here we send it upcountry. In upcountry it is sold in parts, one tola or two tolas at a time and in that way it is purchased by the masses; it is not sold in lump quantities there. It is sold in retail quantities of one tola, two tolas or half a tola.

8676. But what class of poople upcountry have your dealers sold it to?—Retail dealers.

8677. Well presumably anybody who wants gold now can buy it because on your own showing there is really a surplus of gold in the country. Anybody can get gold who wants it?—Yes.

8678. Why do you say that it is necessary in order to secure confidence for Government to undertake an obligation to supply gold. If anybody who wants gold can buy it surely that should be sufficient to give confidence to people who think they may want to purchase gold?—That is quite different from what we say. When we make it obligatory on the Government to pay gold in exchange for currency, that is different from buying it in the bazaar because a person may not be able to get it at the price that he wants; but here there is nothing of price; it is a fixed thing. He thinks that whatever he has got in money that is all gold and whenever he wants gold he can get it. But here the rupee he has got to purchase gold with, is not the same as gold.

8679. I do not follow that "the rupees he has to purchase gold with is not the same as gold?"—I mean to say if he has to buy gold from the retailers or whatever source it might be he has to pay rupees but when we make our rupees convertible into gold or say we adopt the gold standard, then in that case he thinks that what rupees he has got that is all gold; when he wants gold he will go to the Government and demand gold and get it, rupees or notes or whatever it may be.

8680. But he can get it now in the bazaar?—Yes but the price fluctuates, as in War time he had to pay 34 and now he gets only 21.

8681. Well he can buy it for Rs. 21?—But he paid Rs. 34 and now he gets only 21; that is nearly half the price, a loss of 50 per cent.

8682. Your point is then that if Government undertake the obligation the price of gold would be stabilised?—Would be fixed, yes.

8683. Now I want to ask you a few questions about your proposal to sell 40 crores of silver. You expect to realise 30 crores for it, is it not?—Yes.

8684. That is Rs. 75 per hundred tolas. Can you tell us what is the present price of silver?—71 or 72; approximately 71, I do not know exactly.

8685. Don't you anticipate that putting such a large quantity of silver on the market will reduce the world price of silver?—It will have an effect on the world price of silver.

8686. And you expect to get Rs. 75 a hundred tolas by means of this 4 anna duty?—Yes that will enhance the price by Rs. 10, this 4 anna duty.

8687. Rs. 10 a hundred tolas?—Yes.

8688. And by exchange?—It will be also Rs. 10, something like Rs. 10 or 12, an increase of Rs. 10 per hundred tolas approximately.

8689. The present price is Rs. 71 you said; so you really expect world prices to be reduced only by Rs. 20 per hundred tolas. Isn't that what it comes to? The present price is 71. You would add 20 on account of the duty and the exchange. You expect to realise 75. Therefore you anticipate that the world price will be reduced by Rs. 16 per hundred tolas?—Yes it might be that, we cannot say exactly, but we anticipate that if we sell silver slowly in India in that case we could realise that amount.

8690. But you propose to sell the whole amount in three years, do you not?—Three or four years; that is our idea; we estimate that we will be able to realise Rs. per hundred tolas.

8691. You would maintain the duty of four annas during those three or four years?—I would maintain that for all time.

8692. In paragraph 26 you say that the reversion to 1s. 4d. would have the additional advantage of averting a considerable loss in the selling of silver stock. Can you explain how reducing the value of the rupee will avoid loss in the sale of silver?—This silver has to be sold in India; by the imposition of an import duty we will bring the price up by ten rupees.

8693. Leave out the import duty for the present?—This rate of 1s. 4d. would increase the price by 12½ per cent. from the present rate of 1s. 6d.

8694. But it will increase it in depreciated rupees?—The price realised for the silver will be greater.

8695. Only the rupee price?—The world price in the world market would also be more.

8696. That is what I cannot understand, how you get more, a bigger price in the world market by reducing the value of your rupee?—At present the rate for silver is say, 31d. If we sell silver in the London Market at 31d. we get a certain amount of rupees at the rate of 1s. 6d.; and if we sell at the same rate, but convert the rupee at 1s. 4d. naturally you would get more rupees.

8697. But the purchasing power of those rupees would be no greater?—Here we are not concerned with that; we are only concerned with the gold value of the rupee and if we fix the rate at 1s. 4d. we get more gold than at 1s. 6d.

8698. Who will sell you more gold for your rupee?—At 1s. 4d. the rupee would be worth more gold than at 1s. 6d.; we sell silver at the present rate in the London Market at 31d., and that is to be converted into our standard coin which we suppose to be a rupee of gold; at 1s. 6d. we would get some amount of rupees and at 1s. 4d. you would get 12½ per cent. more than that.

8699. You would get more rupees, but you said just now that you would get more gold?—We are taking the rupee as representing gold if we adopt the gold standard.

8700. (*Sir Reginald Mant.*) I am afraid I am unable to follow you: I do not think I will trouble you any further on that point.

8701. (*Mr. Preston.*) Mr. Banthiya, you told me Chairman early in your examination that you had personal knowledge of the life and habits of the agriculturists of India?—Yes.

8702. I suppose in their daily life their purchases of food-stuffs are quite small. You also described them as being very poor people and ill-fed, and in paragraph 10, by way, I suppose, of emphasising your knowledge, the statement is made: "The fact that in India most of the business transacted is in very small amounts should be a sufficient guarantee against undue absorption of the gold coin." Could you give us any idea of what, from your personal knowledge of the life of these people, you would put down as the weekly expenditure, say of a family of five, a father and mother and three children?—Say 25 rupees a month or roughly twelve annas a day.

8703. Say a rupee a day: that would cover their food-stuffs and such clothing as they wanted?—It would.

8704. I suppose these people live, as it has been described to us, in lakhs of villages and thousands of towns, spread generally over the country, and at the outside a rate of a rupee a day would cover them in all their household expenditure?—Yes.

8705. Therefore, taking an expenditure of that nature it would hardly be possible, would it, to invent a gold coin of any denomination which would be of any value to them for their needs?—This gold coin does not depend upon the poverty or anything of that sort.

8706. It would not appeal to those people or in other words for general utility purposes a gold coin would be practically useless to them?—It may be useless, but we want a gold coin to make our currency system stable.

8707. I shall come afterwards to that; let me find this out first; I am trying to follow out the statement you make here, and as you have been good enough to tell us what from your personal knowledge constitutes the daily expenditure for a family of five, it naturally follows that, taking it at a rupee a day, a gold coin for all general utility purposes would be useless?—Yes.

8708. Then in paragraph 6 you say: "We want a gold currency, that is the gold coin, as the visible symbol of a gold standard." It is a mere sentimental matter? It is only a symbol? The fact that you have got a gold coin and you can either put it in a case or keep it in a village so that the people can see it and say "here is a gold coin; you are not going to us it because it is of no value to you, but there it exists and it forms part and parcel of our gold standard." Previous to this you say "We advocate a gold currency not because we want the gold coins to take the place of notes or rupees—we would have as much gold as possible in the treasury rather than in the pockets of the people": so that really speaking, whilst your argument may be that the natural corollary to a gold standard is a gold currency it may be an equal argument to prove that a gold currency which you yourself have admitted in so far as the agriculturist of India is concerned, who forms 70 per cent. of the population, would be quite useless?—Yes, they may not use that gold coin.

8709. Another point: you say in paragraph 18: "We do not think that any extra requirement of gold for the purposes of establishing a gold standard with a gold currency would be so big as to cause any appreciable effect on the world's prices." Then you later on give us a statement of how you are going to convert such of the reserves as we have got now into gold for the purpose of providing the necessary gold for the backing of our notes. You are aware that the gold standard reserve and the paper currency reserve, the sterling portion of it, are both invested in England?—Yes.

8710 Therefore the first step would be to sell those securities?—They are short term securities; they will mature soon.

8711. They have got to be sold all the same?—We do not want them to be converted into gold all at once; by and by as they mature they will be turned into gold.

8712. Yes; but some of them acccording to the statement are for over three years; you allow for three years only?—Three or five years or whatever it may be.

8713. You go further than that, five years if necessary?—Yes.

8714. Or a little longer if it was really necessary?—Yes.

8715. You would go up to whatever period may be necessary?—No, not whatever period; we say three years; if three is not sufficient, say five years.

8716. Supposing some of the securities we have run for eight or ten years, then you would be willing to wait for eight or ten years rather than go and upset the security market by forced sale of these securities?—That is not so; we will have all gold securities in the paper currency reserve; those securities which do not mature even within these three or four years or during the transition period may be transferred to the security portion that we will always keep in the paper currency reserve; there is no need for a forced sale.

8717. You do not want to convert all your securities into gold?—As they mature.

8718. They will naturally go into gold funds as they mature?—Yes.

8719. Then when they go into gold funds, out of your gold funds you have got to acquire gold?—We get gold out of it as the sterling securities mature; we get gold in payment for them.

8720. Ultimately when you turn the gold funds you have received as the equivalent of the sale of your securities, you will turn these gold funds into gold; but have you also thought that in the process of turning those gold funds into gold (the amount in the gold standard reserve is 40 millions and the paper currency reserve is over 20 millions, making a total of between 60 and 70 millions altogether), have you thought what the result of shipping 60 to 70 millions of gold from London would have on the world's interest markets in forcing rates of interest up and thereby forcing sterling prices down and in its result affecting all your prices here in India?—That is not the exact point here. We have already said here "We would suggest to Government to follow up their announcement by offering to buy unlimited quantities of gold first at 1s. 6d. and then at successively lower rates until the old rate of 1s. 4$\frac{3}{16}$d. has been reached." This does away with all this fear.

8721. You have first to sell your securities, then when you get funds in the bank, then you turn your funds into gold and then you ship it out to India; but if you are going to ship 60 to 70 millions of gold you are naturally going to force up interest rates?—But they are not to mature all at once.

8722. Let us extend them over a period; what I want to get at is, are you prepared—to pay for the expenses, to stand all the consequences which such an action might bring about in order to gain your end?—What other consequences can there be?

8723. The effect on ultimate prices in India?—What?

8724. What do you think, if gold prices are forced down by an appreciation in the interest rates, would that not have an effect on your prices in India?—No; in fact we will have stable prices by having a gold standard.

8725. If world prices are forced down by an increase in interest rates, it would not have any effect on prices in India?—It will have; Indian prices cannot remain unaffected.

8726. And they could not be stable? They would fall?—But the effect would not be much because there would be no extra demand for gold.

8727. But you are quite prepared to stand such consequences?—We must for the sake of soundness of currency.

8728. For gaining your end?—Yes.

8729. (*Sir Alexander Murray.*) I think you said to the Chairman and to Sir Reginald Mant that the dealers in India were not holding much gold, nor were the goldsmiths. Now you make the statement here in paragraph 18 that "we think in fact that recently India has imported more gold than she could possibly consume." And then you say: "It was not surprising if Indian speculators imported huge quantities of gold in expectation of realising higher prices later on." And you say lower down, that Government's purchases can be made in India. I think you replied to that effect to Mr. Preston just now. Well, how is Government going to purchase that gold if it is not in the hands of the dealers and not in the hands of the goldsmiths. Where is it to come from?—From the country. Those who have purchased this gold from the dealers will tender it, as we got sovereigns and francs during the war period on the declaration of Government's policy.

8730. In the meantime, in what form is the gold being held? In bullion, in bars, or as ornaments?—That we can't say. It may be in bullion or in ornaments or in sovereigns even because sovereigns too were imported.

8731. Do you believe that speculators have bought a lot of gold lately with a view to realising it later on? I see in paragraph 26 you say that "a 1s. 4d. exchange by raising the price of gold in this country would be inducing its present holders to release large supplies on the market."—Yes.

8732. Well, you say in one place that speculators have bought and you say that if exchange should drop to 1s. 4d. a great quantity will be released. So presumably speculators are holding gold with a view to realising profits when exchange drops to 1s. 4d.?—What we mean is that this cheaper rate induced larger purchases of gold from outside, and if the rate was further reduced in that case they would have imported more gold. Because there was no other means. This gold imported could not have been converted into coin. It remained there and when the gold standard is established at 1s. 4d. in that case this gold will naturally come out.

8733. Then you suggest lower down in paragraph 27 that Government should begin buying unlimited quantities of gold at 1s. 6d., right down to 1s. 4$\frac{3}{16}$d. Do you think these speculators will take to selling at 1s. 6d. if they know that Government will ultimately come to 1s. 4d.?—Government should fix the value only for the present. It should express its willingness to purchase at a certain value just now. If people know this the price won't be increased.

8734. But if you tell them that it is going to come to 1s. 4$\frac{3}{16}$d., that will increase the price?—But it will not be known to them by what time it will come. When people know that they can convert their gold into currency in that case they would naturally convert it. Because there will be no other means for supplementing currency.

8735. No, but you say Government should buy unlimited quantities of gold?—Buy for purposes of currency, not for storing.

8736. One other thing. You say here, the Chairman has already referred to it, in paragraph 24, that "even four good monsoons in succession have added nothing to the purchasing power of the people." But a great lot of more money has come into India as a result of these four good monsoons. For instance the pre-war average of exports of Indian merchandise only totalled 219 crores. During the war, when prices were high, they only averaged 216 crores per annum. Well, in 1922-23 there were 299 crores worth exported; in 1923-24 there were 349 crores worth exported; in 1924-25 there were 385 crores worth exported. Even allowing that prices are on a higher level than they were in the pre-war days, people in India are getting far more money paid for their goods than they were getting in the pre-war days?—No. But we have to consider the commodity value of the money that they get.

8737. But the commodity value today is relatively higher than it was before?—But we are getting less commodity for our rupee at present.

8738. Yes, but you are getting very much more rupees. You are getting 385 crores of rupees today when in the pre-war days you were getting 219 crores for the goods?—I don't exactly understand it.

8739. Now, one other thing. In paragraph 21 you say that Government fixed the rate at 1s. 4d. "turning a deaf ear to all protests from the Indian mercantile community and decided upon a ratio which was both unnatural and unreal." And yet in paragraph 23 you say "the rate worked wonderfully well for nearly 20 years before the war." Well, is it not

possible that, if Government fixed the rate at 1s. 6d. that it would work equally well?—Well, it will lead to a good deal of dislocation.

8740. But we are at 1s. 6d. now?—No. That is only by stringency of money, by constant manipulations. That is not the natural rate. That has been artificially made.

8741. But the prices now are in keeping with the average prices ruling in the other gold standard countries, such as the United States of America and the United Kingdom. The average level of our prices is the same and that is one of the features of a gold standard that it keeps prices more or less uniform in all the countries on the gold standard?—Yes.

8742. Well, if we are on that basis now, it looks as if 1s. 6d. was a suitable basis?—No. It is only temporary, only for one year. We must look to the stable conditions that existed for a long period and fix our rate accordingly.

8743. (*Sir Rajendranath Mookerjee.*) A large quantity of gold is generally used in India every year for ornaments, as admitted by you. Now these ornaments are given to girls at the time of their marriages in the form of a dowry. What becomes of these ornaments when they become widows when they cannot use the ornaments or when they die?—Well, they go to maintain the widow when she has no other support.

8744. You mean the ornaments are sold; they go on the market?—Yes.

8745. And after their death, what happens to the ornaments?—After their death, the heirs use them or they may sell them.

8746. So that the demand for ornaments in gold must gradually decrease?—Because that gold goes back again—Yes.

8748. (*Chairman.*) There are other ladies being married, and I suppose they want fresh ornaments.

8748. (*Sir Rajendranath Mookerjee.*) They get these. If the mother dies, she leaves it to the daughter. Of course, every year there is a fresh demand but not so much.

8749. (*Chairman.*) Mr. Jalan and Mr. Banthiya, we are very much obliged to you for your full assistance this morning.

(*The witnesses withdrew.*)

TWENTY-THIRD DAY.

Thursday, December 31st, 1925.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER, Mr. A. AYANGAR, } (*Secretaries.*)

Professor K. T. SHAH, called and examined.

8750. (*Chairman.*) Professor Shah, you are a B.A., a B.Sc., a Barrister-at-Law, and Professor of Economics in the University of Bombay?—Yes.

8751. Is that in connection with any particular college of the University?—It is in connection with the post-graduate work of the University.

8752. You have been good enough to furnish us with your views on the reform of Indian currency in the form of a draft Act* with explanations. I would ask, if I may, whatever questions suggest themselves in order to elucidate any points that may seem to require elucidation. Your proposals are of a radical nature, and are supported by contentions in respect of the principal provisions. I see that you proceed upon the general basis of the transfer of control from the Government to the Imperial Bank?—Yes.

8753. Now we come to clause 1 of the Act. Would this clause hold water legally? Might it not be contrary to treaty rights as between the Native States and British India?—I have shown that it may be difficult to carry out such provisions, but I have also shown that there are *quids pro quo*, and then you may be able to arrange by special treaties again for a provision of this nature.

8754. It might amount to a good many *quids*, might it not?—It might be difficult, I quite grant that, but it is not impossible; and if I recollect aright, some years ago there was a committee appointed by the Government of India themselves with their nominees and also nominees of the Native States which have their separate mints to come to some such arrangement as this.

8755. With regard to clause 2, is it possible for a Legislature exercising Sovereign rights to delegate from its own authority in this manner?—In the first place the Indian Legislature does not exercise fully Sovereign rights. I mean it is not a Sovereign legislature in the sense that Parliament is.

8756. Let me frame my question a little more carefully: is it possible for a Legislature exercising some Sovereign rights to delegate from those Sovereign rights which it does exercise?—I do not see anything impossible. What I would suggest, however, is that in view of the seriousness of the question, and in view of our experience, it is of the utmost importance that we should have some guarantee of currency legislation being looked upon with greater seriousness than it has been.

8757. Your next proposal to which I wish to call attention is that you propose to decimalize the Indian currency system?—Yes.

* Appendix No. 42.

8758. On the following grounds, among others, that "the sovereign is not quite the medium of international payments, since London is gradually losing her pre-eminence as the financial centre of the world, and if that centre comes to be definitely located in New York, the rejection of the proposal for the assimilation of the British Currency system with the American system may quite possibly appear as a short-sighted piece of the usual insular conservatism of the British people." Then you propose that there should be a mint, and that the mint should be in Bombay in view of the commercial importance and administrative convenience of Bombay. Your next positive proposal is that the currency system should be organized on the basis of a gold standard, and that we understand to be the standard which you work out in the subsequent sections of your Act?—Yes.

8759. Clause 6. Why do not you allow the Mint to make any charge for the cost of coinage?—I think the cost would be so small that it might well be borne by the State, something by way of this cost in the length of period allowed to the Bank or the Mint for coining bullion and then I do allow the cost.

8760. It is so small, it might just as well be borne by the private person?—It might leave room, I fear, for the charge, if it is allowed at all to be levied, being used as a source of income for making the mint self-supporting or something of that kind, whereas I would rather throw it on the State so as to make a perfect parity between the bullion and the coin value.

8761. I find a very important reservation made in your argument throughout, and that is this: tell me if I am over-stating it. I understand that you look for the successful fulfilment of your plan upon the establishment of an efficient banking system and the use of it by the Indian people as an essential condition precedent?—Yes.

8762. In explanation of clause 11, you say: "Unless we have a sound system of credit organisation, we shall be no nearer the freedom from the danger of hoarding, whether we have a traditional gold standard, or the scientific exchange standard," and there are subsequent passages to the same effect?—Yes.

8763. Tell me what your intention is there. If this is an essential condition for the successful working of a gold standard, do we understand that you would wait for the introduction of that standard until the banking system and the banking habits of the people are more highly developed?—I would take them simultaneously, side by side. Of course the gold standard I should have at once, and the same Act which introduces the gold standard should also be framed so as to improve the banking institutions and credit organization on the lines I have suggested.

8764. If we have a gold standard before we have an improvement in the banking organization, then, until we do get that improvement, we shall be no nearer freedom from the danger of hoarding?—Yes, but I would make it quite clear that I should not wait for introducing an effective gold standard till we are able to spread our banking organization in the manner I desire to spread it.

8765. What do you mean where you say that the "people are too poor in India to be able to hoard gold"? What has become of the gold that has come to India?—That gets into the hands, I take it, of the bullion dealers, the professional dealers in gold and silver; but the people at large, the general public, the average Indian, is too poor, judging from his average income, from his average wealth, to be able to hoard gold.

8766 The bullion dealers do not buy gold for the fun of the thing, to hold it; they want to sell it again, do they not? To whom do they sell it?—Some gold does get into the shape of ornaments. The ordinary customs and habits of the richer classes of the people do take up some of the gold for the purposes of ornaments alone; and the rest must be in the hoards of Native States or bullion dealers and so on.

8767. You seem to me to attribute a curious function to the bullion dealer of hoarding gold on his own account. Is it not natural to suppose that he only buys it to sell?—I do no think all the gold gets into the hands of the bullion dealers. Quite a good proportion, I cannot say exactly how much, is in the shape of ornaments, which the habits and customs of our people require to be in gold; another such proportion is possibly with the Native Princes.

8768. It is no doubt loose phraseology to refer to those ornaments as a hoard?—Yes.

8769. We now come to an important paragraph which may perhaps be looked upon as the essential point of your argument. In the last paragraph but one under clause 11 you say: "The suggestion that India should be educated in the use of cheap forms of the medium of exchange would be easily carried out by an increase in the notes, which, if made payable in gold as suggested here, will inspire greater confidence than has been the case hitherto." How do you propose to effect this increase in the notes?—I do not exactly mean an increase in the total volume of notes in circulation, I mean a greater habit of using notes which are made payable and convertible in gold.

8770. That is to wait for the education of the people in the use of notes? You are not suggesting any form of Government action by the currency authority?—No, except in the form of improved banking habits, as I say later on.

8771. Next you say: "With a strong gold reserve in the country, naturally resulting from the use of gold as currency, husbanded by the help of a proper banking system, we shall provide the best remedy against the periodical troubles in exchange." How does that strong gold reserve naturally result from the use of gold as currency?—If gold is in currency, and if the banking organization is developed in the way I am suggesting, then in every period of stringency, by the action of the banks in contracting credit facilities, they would be able to attract gold into the banks.

8772. How does that naturally result from the use of gold as currency?—Because gold is in the country, it can be attracted at once by such means.

8773. Gold first goes out into circulation and then it is attracted back into the bank?—Yes, by the use of banking pressure in the shape of the bank rate and so on.

8774. I suppose a critic might say, "why not keep the gold in the bank in the first place if you want it"?—I say it is much better if you do not in the first instance, in the initial period of the change, keep it in the banks but in the country.

8775. I still do not follow why the increase in the reserve can be looked upon as a result of having gold in circulation. As long as it is in circulation is it not in the reserve?—I follow it by saying "husbanded by the help of a proper banking system." It means, of course, that it need not necessarily, in the first place even, get into circulation.

8776. Not necessarily?—And that a proper banking system would see to it that it remains in or returns to the banks.

8777. It does not result from the use of gold as currency; it results from the proper banking system?—If you read that sentence with those words, there is no difficulty.

8778. If I read the sentence without those words I should find some difficulty. Then you continue: "This gold in circulation would not, as was assumed by the Commission of 1913-14, be at the expense of either rupees or notes, but will rather be an addition to the centralised Bank Reserve, ready mobilised against possible contingencies." Do you consider it a fact based on experience that gold in circulation can

properly be looked upon as part of the reserve, and that it is readily mobilised in times of crisis?—If you see these words there they seem to be somewhat inconsistent. "Gold in circulation" and then "ready mobilised in the bank." What I really mean is that it would be ready or mobilised eventually in the banks.

8779. Then it is not in circulation?—Not in active circulation; I make that improvement.

8780. We must really omit the reference to the words "in circulation"?—Yes, that is true.

8781. You return to the charge in your next sentence, which runs: "The ultimate support of exchange must be the kind of currency in general circulation." There again I am confronted with the same difficulty?—Somewhere it must be in the country, but not in active circulation in the sense that it is in the hands of the people.

8782. There again it is not the circulation that counts?—No.

8783. It effects a substantial facilitation in my apprehension of the paragraph. "Gold in circulation in India, under existing conditions, can only displace rupees, as the notes would be more convenient than rupees." Is that beyond the possibility of controversy? Might it not be said that, at first at any rate, the demand for gold as the more desirable medium for currency might tend to replace the use of notes? What would you say to that?—If the notes are made payable in gold, then whatever may happen in the first flush of the change, I think eventually the greater convenience of the notes is bound to assert itself; and the gold will therefore in the long run not displace the note but the rupee.

8784. But you would not put it beyond possibility that there might be an initial replacement?—Initially, for a short time perhaps, not beyond possibility.

8785. "Above all," you continue, "the gold standard and gold currency will help to stabilise prices." What is the maximum degree of stabilisation which can be attained by this method? It is, is it not, the stabilisation of internal prices in India in relation to world gold prices?—Yes.

8786. You seek no greater degree of stabilisation than that?—No.

8787. I understand that you are not a supporter of the idea of managed currencies?—Not at all.

8788. Supposing we can imagine an exchange standard which effects a stabilisation of the value of the internal currency in gold, that would also achieve the same result, would it not, of stabilising internal prices in relation to world gold prices?—I am not so sure that it stabilises effectively or actually even in relation to world gold prices.

8789. I am assuming that the exchange standard has stabilised the gold value of the rupee?—I see, fixing it.

8790. If you make that assumption, then it would have the same effect in stabilising internal prices, would it not?—Yes.

8791. "The risks of depreciation to capital investment would disappear." Equally if you make the same assumption, then that risk would disappear also, would it not? That depends upon the stabilisation of the gold value of the internal currency?—Yes.

8792. "The need to maintain large balances in England, which is such a prominent feature of the existing system, will also disappear, and our money-market be freed from its periodical stringency." Is the need to maintain balances out of the country an essential feature of the structure of a scientific exchange standard?—If payments have to be made constantly in a foreign centre, you necessarily must maintain balances there.

8793. Let me direct your attention to such an exchange standard as that which now exists in England, where the obligation undertaken by the currency authorities is to sell gold for export. That does not argue the maintenance of any balances in a foreign country, does it?—No.

8794. So that it is not an essential feature of all gold exchange standards?—No, not of all gold exchange standards but under the conditions of India, it is bound to be so.

8795. Will you explain that, Professor?—It is quite simple. India has necessarily to make large payments every year regularly by way of Home charges. India has also to receive large payments by way of trade balances. Those two streams are in mutually contrary directions; and if and in so far as the object of the exchange standard is to economise gold, as also to minimise the movements of gold to and fro, they have hit upon the system of council bills and by the maintenance of reserves in the balances in the money centre of London they are able to achieve their double object.

8796. May one pause to emphasise that there is a sharp distinction between the two purposes of economising the use of gold for currency and minimising the movements of gold?—You can make that distinction.

8797. Supposing that you picture an exchange standard, such as has been put before the Commission by some witnesses, in which the currency authority in India would undertake the obligation to buy and sell gold, selling gold for export only, just as the Bank of England does, then your international payments would be settled substantially in the same manner as they would be settled under your gold standard?—Yes.

8798. Under those conditions, there would be no necessity, would there, for keeping a balance in a foreign country?—Except for the payments to the Secretary of State. There would be still wanting some, I mean, for Home charges.

8799. He has to keep his working exchange balance, but that is different from the balance of the reserve?—Certainly.

8800. In section 18, I will refer to the main points which call for comment, (*b*) and (*c*). You say: "The third follows as a natural consequence of the first," that is, the limitation of the rupee as legal tender follows as a natural consequence of the general demonetisation of silver?—Yes.

8801. It does not follow as a necessary consequence, does it, Professor? It may be an additional point of policy, but the one does not necessarily argue the other, does it?—If you want to demonetise, the best way is to fix the legal tender limit of the rupee.

8802. It is one measure which contributes to that end?—Yes; you can also limit the supply; that is another.

8803. I will only ask you one very brief question on the matter of the ratio of rupee to the gold mohur, because it is not a matter which we will go into at any great length. You say in explanation of clause 18 that the rate of Rs. 15 to £1 would cause the least disturbance in the mercantile world. Let me put up to you a contention which has frequently been advanced before the Commission as against that arrangement, which is this, that to get to the rate of 15 to 1 in any form necessarily means an expansion of the currency, which necessarily means a rise in prices, which necessarily means a disturbance to the mercantile world in the form of existing contracts and rates of wages as based upon the standard of living. What would your view be, as to that contrary contention, that you cannot get 15 to 1 without an increase in the currency, which these critics would call "inflation," which would mean a rise in prices, which would mean a disturbance to existing contracts, to the standard of living, to wages and to general industrial and mercantile conditions?—Well, the simplest answer would be that you will take some time to work up to it. You won't do it all of a sudden, to-morrow morning; and if it is done carefully, if as you say what the critics call inflation is brought about gradually, the difference would not be perceived. If you take, I am only saying it as a mere illustration, say two or three years in effecting the change there would not be any dislocation such as it has been for example in bringing it up to 1s. 6d., the present ruling rate.

8804. Some well acquainted with the operations of the exchange market tell us that it would be impossible to make the process gradual, that the mere knowledge that the Government of India or the currency authority were working towards a 15 to 1 rate would be anticipated by the market, and that the rate would go there, if I may say so, the day after to-morrow, resulting in the disturbances to which I have referred. If that were so, then the gradual readjustment to which you refer would not be possible, would it?—But if I may point out, that overlooks the fact that this will only be an internal ratio, that as far as the exchange market is concerned, if the effective gold standard is established, it will have no concern with the internal ratio. It is simply a matter of the relation of the shilling to the sterling; which I take it it does not affect the sterling dollar ratio.

8805. The gold value of the rupee is now 13⅓ to the sovereign, is it not? You propose to make it 15 to the sovereign?—Yes.

8806. I do not see how that can have no effect upon the exchange rate?—For the simple reason that the rupee would not figure at all under the effective gold standard in the exchange rate. Does the shilling figure in the exchange rate at all?

8807. The exchange rate, we recognise, has not an immediate effect upon the vast majority of the people of the country; but what would the effect be upon all contracts expressed in rupees if you alter the gold value of the rupee?—That, as I say, ought to be gradual; and in that case in the previous answer I gave you to your suggestion about the plea of those familiar with the exchange market, I contend that the exchange market will be disassociated from the ratio of the rupee and the mohur the moment you establish an effective gold standard. As regards the effect on rupee contracts, it is a fact that if you can work it up there gradually it will not be felt.

8808. But internal prices, we agree, adjust themselves to the rate of exchange?—Well, if the internal prices follow as they should under the gold standard the world gold prices, there, too, it will be relatively immaterial.

8809. Now we come to the last paragraph under this clause. You say: "The danger of having too heavy a demand for silver coin to be changed into gold can be averted by making the rupee limited legal tender and thus restricting its use." It is commonly put to us that the result of making the rupee limited legal tender would be very much to increase the demand for silver coins to be changed into gold, because everyone who holds rupees will think their value is going to be affected, and since they can get gold for them they will desire to do so. Which is the right view as between those two?—There is this consideration to be borne in mind before deciding which would be the right way, and that is that a certain number of rupees must be in circulation; people cannot do without them, as the average Indian transaction is very small, relatively speaking, which no gold coin convenient for daily handling can settle, and the smaller rupee must be necessary for it. I take it that even if you limit the legal tender of the rupee the danger of the whole of the rupees in circulation to-day coming up for conversion may be ruled out absolutely.

8810. No doubt a large proportion of the existing circulation by common agreement can never be spared from circulation; we are only considering whatever margin can be spared?—As to that opinions may differ, but my personal opinion is that you need not expect more at the outset than 100 crores for conversion—at the very utmost.

8811. Just before we come on to that, could you make it any clearer how, in your opinion, the demand for conversion is averted by making the rupee limited legal tender?—I should improve that word and instead of "avert" I should say "reduce" or "modify."

8812. How does limiting the legal tender of the rupee tend to reduce the demand for conversion of rupees into gold?—In this way that up to the limited amount the rupee in any case is currency in circulation. I mean we are not demonetising in the sense of absolutely abolishing the rupee coin; therefore we are keeping a certain number of rupees as ordinary currency, and to that extent we are freeing the people from the temptation of converting the whole lot. That therefore modifies the demand.

8813. Then one might perhaps say that the intention of the sentence is that the danger of too heavy a demand for silver coins to be changed into gold will be reduced by the circumstance that a large number of rupees must still remain in circulation?—That is so.

8814. If that was all the sentence connotes I should feel no difficulty?—Yes, that is so.

8815. Under clause 20 is a passage to which I previously sought the reference, and could not find it. You say: "The successful working of all these suggestions depends on the constitution of proper banking facilities for the masses of the people." That is in reference to a previous question I asked you; I am only just quoting it for the sake of our records?—Yes.

8816. Passing on to part 2, Paper Currency, I find that your recommendation is that the currency note should become a note of the Imperial Bank of India. I want to ask you about notes of smaller denominations that Rs. 5. At the end of the first paragraph of explanations to section 48, you say: "But the same reasoning which has led us to adopt the 5 rupee limit as the lowest prevents us from going lower still to economise the use of silver of the rupee. The people can understand or feel the need for economising gold probably because their average transactions do not really need gold, but they will not accept the paper substitute of the rupee without all the suspicions of people accustomed to be swindled being aroused." We have had a good deal of evidence to the effect that when the 1 rupee note was in circulation it went very well; it was an acceptable and very popular form of currency. Do I understand that you are in disagreement with that?—I am.

8817. On what experience do you base that? Our evidence, if I may say so, comes from bankers and people in some close commercial touch with the people?—In the first place if you look up the figures, compare for example the total circulation of 5 rupee notes with 1 rupee notes, or 10 rupee notes with 1 rupee notes, the circulation of the 1 rupee notes never came up to anything like the circulation of the 5 rupee or 10 rupee notes. That is a matter of statistics: you can find that out for yourself.

8818. Do you mean in numbers or in value?—In value.

8819. Of course, they would have to go very well indeed to make up in value because they start with such a handicap. They were introduced about 1917. The figures, I find, are these: In 1917-18, that is the year they began, they started with only 33 lakhs. In 1918-19 they went up to 10 crores. In 1919-20 they went up to 13 crores. Would not that seem to suggest a very rapid growth in acceptibility?—It does certainly according to those figures; but you must also remember that those were abnormal times for currency requirements. Compare the figures of the rupee coinage during those years.

8820. Perhaps it would be more satisfactory to take the percentage to gross circulation as a measure of popularity. The percentage to gross circulation was this: In the year they began (1917-18) it was only ·4 per cent.; in the next year it was 7·8 per cent.; in the next year it was 8·7 per cent., still showing a steady growth, if you take the more scientific test of percentage to gross circulation?—How does it compare, if I may ask, with the circulation of 5 rupee notes?

8821. You mean the percentage?—Yes, please.

8822. The 5 rupee notes were, in the first year, 6·4 per cent.; in the second year 6·8 per cent., already less, you see, than the 1 rupee notes; and the third year 7·4 per cent., still less than the 1 rupee notes?—And the 10 rupee notes?

8823. The 10 rupee notes are, of course, the most popular. In the three years we are considering they were 31·9, 34·8, and 35·3 per cent. In view of those figures, does that suggest any possible modification of your views as to the unacceptibility of these notes?—I think I still remain convinced that it would be unwise to have 1 rupee notes or any notes lower than Rs. 5.

8824. The whole of the explanatory paragraph to clause 49 appears to me to proceed upon the presumption that the note issue in India did not make any great progress before the war. Is that borne out by statistics?—It went up to only 55 or 60 crores in practically 50 years.

8825. Quite generally, in view of the condition of the nation, in view of the undoubtedly backward state as regards education in fine currency matters of the great bulk of the Indian people, on the whole, does not the progress of the note issue before the war appear to be satisfactory?—I think it might have been more so. In comparison to the rupee coinage even, the note circulation did not keep anything like the pace that it might have.

8826. It was not at the pace that you desire to see?—Yes.

8827. In paragraph 53—(this is a minor point, but I just want to question whether your statement is quite watertight)—you say: "All officers of the Imperial Bank of India entrusted with special functions, and authorised to provide, sign, issue, or exchange the currency notes," and so on, "will be appointed by the Directors of the said Bank subject to the approval of the Governor General in Council." I am afraid a Bank that desired to do so might rather beat you on that paragraph, might it not?—How do you mean?

8828. Supposing it were to appoint some subordinate clerk to be entrusted with the special functions under the Act. Might it not get all the practical control which you so desire? It could do so *pro formâ*, could it not?—A subordinate clerk could not be authorised to sign or issue or cancel a note; he may only be delegated to do the work for the time being.

8829. If the Bank was bent on driving a coach and four through your Act it might appoint a chaprassi *pro formâ* to sign the notes?—I certainly did not take in that contingency.

8830. One has to take all possible contingencies into account in drafting an Act of Parliament. However, with this you deal more fully in your final section. In the third explanatory paragraph to 53 you recommend that there should be no distinction between an Issue department and a Banking department, and you base your recommendation on the fact that the maintenance of such a distinction would lead to difficulties in tho money market becoming more acute than ever in a period of crisis. The only analogy possible to suggest is that of the Bank of England, is it not?—Yes.

8831. Is the differentiation of the banking department from the note issue department found to place any hindrance in the way of mobilising the reserves under the present system for the purpose of avoiding the stringency of the money market?—Nothing very great, except in very acute stringency, when it does interpose some delay before such a measure as the Bank Act, Suspension Act can be passed for currency to be placed at the disposal of the Banking department.

8832. You will note that, under your own system, we have to deal with a similar provision for an emergency?—That is unavoidable.

8833. As regards the reserve, you recommend a reserve of which 50 per cent. is to be gold coin and bullion and 50 per cent. to be securities?—Yes.

8834. In paragraph 57 you say: "Nevertheless, the amount thus fixed may be increased under the authority of a resolution of the Legislative Assembly for any time or an order of the Governor General in Council for a period not exceeding 3 months." In general, do you see anything undesirable in introducing into the currency system of the country as a necessary part of its mechanism legislation by the legislature; is that not a cumbrous method?—In the ordinary functioning it would certainly be cumbrous; but in extraordinary emergencies such a procedure would be advisable.

8835. The passage of an Act of Parliament is often attended with a certain amount of controversy, of party strife and of delay. In the nature of the case the need for this currency might arise suddenly and in an emergency. Might there not, therefore, be something inappropriate and unpractical in making it depend upon the resolution of the Legislative Assembly?—In that particular case I should give it to the Governor General for three months.

8836. Supposing the three months had expired and there is still a necessity?—Such an emergency will have to be very extraordinary, and in that case I think we may take it, as happened in the Great War, that all parties would be agreed in that event and that there would be no party spirit manifesting itself in the Legislative Assembly if the emergency is so great as to last beyond three months.

8837. Your next important element of policy is in the explanatory paragraph to clause 61, in which I understand you say you "see no reason why the Imperial Bank of India should be kept out of the exchange business"; indeed, as I understand from a further part of your analysis, you contemplate that things should so work out that there should be a practical monopoly of exchange business in the hands of the Imperial Bank?—Yes.

8838. You recommend that the dividend of the Imperial Bank is to be limited to 10 per cent.?—If it is a private corporation: but personally I would prefer the bank to be nationalised wholly.

8839. That is not provided for in this?—Not in this: I have not gone into the detailed composition of the Bank in this.

8840. The Bank is to make a lump sum payment of fifteen lakhs a year in consideration of the exemption from stamp and other duties in respect of the note issue, and profits above ten per cent. are to be divided equally between the proprietors and the Government after 25 per cent. has been put to reserve?—Quite so.

8841. That is the general basis as regards the financial aspects of the bank's business?—Yes.

8842. You say you have not gone into the composition of the Bank. Nevertheless in Part III you have laid down, by way of additional provisions, the general principles subject to which the subsequent Bank Act is to be drawn up. The Bank is to allot fully paid shares to the State of not less than one-third of the total authorised capital of the Bank in exchange for the bullion and coin reserve now held by the Government. The Government is to nominate one-third of the Directors to the Bank on a recommendation from the Legislative Assembly from among the officers of the Finance Department of the Government or from the Members of the Legislative Assembly and the Council of State?—Yes.

8843. Do you think it desirable to introduce the direct action of the Legislative Assembly in appointing directors of the Bank? Do you not fear that this might introduce political and partisan considerations which would be undesirable?—I should be inclined to agree to that. I am aware of this point, and my reply to it would be that if the constitution of the Government of India is altered, and it is made fully responsible in the sense that the British Cabinet is to Parliament, then I should leave that power to the executive government of the day. In view, however, of the present constitution of the Government of India, at the risk of partisan feeling of which I am perfectly aware, I have introduced this clause regarding the Legislative Assembly. But I am fully aware of the undesirable feature.

8844. What purpose does this close association of the Legislative Assembly in such a detail as the appointment of directors serve?—Greater publicity and greater criticism, if and when necessary.

8845. Is publicity not adequately provided for by your provisions as to the publication of accounts?—I am afraid that is not enough.

8846. What further publicity would you hope to obtain by this method?—I should require more frequent general reports, besides the mere mass of figures in the weekly or fortnightly returns, and explanations too—something like, for instance, what we have got in the Standing Finance Committee Report which gives more detailed explanations for the general working of the finances.

8847. I understand that you do not yourself underrate the undesirable elements in making the appointment of directors to the bank possibly the subject of party strife, and, putting it at the worst, a scramble in the party cockpit?—I do not under-rate that.

8848. Further on you say the Finance Member on the Board of Directors is to have the right to postpone a decision of the directors by a minute of dissent, pending the orders of the Government of India or a resolution of the Legislative Assembly. Does not that have the effect of making the Legislative Assembly a court of appeal as to the conduct of the business of the bank, and is that not undesirable?—It arises again from the same general statement I made before.

8849. I will return to that in a moment. In explanation of clause 76 you say: "Under these provisions there would be instituted nearly five hundred branches and agencies, possibly many more, and will thus afford India a proper banking system." I understand, thus, that the improvement in the banking facilities and the banking organisation of India for which you look is to be really a great extension of the activities in all forms of banking business of the Imperial Bank?—That is so.

8850. Thus making the Imperial Bank in substance a monopolist in the banking business of the country?—I would not say entirely a monopolist; but if I may explain at this stage a little more fully, the kind of banking organisation that I envisage would be something of this nature. The Imperial Bank would be, as it were, at the top of the banking organisation for the whole country, doing banking business for Government, doing exchange business, doing the business of buying and selling bullion, and looking after the note issue, and being the banker of public and semi-public corporations. There will then be private banks no doubt. In all big cities also I envisage the creation of what I would call municipal banks, which will do the local banking of all kinds; they would, however, be affiliated or be in close working agreement with the Imperial Bank which would also have special departments for looking after industrial and agricultural finance, which would necessarily be of a different type from commercial finance; and the co-ordination of all these different banks, radiating as it were from the central activities of the Imperial Bank, might perhaps in one sense mean that the Imperial Bank would be a monopolist, but not in any other.

8851. You do not fear that such an organisation, with such privileges and such extended powers in the hands of the Imperial Bank, might put it in such a position that it would be impossible for any private Bank to compete with it?—I should not be sorry personally if private banks were not able to compete with the Imperial Bank.

8852. You are opposed to competition as a general principle in the commercial world?—I do believe in nationalisation and socialisation.

8853. Finally, to return to a question which I have already put to you, in paragraph 84 you recommend the creation of a committee of supervision with very wide powers for demanding the opening of new branches and of suspending, censuring, or advancing any officer of the Bank. As you put it, it is to be a committee to control the bank, and it is, in particular, to have the right to appoint examiners to inquire from the outside into all the business of the bank. This committee is to consist of seven members, of whom four are to be chosen by a resolution of the Legislative Assembly. There I have again to put the same question: do you not see something very dangerous in thus in substance placing the whole life of the Bank in the hands of politicians?—I would give the same answer as before.

8854. In particular, what do you think would be the effect upon the purity of political life if all the officers of the Bank could be suspended, censured or advanced by this political committee?—It would be in principle and also in practice very undesirable. If we had a Government carrying fully the confidence of the people, then I should leave it to the executive Government; I would not interpose the Legislative Assembly in these matters at all.

8855. May I ask you to be kind enough to deal with any supplementary questions which any of my colleagues may want to ask you?—Certainly.

8856. (*Professor Coyajee.*) Professor Shah, if you will allow me, I will put a few questions to you as regards the peculiarities of the position of India as regards the introduction and working of a gold currency and standard. In the first place the position of India is favourable as regards the introduction of gold currency on account of her usually favourable balance of trade?—That is so.

8857. But do you not think that India will have to pay larger prices for the demonetisation of silver than other countries did, in this sense, that the value of silver ornaments which are the past savings of the people will fall appreciably? — In what sense? Supposing we take the present ratio at 13⅓ and I suggest to make it for internal purposes 15, the difference would be 12½ per cent.

8858. Not that way, but because India will withdraw from the silver market and therefore the world price of silver will fall?—The world price of silver would fall, if you were to throw the entire hoard of silver that India has to-day upon the world market, which at the most would not be more than 500 crores, roughly speaking, and all of which, by the way, cannot be so thrown. We need not even anticipate that. The silver price would not be depreciated by more than 25 per cent., i.e., double the depression as regards the coin. That is the maximum that we need fear at the worst.

8859. What I was meaning was that India being one of the biggest buyers, as soon as the silver market people learn that we were withdrawing from the market, there will be at once a fall?—There will be; but if we do not go out ourselves and sell our own silver for the time being, then we need not accentuate that fall.

8860. Yes; but the individual holder or possessor of silver would not and could not possibly hold out for a prolonged period?—Let us distinguish between the coin portion and the ornament portion. So far as the coin portion is concerned it will depreciate; but so far as the ornament portion is concerned I believe that it will really not come for conversion.

8861. Not even in times of famine?—I was just coming to that; in ordinary times it would not come for conversion; it would in an extraordinary emergency like a famine. There you have to take into account the fact of the frequency of famines. The general opinion is that a severe famine occurs something like once in ten years, that is, a famine so severe that it would require you to part with such little reserves that you have in the shape of ornaments. As a matter of fact as regards this danger that you mention, we may spread it over, if one may say so, a number of years. So that argument at any rate does not frighten me much.

8862. In the second place, a very large proportion of transactions in India must be carried out through the instrumentality of the rupee. For a long time you cannot reduce the rupee to the condition of the shilling?—I would agree if you said you cannot abolish the rupee altogether.

8863. But could it be reduced to the status of the shilling?—That I think it could be. Just as shillings are required for paying small wages, so rupees would

be required and that status they would maintain; but they would not have the status which they have to-day of a standard coin, even though in reality they are supposed to bo a mere token.

8864. Now, look at the English farmer. He does not reckon his earnings in terms of shillings, but the Indian farmer will have to do so in terms of the rupee for a very long time?—He may have to. Yes.

8865. Then there is a third contrast. Does not the fact that India has habitually a favourable balance of trade, present an inherent difficulty in the way of the working of any monetary standard whether it is a gold exchange standard or a gold standard? In the case of the gold exchange standard, there is the fact that because of successive favourable balances, more rupees were coined and consequently there was the trouble of over-coinage of rupees. To a certain extent the same difficulty will come to the gold standard also in the country because suppose you take these four favourable monsoons which we had. The first three would draw in so much gold that prices might rise. And although the fourth monsoon was favourable yet because the prices in the country are high, the balance of trade might have to become unfavourable?—This last I think is rather far-fetched, but I will answer the whole argument. Your apprehension might be true if you were allowing for a favourable balance of trade in the shape of gold to this country to be deposited in the form of currency in general circulation. The President drew my attention to this point. But this ought not to be allowed if you want our banking system to get into proper order. All the gold must be reserved and conserved in our central mobilised banking reserve, which will be effectively available when we want it in the case of an adverse balance, and which should not affect and should not be allowed to affect the total volume of circulation to any appreciable degree.

8866. But how? When there is a favourable balance, the gold comes into private hands first. Then they take it to the Central Bank and deposit it there. And they can always draw notes against that. Therefore, the potential inflation continues?—I have therefore fixed a maximum value to the total note circulation. I say 100 million mohurs, or 300 crores of rupees at most. I have taken that precaution to see that the maximum is already fixed to the total amount of notes. Even if you add in 200 crores of new notes in the course of the next five years you cannot (much inflate the total circulation) because the maximum is fixed. By putting gold in the bank reserve I have not suggested an indefinite expansion of the note issue. Gold then would be for all practical purposes inoperative as far as the level of prices is concerned.

8867. If you will allow me, why can't I draw cheques against it?—Then we come to the deposit currency and the inflation by means of the deposit currency against that. Now, that of course necessarily depends on the requirements of the trade. If trade wants a greater volume of currency, obviously there is a greater demand for it; and by refusing it at a time when trade wants greater currency you are needlessly preventing trade activity by stringent currency regulation. At that time certainly the deposit currency will grow purely in response to trade requirements; and the moment the trade requirements stop, that must end too.

8868. Because there was a couple of years of good harvests and favourable balances, therefore prices in the country have already risen; and under a condition of high prices trade does want artificially more money and therefore the deposits will be drawn upon? —I think perhaps I am not able to make my point clear. If the deposits are drawn upon in a sense without a backing that is one thing. But if the deposits are drawn upon because the currency is just responding to the call of trade, then the danger of the high prices in the final part of your argument, namely to the extent of turning what balance there is against us, need not be apprehended. That is all I am saying.

8869. (*Sir Purshotamdas Thakurdas.*) You, Professor Shah, recommend a gold standard with gold currency. You don't think a gold standard by itself without gold currency is feasible or desirable?—It is feasible. I don't think it is desirable.

8870. Why is it not desirable?—Well, for one thing to my mind it seems meaningless to call a thing a gold standard and not to have gold currency. Unless you mean the gold exchange standard.

8871. No, gold standard?—If you mean gold standard and no gold currency in the sense that there is no gold coin corresponding to the standard, then it seems to me to be meaningless. What exactly do we mean by gold standard which is without gold currency? I am frankly unable to conceive it.

8872. Well, we are told that gold standard without gold currency is in vogue in England at present?—Well, there is gold coinage surely?

8873. But it is not available?—Not available in the circulation. But gold is in the bank vaults. That is something quite different from saying that there will be no gold coins at all.

8874. But supposing we have it in the same way as they have it in England, gold in the vaults at Calcutta and Bombay?—That is practically what my proposals amount to, that I would like the gold to be in the banks.

8875. But you also say that there should be gold currency?—To that extent, I made an amendment in answer to the President too. Every time he pointed out the word "circulation" I amended that.

8876. (*Chairman.*) As to that I would like it to be quite clear that the Professor does suggest convertibility, for instance of his notes?—Oh yes.

8877. (*Sir Purshotamdas Thakurdas.*) Therefore, gold notes should be convertible into gold?—Yes.

8878. Therefore, there will be gold coin in circulation?—That may be.

8879. Which means that Government are bound to give gold coins on demand, which is not the case in England at present, I am told?—Not at present. But I should like to be enlightened on that point also. I am not quite clear whether by law a person demanding gold coin in England can be legally prevented from getting it. By persuasion I can understand; by the bank authorities showing it to him to be undesirable. But I am not quite clear whether by law if a man insists upon it he can be refused.

8880. (*Chairman.*) He has no right to gold coin against notes?—He has no right by law?

8881. (*Chairman.*) That is so.

8882. (*Sir Purshotamdas Thakurdas.*) So I am told is the case in Holland too. They have very substantial backing of gold against gold notes but they can't get gold coin for internal purposes. Would you recommend that for India?—I would not recommend it immediately. I should like people to be educated in banking methods.

8883. You would recommend to keep that as the ideal to work up to?—Yes.

8884. Now you admit that gold standard without gold currency is the most economical?—In the sense I am meaning it, certainly.

8885. Well, will you take it in the sense in which I am putting it to you, namely that it will mean less cost to the State?—You mean gold in the bank vaults and not in circulation?

8886. Yes. It would be most economical?—Yes.

8887. In spite of India needing all the economy possible in the expenditure of the State, why do you recommend gold currency in circulation then?—But I am not recommending it in circulation actually. I am suggesting that the gold should be in the banks in India.

8888. But I understood that you would like that to be kept as an ideal to be worked up to; which means that immediately the gold standard is adopted you would like gold coin in circulation?—It will be kept in the circulation whether I like it or not.

8889. Therefore you say that it would have to be put into circulation?—My ideal would remain the same, as I have been saying, but the consequence of the immediate putting into operation of the gold standard may be that some gold will get into circulation.

8890. But it need not get there; unless you suggest that the Commission should recommend it. Would you recommend that the Commission should suggest that gold coin should be put into circulation?—I should certainly not recommend that the Commission should request that *ab initio* and for ever gold should never be allowed to get into circulation.

8891. Therefore, gold should be allowed to get into circulation later on and that is more expensive to the State?—More expensive to the State, I didn't say. It would be more economical to have a gold reserve but I don't think this would be more expensive to the State.

8892. But a gold standard without a gold currency is the most economical?—Most economical in the general interests of India as such.

8893. Most economical in the interests of the tax-payer?—Oh, I am not prepared to say that. I did'nt say that either.

8894. You don't think that a gold currency is costly to the country?—Costly to the country in the sense that we should be needlessly having a more expensive and uncivilised form of currency.

8895. Exactly. In that sense I say it would cost more to the country to put gold currency into circulation?—That is quite a different thing from saying it will be more costly to the tax-payer. If I may explain myself. When I say that it would be more economical to the country I mean it in this precise way. Let me make myself quite clear. That if you have, not gold in actual circulation, but, as I said, in the banks, who are on the strength of this gold in their reserve able to so expand their credit facilities as to be able to assist the trade and industry as much as they require, then they help the economy of the country very substantially. *Per contra*, if they have not got that reserve which is dissipated and impossible to be attracted to the banks, they are necessarily prevented from granting those facilities to trade and industry, which therefore constricts trade and industry and hurts the economy of the nation. That is quite a different thing from saying that it is costly to the tax-payer. I mean it in that sense, when I say that a gold standard is the most economical.

8896. I see the point of view from which you state it. Now let me put it from the point of view from which I mean it. Gold currency in circulation would mean more cost to the tax-payer in the sense that more gold would have to be put into the treasury for the purpose of being handed out in exchange for rupees or rupee currency notes on demand?—But I should like to be quite clear as to how you mean it would be more expensive to the tax-payer.

8897. I will illustrate it. You said in reply to the Chairman that 100 crores of rupees may come into the treasury to be exchanged for gold coin?—At the outset, yes.

8898. The equivalent in gold of 100 crores of rupees will have to be put into the treasury before you declare the gold standard and gold currency in force. It would cost you something to get the 100 crores of rupees worth of gold from outside?—You must be prepared for that contingency.

8899. Yes, but if you put that in operation you will have to get the gold and put it in the treasury. You would either have to lock up your reserves or seek credit outside to get 100 crores of rupees worth of gold. You would have to pay interest on it. Would that not mean expense to the tax-payer?—As regards these 100 crores and for a very brief period.

8900. May I request you not to discuss the 100 crores figure because I propose to discuss it with you later. Would you concentrate yourself on the point of view which I have just suggested? It means that you must provide gold resources in order to facilitate the possible conversion demands that may be thrown upon it?—Yes. My simple reply would be that already we have got resources, gold resources and silver resources, which if not over-abundant or too ample, are quite sufficient to give us some assurance that our gold standard and currency will not on the very first day prove futile.

8901. What you mean is that in the two reserves that you have got, you have got gold and gold securities which can be liquidated and you can provide the 100 crores of rupees worth of gold and gold securities? And to that extent it would be more expensive?—To that extent you can make a sacrifice.

8902. To that extent we will lose that revenue? A gold currency in circulation does mean more expense than a gold standard without a gold currency?—But any system of currency which has a fiduciary reserve and is converted into rupees from a fiduciary reserve will to that extent cause a loss of revenue.

8902A. Do you regard the income by way of interest from the securities as a normal income of the State? It is so regarded at present in India?—I do not think that is advisable, it is wrongly so regarded.

8903. But to that extent it will make a hole in the revenue? I am only asking you because to-day the Finance Department does take the interest on the gold standard reserve and the paper currency reserve securities to the credit of the revenue budget. To the extent of those securities being reduced in order to get this gold, there would be a smaller income and to that extent it would cost the tax-payer more?—To that extent; but I still repeat that it is so wrongly regarded as income.

8904. I may accept your statement, but whether right or wrong it would make that much diminuation in your revenue budget?—So far as my opinion is concerned, the reply is quite clear that if the thing is wrongly so regarded, it is wrong and ought not to be bothered about.

8905. Irrespective of whether it is right or wrong, I say for the next year if the Finance Member has to frame his budget on the scheme you have put, he would have to take credit for that much smaller amount of interest on the paper currency?—Yes.

8906. And to that extent it would mean more cost to the tax-payer?—I agree in that form.

8907. Now we will therefore ask only one more question,—you think therefore that the tax-payer must be prepared to make that sacrifice in order to get a gold standard with a gold currency?—Certainly, and if I may illustrate that with an anology: Just for instance as we sacrificed 7 crores of rupees roughly speaking per annum from the opium revenue, which was wrong, we are agreed, I should on the same anology treat this reduction in the interest income, if it is derived from a wrong policy.

8908. If it should mean a little extra taxation, you think that the question of having a gold standard and a gold currency circulation is so important that that extra taxation if any might be tolerated?—It is worth paying it, though I do not think it would be either heavy or protracted.

8909. Now regarding the 100 crores of rupees which you think would be tendered to the currency offices for conversion into gold coin when the gold coin is payable by the Government, may I ask you whether you have arrived at that figure on some calculation or whether it is a rough haphazard figure?—It is not haphazard. At the same time I cannot say that it is a very scientific calculation. I may give you the main outlines of my general basis for this rough calculation for what it is worth. I take it that the active circulation of rupees to-day is about 300 crores, of which, testing by means of agricultural produce value and so on, and also the population statistics I should think about 250 crores would be required for ordinary transactions?—250 crores of coined rupees would be required certainly by the people for active circulation. I am taking the gross circulation. The maximum according to my calculation would be about 300 crores of which

250 crores I personally think would be required. I think the net demand for conversion, should it come, would be 50 crores of rupees; and I also take it that at the most we must be prepared for a reduction in the note circulation by way of conversion and replacement by gold in the popular hands of another 50 crores. The note circulation is 190 crores, in the neighbourhood of 200 crores. We would convert it into gold, we would make it expressed in gold, on the assumption that gold would be more acceptable to the people than notes. If we make that assumption for the sake of argument—in the long run I believe that the eventual, the inherent superiority of the note will asset itself. Out of 200 crores about 50 crores may have to be the maximum required to be converted into gold.

8910. So that I may summarize what you say by saying that you expect 50 crores of silver rupees being tendered and you expect that 50 crores rupees worth of silver currency notes will be offered in exchange for the gold coin?—At most.

8911. Take rupees first: you said that you think that 250 crores of silver rupees are in active circulation to-day, and you do not assume that that amount would be substantially reduced even with a gold currency?—I said from 300 crores, 50 crores would be offered, therefore 250 crores would be required; that is in circulation and that would be required.

8912. That works out to something like Rs. 8 per head of population?—Yes, about 10, if you speak of British India.

8913. Banking facilities in India are comparatively speaking very few; the transport facilities are similarly much smaller than in Europe; the facilities for getting your paper notes exchanged into rupees are also comparatively small. If in England to-day the average of the shillings outstanding per head of population is 21, you think that Rs. 8 to 10 per head here with the handicaps I have just mentioned is a safe calculation?—I believe so, in consideration of the relative wealth of the two peoples.

8914. You think that where they require in England 21 shillings per head, in India Rs. 10 per head would be quite a safe calculation?—Quite. I should even go down to 5, bearing in mind the relative position of the wealth of the two countries, 5 would be safe, but in view of the difficulties, I should leave a margin and put it at 8 or 10.

8915. 21 shillings as you see are double the smallest denomination of notes: there are notes for 10 shillings and still in spite of that, the number of shillings per head outstanding is double that. The smallest denomination here is only Rs. 5. You still think that is not an underestimate of what is in active circulation, the rupees?—I do not think so.

8916. You think there are hoards of coined rupees?—Not large.

8917. Where are these rupees to-day, the 300 crores?—300 crores are in active circulation but 50 crores are with people who can afford to lock up Rs. 15 instead of one gold coin.—I won't say " lock up." If you mean they are taking it back for purposes of hoards, I won't agree. We are now thinking of the active circulation being reduced to the extent of 50 crores in view of the superiority of gold.

8918. Professor Shah, if the 300 crores of rupees are all in active circulation, then the man who would exchange fifteen rupees for one coin either with the motive of curiosity or with the motive of keeping that coin in his bag or in his safe, I think, would eventually put that into circulation, active circulation. This is not replacement of the hoard. Where are the 300 crores of rupees outstanding?—They are not in active circulation, and you say you do not expect there are any rupee hoards?—The coined rupee may not be much in hoards but the silver in the shape of ornaments and so on may be.

8919. But we are not talking of silver bullion?—As far as the coined rupee is concerned, I estimate that the active circulation now in the hands of the people is 300 crores.

8920. And if 50 crores of rupees come back to be exchanged, they would only come back to be exchanged for gold for a temporary period, the people being attracted by the mere curiosity of the new gold coin?—The people's belief is that it is a superior coin.

8921. Any way you think 50 crores rupees worth of gold will have to be counted upon as being required?—As a maximum provision.

8922. Why do you think they would exchange 50 crores of notes for gold coin?—For the same reason that the general belief is that it may be a superior or a better medium of exchange.

8923. What denomination of notes would then be tendered? 5,10,100?—Small notes I think, comparatively speaking.

8924. You mean 3 five rupee notes for one coin?—5 and 10 rupee notes.

8925. That will be done for curiosity or for any other purpose?—I think the general feeling at first would be, taking the average intelligence of our people, they would think gold to be better than the note, better to keep in the pocket and of more value as they would feel.

8926. Would they keep silver coin in their pockets more than notes?—That they do even now; there are more silver coins than notes in circulation.

8927 and 8928. But the class which handles silver coin is different from the class which handles currency notes?—In the case of small notes I do not think there is much to choose. The larger notes are different. In the case of the small notes, I think it is practically the same class. I mean we are talking of the 10's and 5's which practically means 40 per cent.

8929. You really expect that with a gold coin in circulation even the paper currency may be effected?—People will take less paper currency for a temporary period—we must at least provide for that.

8930. How long will that last, a few years or a few months?—Not a few months, a few years, but I am not prepared to say how long.

8931. It will all adjust itself after 10 years?—Not so long as 10 years. It is only a personal opinion, but I do not think it would be more than 3 years. If we go about it rightly and adjust all the measures simultaneously—you must not take one proposal in water-tight compartments and leave out others—if you take all this comprehensively and go about at the same time, simultaneously, then I think three years would be a safe period to think of for the adjustment.

8932 At the end of three years all the coin would return and people would handle paper as freely as at present?—I think so.

8933. And would the paper notes be more popular when people see gold currency-coins available?—Paper notes would be more popular; they would be more convenient. And I would also add that the further banking facilities that I have suggested in the course of this evidence would make those facilities even more convenient than the notes themselves.

8934. What I mean is, leaving those facilities as taking a longer time to develop, the banking facilities, taking the conditions as they are, do you think that at the end of two or three years, by people seeing gold at the treasury, more confidence will be inspired in gold notes and silver than at present?—In the first place those facilities need not take three years to come into effect.

8935. Suppose we take it for the sake of our argument that those facilities are delayed, taking the things as they are now, do you think that the currency paper will get a set-back as far as popularity is concerned, or will really become more popular?—Temporarily, it may create a set-back.

8936. But after a couple of years or so?—The things will readjust themselves more or less to the same level as they are to-day and the note will circulate to the same level as it does to-day.

8937. Now regarding what you have said in Part III of your draft Bill, you have therein, in clause 2 of section 72 given us the constitution of the Board of the Imperial Bank. Now I see from your book, Indian Currency, Exchange and Banking, published in 1922, at page 401, that you have there given us a scheme of the constitution of the Board of the Imperial Bank The total comes to 25?—The directorate.

8938. Yes. But here if I understand you correctly, it is about one-third, or there is no number? You don't mention the number in clause 2 of your draft bill?—No, I do not.

8939. May I take it then that it is one-third of the 25 which is given in your book of 1922?—Yes; you may make it 24 to have an even number.

8940. Now there in your book the Government directors provided for by you are under (*f*) only two, out of 25. Here in your draft bill you have made it one-third of the total. As this is a later publication than that, may I ask you the reason for the change?—Because I feel much greater need of Government supervision and control in view of the greater and greater experience one gets.*

8941. I see; in 1922 you thought that a Government directorate of 2 out of 25 was sufficient; but now in 1925 you feel that it should be 8 out of 24 or 25?—And I add "if a private corporation," which I have mentioned here. So that my personal opinion still remains that the Bank should be a wholly nationalised corporation in which all will be Government nominees and no private capital either.

8942. In which case the shareholders will be paid out?—Yes.

8943. And that is your ideal? You still develop this Imperial Bank Act as you think that the ideal is rather remote to achieve?—You mean the present improvement?

8944. Yes.—Let me make that clear. There has always been an inconsistency in my position, if I may say so in this connection.

8945. Oh; I see; I did not know that—No; it is not a matter of regret to me. It is a position in which most of us are placed. It is simply an outcome of the fact that I have no confidence in the present constitution of the Government of India, that makes me hesitate in giving the complete nationalisation which I would otherwise give if the Government of India was thoroughly responsible and sympathetic to the people of India. I would then not stop at all at half measures. But I know this position which is illogical makes me stop at half-hearted measures that obviously make me inconsistent.

8946. I am very glad that you propose to discuss things as you see them now without as you say visualising them as your ideal?—Yes.

8947. And to that end you suggest this in clause 73 and the following?—Yes.

8948. Therefore, you suggest, to begin with, that one-third of the directors of the bank shall be nominated on a recommendation of the Legislative Assembly, either from among the officers of the Finance Department of the Government of India or from among the members of either House of Legislature?—Yes.

8949. You, therefore, suggest that the Assembly should be asked to elect these eight members of the Board of the Imperial Bank? That is what it comes to?—Yes.

8950. They are to select these officers or they may select non-officials?—As I explained to the Chairman, that is simply the outcome of the fact that the Government of India nominations do not carry fully the confidence of the Indian nation

8951. But we agree, Professor, now to overlook the ideal part of it in which perhaps many may not differ, and to take things as they are to-day; and let me put one question to clear that. You are, if I may say so, impatient about the currency reform of the Government of India, impatient in the sense that you do not want to wait until we get the constitution altered?—Yes

8952. Therefore, we must take cognisance of the conditions as they exist to-day, and we cannot wait for the ideal day for the constitutional reform to come. Recognising these things, and taking the Government as it is and the Legislative Assembly as it is, whatever powers they may or may not have, you still suggest that the Assembly should be asked to select eight directors from out of the members of the Government or from out of the non-official members, to serve on the Imperial Bank?—On a recommendation from the Assembly, yes.

8953. You don't give that right to the Governor-General in Council, but you give it to the Assembly?—Yes.

8954. If the Assembly selected two members from each party, do you think that it would be to the interest either of the country or of the institution?—If the Assembly's recommendations go on wrong lines, it does not require me to say that it will be undesirable and highly unfortunate.

8955. You said in reply to the Chairman that you were aware that political influences mostly count in such matters in any legislature.—I did not say "alone." But I say they would count.

8956. Do you think that the Assembly, as you have seen it working, is likely to be an exception to the general rule?—Of political influences being at work, their being subordinate or being at work?

8957. Being an exception to the general rule of the political influences being the guiding factor in such elections?—Let me understand clearly. You mean to say that in my experience do I think that the Assembly would subordinate political considerations?

8958. Would you not apply the same rule as you said happens to be the case in other legislatures in the world?—There is a natural apprehension in any case.

8959. Bearing in mind that apprehension, Professor, supposing something was to be done in the year 1927 or 1928, would you seriously suggest that the Assembly should be given the right of electing eight members to the directorate of the Imperial Bank or some other State Bank as you devise it?—I would seriously suggest on two grounds; one, of course, that the political constitution of the Government is not changed, and the second is that I would, in view of this danger of which I am not unaware, confine the recommendation, restrict the right of recommendation or election by the Assembly to predetermined classes, that they can select only from these groups, and the Assembly cannot go outside these groups to make its selection. You may say from among the officers of the Finance Department, from among such and such a class.

8960. Which class would you name there, Professor?—Of course, the Finance Department will be there; the officers of the Finance Department would, in my opinion, naturally be there.

8961. Naturally; but the officers of the Finance Department who are in the Assembly are only two.—They need not be members of the Assembly; they may be outsiders even. I have said so already.

8962. That is the non-official members?—No, they may be outsiders. They may be officers of the Finance Department, or non-officials or members of the Legislative Assembly.

* A communication has subsequently been received from Prof. Shah, stating that the passage in question relates to the Industrial Department of the Imperial Bank, and not to the Imperial Bank proper, and that the Board of Management of the Imperial Bank proper is described on p. 244 of his book "Indian Currency, Exchange and Banking."

8963. Three classes, one officers of the Finance Department. Then?—Non-official business community, let us say, the general business community, the eminence of whose members will be known to the Assembly; and members of the Assembly itself in which a convention might come to be established that such members as have banking and commercial experience might be selected.

8964. May I follow it up a little further? You would have members of the Assembly voting and selecting eight members from those who belong to the Finance Department of the Government of India, those who belong to the banking and commercial community, all over India and the other?—The members of the Legislative Assembly who have banking or commercial experience.

8965. I see, members of the Legislative Assembly?—Yes, such members of the Legislative Assembly who have banking or commercial experience.

8966. I see; they must select people of one of the three qualifications?—Or perhaps one other class might be added to that.

8967. At any rate, you would not restrict it to members of the two Legislatures?—No.

8968. Nor would you leave it open to the election of any member, either a lawyer or a doctor or a zamindar for example?—No.

8969. You do consider that qualifications are necessary?—Qualifications must be laid down.

8970. Even for election by the Assembly members?—Yes.

8971. And you think that those qualifications should be, he must be either an officer of the Finance Department of the Government of India or must be conversant in banking and commercial interests of the country?—Yes.

8972. It would be rather difficult, would it not, to very accurately lay down the qualifications and to say who should be looked upon as a merchant and so on?—It may be difficult; but it will be worth overcoming in this way. As you know, in all processes of election, there is nomination first. You nominate a person. The nominating authority will be aware of the qualifications. There is, for example, a convention or a rule even in the present Legislative Assembly that no proposals for additional taxation might be moved except by a Government member. Some such rule may be made in the case of these nominations, that these nominations also ought to come from the Government.

8973. Ought to come from the Government to the Assembly?—Nominations to be voted on.

8974. Therefore, all nominations should be subjected to Government who would select a panel of say 50 or 25 members out of those and the Assembly would select eight out of that number?—Yes; I was even thinking of a definite nomination of A, B, C, D and so on made by the Government and the Assembly being simply asked to vote upon them.

8975. That is what I said.—Of course you suggested an improvement which I am perfectly open to accept. A general panel of 25 from amongst whom the required number might be voted on by the Assembly.

8976. The same thing as it is in some cases in the Assembly. But the process is reversed. At present for election to certain committees, the Assembly elects, say 15 members, that is called a panel, out of which the Government nominates five. Would that meet your purpose equally well?—As you said it will be the reverse thing.

8977. Would that serve?—It would serve.

8978. The Assembly to elect say 15 or 20 after which the Government alone should nominate eight to the Bank?—Yes, it would serve very well.

8979. Now regarding (1) you suggest that that one-third of the capital of the Bank should be allotted to the State not in exchange for hard cash, if I understand it correctly, but in exchange for the bullion and coin held in reserve now by the Government of India against the notes now in circulation?—Yes.

8980. What sort of capital would you keep for the Imperial Bank under this scheme, 25 or 30 crores?—You mean the total volume?

8981. I am talking of the general capital.—There again I should like to make a fuller answer if I may.

8982. Yes, please do.—I take it the total volume to-day is 11 crores 25 lakhs or something like that, is it not?

8983. Well, we will proceed on that basis.—And it has got no responsibility with regard to the note issue. It is only a State Bank in the sense of holding the State's deposits and other public deposits. It is not a State Bank in the sense of a note issuing bank. Therefore the greater liability which rests upon an issuing bank does not fall upon the Imperial Bank to-day. In view of the proposed increase of responsibility, of liability, for these demand notes, which would then become the notes of the Imperial Bank, the capital must be large and I am inclined to double it from 11 to 22 crores; 22 crores would be by no means an extravagant expectation.

8984. Then 22 crores or 20 crores would be the capital of the Imperial Bank?—It might be more but at least 20 crores.

8985. You can take any figure but let us put it at 20. Now of this 14 crores should be paid by the shareholders and seven crores to be allotted as full paid-up to the Government in exchange for their reserve; and the profits would then be distributed as if the capital, I mean all the capital, was put in by a set of shareholders?—Yes.

8986. Then you further suggest deductions, don't you?—I suggest deductions in the sense that I limit the total amount of profits divisible in dividends, 10 per cent., and the rest after a provision of 25 per cent., for reserve, should be shared equally between the proprietors of the Bank and the State.

8987. Do you think the Government ought to guarantee a certain dividend also?—I think there is no need.

8988. You make them take the money backward and forward free of charge in a later section and if so would you not guarantee the minimum dividend?—In view of the great privileges given it is absolutely unnecessary to guarantee a minimum dividend.

8989. Do you think 10 per cent. easily attainable without any question?—Oh, very easily.

8990. I see. Now later on in section 3, Professor Shah?—Clause (3) of section 72, you mean?

8991. Section 72, clauses (1), (2) and (3), you say, "In such matters the president of the board or the committee shall have a casting vote in addition to the ordinary vote as a member; and shall have the right to postpone the decision by a minute of dissent pending the orders of the Government of India or a resolution of the Legislative Assembly on the point involved." Why should he go to the Assembly at all? If he has the option pending the orders of the Government of India he will never go to the Assembly.—Very well.

8992. I mean bearing in mind the confidence you have in the Government of India, judging from the remarks with which you prefaced your evidence, why did you put "or" there and not "and"?—I certainly would not make it "and."

8993. Then you think in certain circumstances the Governor General in Council has to be given the right of a substantial voice in the management of the Imperial Bank?—Rules will be made under this Act as under all Acts for the detailed carrying out of provisions such as these. Now a bye-law or rule may be made to say that in such matters as the undermentioned, whatever they may be, the president shall await the final orders, if he dissents from the general board of directors, of the Government of India or the Governor General in Council as the phrase goes. In certain other matters, you would

lay it down in the bye-law I am thinking of, that the final orders may come from the Assembly.

8994. Yes, I was looking for some explanation of that in your explanatory note to clause 72. I did not find any there and I felt it difficult to understand your use of the word "or" there. Now that you have explained it I take it this will be a subject to be dealt with by the rules made under this Act. Now who will have the power of framing these rules?—The Governor General in Council, but always subject to this proviso that I would like those rules to be placed on the table of the Assembly to be approved generally, not statutorily passed in the way in which you would pass an ordinary statute but generally approved.

8995. You would leave the rules to be framed by the Governor General in Council but subject to the approval of the Assembly?—Yes.

8996. So that the Government would not be able to change the rules even if occasion may arise?—Oh, no.

8997. But the rules will deal with minute details of the Bank and if you prevent the Governor General in Council from altering the rules as experience warrants, don't you think you are rather creating . . . . . —A complicated machinery?

8998. Well, not only complicated; I was thinking more of a hard and fast machinery which may not satisfy the management of an institution like a big bank you have in view?—You see I take it that the contingency here contemplated and in which that rule will function, will be a contingency which is likely very rarely to happen. I think in the ordinary working of the Bank difficulties will not arise. In extraordinary situations and very special emergencies the difficulty may arise, and there of course, in view of the extraordinariness of the situation, we must be prepared to face the difficulty. That is all that I can say.

8999. All that I was wondering at was whether you are not facing too lively a risk. You say we must be prepared to face it. You can only face it up to a certain point. With a bank like that you cannot face anything?—Therefore I am not suggesting anything in the case of ordinary matters. I take it there will be hardly any difference of opinion in regard to those. In the actual day to day working of the bank there will be hardly any difficulty. But take a case like this. For instance, the proportions of loans made say to Indians and to non-Indians. I have frequently heard it said; that is a sore point in many circles, I have no proof of it, and I am only giving it to you as an illustration to the point we are discussing; there is a feeling abroad that the Imperial Bank is somewhat stepmotherly as regards Indian demands and a little more liberal with regard to European or English demands. I give it for what it is worth. I have only heard it said. Now it is possible in a case like that, though it is a mere matter of detail, a big demand comes up to the Board of which the Finance Member is president *ex officio*, a contingency which actually did occur two or three years ago when the piecegoods importers of Bombay repudiated their contracts practically speaking for the reason that they had counted on the two-shilling rate when they sent the indents and the rupee went down to 1*s.* 3*d.* when the goods were received. They were not prepared to take the goods which were actually received in Bombay and Calcutta. They go back on their contracts and the firm of managing agents—Europeans—come to the Imperial Bank for accommodation; I am merely putting a hypothetical case. Now that accommodation or a similar accommodation, let us say, has been refused to an Indian firm of the same standing as a European firm which has got it. The authorities of the Bank are prepared to grant it to the European-managed firm; and the Finance Member, for the sake of my illustration I assume, is unwilling to concur with the general directorate of the Bank wanting to give this accommodation. He wants therefore to hold the matter up, though it is a matter of detail, for instructions from the Governor General in Council. Such a case may occur; but it will occur only on a very big sum being involved, in the matter of some general question being involved.

9000. Or it may occur very often if there is any credence to be put in the sort of rumours which you just now elaborated before us. It will happen very often if things are so bad as rumour has it.—If that feeling is so widespread it may happen.

9001. Now to deal with cases of this nature do you think that the sort of board you have enumerated on page 401 of your book* would at all be either competent——?—May I have it read out to me, please?

9002. Yes. Section 19 runs: "The supreme control, direction and management of this Bank shall be vested in a Board of 25 directors made up as follows:—

(*a*) Eight to be elected, annually, one each by the shareholders of the Bank resident in each of the principal provinces of British India, provided that no province with a total holding of shares which does not exceed one-twentieth of the total share-capital of the Bank shall have a right to elect such a director;

(*b*) Eight to be elected in the annual general meeting of all the shareholders of the Bank acting together;

(*c*) Two to be elected annually by all the shareholders in all the Native States where the Bank has opened branches;

(*d*) Two to be elected by the Debenture holders of the Bank if any;

(*e*) Three to be nominated by the Board of Directors of the Imperial Bank of India, one of whom shall be a managing governor of the Imperial Bank, one from among the other directors of that Bank and one representing the Land Department of that institution;

(*f*) The remaining two shall be appointed by the Government of India from among the senior most officers of its Finance Department."

That is the constitution. This means that the directors will be spread all over India from Burma to the southernmost point and the westernmost point and the northernmost point. Do you think a directorate elected on such lines can deal with the day to day work of the Bank where credits have to be voted every day and perhaps withdrawn every third day?—Not the whole of these 25 directors will meet every day; I do not suggest that.

9003. I do not say you do but that as your board of directors——?—That is the board in control of the general policy. There may be a smaller council formed. I believe I have suggested, speaking from memory, a smaller working council to dispose of the business.

9004. That is your constitution of the Central Board as it is of the Imperial Bank at present, meeting once every two or three months or something like that. Then you would have a local board as at present?—At each branch.

9005. Therefore the contingency that you named just now of the Finance Member of the Government of India having to veto a certain credit would not arise from day to day?—No, it won't arise; I never said it would arise from day to day.

9006. That is just my point and therefore the question of vetoing would only come up once every three months at the most?—At the most.

9007. It cannot deal with the personnel; it will only deal with the general line of policy?—Yes, it can only deal with the policy of the Bank.

9008. And therefore it is a thing which is not difficult for the Governor General in Council to dispose of?—I do not say it is difficult for the Governor General in Council to dispose of. It is only when a question of the type I gave you as an illustration does arise that a special procedure must be adopted.

* See footnote on page 444.

9009. I was trying to point out to you that a question of the type you gave me as an illustration cannot be dealt with by your board, it must be dealt with by one of the local boards. It cannot therefore be dealt with by the Finance Member of the Government of India because that is a day to day affair?—But in a day to day affair over a certain limit the Bank may require the consent and concurrence of the whole Board.

9010. Now for that purpose the Central Board would have to nominate a working committee as they have at present. These 25 people cannot be expected to deal with any live issue?—But the working committe would have the Finance Member on it.

9011. You would have a working committee therefore where day to day transactions are to be considered?—I should like to make a distinction, when you say day to day transactions. The every day routine matters I exclude. I only wish to say that though it may be a day to day transaction in the sense that all these transactions arise every day, still in a case like the one I illustrated before owing to the magnitude of the sum involved or the nature of the transaction, it may become desirable for the Bank management, for their own good name and security, to have the authority and authorisation of the Finance Member who is the president of the Board.

9012. And you would have the working committee meet as a weekly committee of the Central Board with the Finance Member active on it?—Yes.

9013. Which means that the whole thing would be practically run by tho Finance Member of the Government of India?—I do not say it will be practically run by him only.

9014. That is just the point. I want to see whether you agree with that?—No; he can veto certain things; he can hold up or delay, but he cannot run the bank actively.

9015. He cannot veto a thing unless he is in touch with everything. You give him the power of veto and you have to attach to it the condition that he must be in touch with everything, if he is to exercise his power of veto with effectiveness; that is my point?—Yes, I see your point, but I would like you to understand my point also.

9016. I realise it very fully; but I see a difficulty in it. I suggest to you that the scheme which you have outlined on page 401 of your book is not feasible?—I am trying to point out to you that this Board of 25 directors need only meet once in three months at the most; therefore it does make it feasible by itself.

9017. I am quite prepared to see the use of it?—Very well, then; there is a smaller council out of this central board and that meets, let us say, once a week.

9018. Which means that only people from round about Delhi can go to attend those meetings? I want you to realise very fully that India is a place of long distances, and a man from Rangoon or Madras or Bombay or Calcutta cannot attend weekly meetings held at Delhi. You say you want the Finance Member to preside over these weekly meetings and the members must therefore be round about Delhi or say within 100 or 150 miles at the most?—May I point out that this difficulty can be got over by an arrangement amongst the members themselves for taking turns to be there for three months at a time. They are only seven and two can take turn for these three months.

9019. Reside at Delhi?—Yes, just as they do for sessions of the legislature. It no doubt involves a sacrifice of business; I do not deny that; but they need not stay there for the whole year, but only for a period of three months or any other convenient period, say two months; they might take turns and stay in Delhi.

9020. What sort of remuneration would you be prepared to offer to such a man to come and reside in Delhi or do you expect him to come and do the work gratuitously?—I do not like to suggest that it should be done gratuitously, because work done like that is hardly ever well done; but one analogy is the directors' remuneration that is given in England; a merely nominal fee would be insufficient; the remuneration would have to be a little more substantial.

9021. Could you name the sort of remuneration that you think a man whom you expect to stay for three months in Delhi should get?—I should say as a general figure, have it at the same level as the allowances paid to members of the Assembly or something like it.

9022. Twenty rupees a day?—Or say double that.

9023. Rs. 1,200 a month?—For the period of residence in Delhi.

9024. Do you expect a business man in Madras or Rangoon to come and stay in Delhi for three months a year on Rs. 1,200?—If he has a sense of public duty. And I do not forget also that there is such a thing as the telegraph or the through telephone to Bombay or Calcutta and other places. After all, work can be done by that method with his branch in all important matters in which his consent would be required.

9025. Did I understand you to say that you would expect questions of granting credits and other things to be dealt with by the office in Delhi by telephone or telegraph?—Oh, no; I did not say that; I said that the director residing in Delhi for three months could dispose of his private business, if necessary, by means of the telegraph or telephone.

9026. If he wanted to?—Yes; I quite freely recognise that Rs. 1,200 is insufficient for the total neglect of his business.

9027. Bearing in mind all the facilities of telegraph and telephone, etc., you think that it is feasible and reasonable to expect a successful merchant in one of tho parts of India to reside at Delhi for three months a year in order that he may be a director of the Imperial Bank? You do not think that would cut out the most useful section whom you really want on the Board?—No, Sir Purshotamdas, for this reason: that I take it that the men who will be selected for such posts would be men who are already at the top in their own business; they cannot be in a subordinate position as a manager or such like. . . .

9028. I fully see that: I do not want to interrupt you, but do you not think in India it often happens that men beyond a certain age do not have the necessary energy to do this work? Do you not think that this is a handicap?—I am inclined to think there are exceptions; men at sixty are active enough.

9029. You would then depend upon the exceptions not on the average?—After all I am thinking of twenty-five men or rather one-fourth of that number, out of a total number of several hundred millions.

9030. Referring to sections 80 and 81 (this is my last question) where you expect the Imperial Bank to remit money to and from all the branches for customers and non-customers, do you not think that you are giving a substantial set-back there to the indigenous section of bankers, namely the sowcar and the petty money-lender, without giving them any other *quid pro quo*, without giving the people any facility in the form of opening small branches of banks in various wayside places? If you take money to and fro without any charge, you are practically killing the Chetty, the Marwari and the Multani shroff?—I am also suggesting the opening of branches in a far more liberal spirit than is, even under the present constitution, provided for; and I extend banking facilities in such a way that the opening of branches would not be reduced; if anything they will be multiplied.

9031. Taking the total number of branches at 160, it is very inadequate according to your opinion?—Certainly; is it 160?

9032. Round about that?—I am very glad to hear it.

9033. They had 60 before and they have completed 100; or rather they have 164 in all. That is very inadequate?—That is very inadequate though.

9034. How many branches of the bank would be adequate before you can hit the Chetty, the Marwari and the Multani, who really finances the masses of India?—To cut them out altogether?

9035. Adequate to enable you to hit the Marwari, Multani and the Chetty classes thoughtlessly?—But I do not want to hit them thoughtlessly.

9036. When you take money to and fro without any charge at all, you cut these people out?—Yes, as far as remittance business goes.

9037. Can you afford to do it unless you had, not 160, but perhaps a lakh and sixty thousand branches of the bank?—That is what I have suggested—every village with a post office or a railway centre to have a branch or agency.

9038. For doing banking business?—Yes; either an agency or branch for every village which to-day has a post office.

9039. Do you mean that every village which has a post office should have a branch of the Imperial Bank?—Here are the words in paragraph **74**: " Subject to the provisions of the Bank Charter Act, the Bank aforesaid shall open branches as follows:—

(1) Wherever the necessity for the issue of currency notes requires a branch, i.e., in every town in India with a population of fifteen thousand inhabitants or more; or in every town which is the headquarters of district administration; or the capital of a province, or native state, or the junction of two railway lines or more."

9040. May I say that I have seen that? Have you any idea as to how many branches would be required?—It might eventually mean twenty thousand.

9041. Until those branches are opened you would not carry money to and fro free?—I say eventually it might mean twenty thousand; but it does not prevent us from having to-day arrangements with the post office in collaboration with the Imperial Bank that money may be remitted to and fro wherever there is a post office.

9042. You would therefore recommend that next year money should be carried to and fro free of charge and wait to develop your branches, as it is bound to take time?—It will take time.

9043. In the meantime you would take the money to and fro free of charge?—I would.

9044. You do not think that would hit these very useful classes?—If I may point out, the only person who would be hit is the post office in this case, because money orders pass through the post office, which charges a rupee for every hundred rupees remitted.

9045. But what about the village money-lender or the small shroff, the Marwari, the Multani and the Chetty—these are the three classes which practically finance the masses of India? As soon as you take money to and fro free of charge, what business is left to them?—This is only remittance business. The business of finance proper in the sense of lending money for a period is different and that business will still remain in their hands until these twenty thousand branches or agencies are established.

9046. I fully see that. What I was thinking of was that these men have several branches of the same firm in several parts of India and by transmitting money they earn a little on the money in transmission; what he earns as interest on the loan he takes risks for?—To that extent he himself would be a beneficiary by having these monies sent free of charge;

9047. You do not think it will hit him?—I do not think this will hit the general business of the Marwari or the shroff.

9048. (*Sir Alexander Murray.*) We have two mints in India just now and you propose that in future we should have one mint only?—Yes.

9049. And you give as the reason for it the commercial importance of Bombay?—And administrative convenience also.

9050. I have figures here showing that Calcutta now clears more cheques than all the rest of India put together including Bombay, and yet you consider that Bombay is of more commercial importance than Calcutta?—Bombay is more commercially important for this reason in my mind: that the commercial importance of Bombay is native Indian and not non-Indian, whereas Calcutta importance is largely non-Indian.

9051. Therefore you put it on a purely racial basis; because Bombay is Indian and Calcutta is European the mint should be in Bombay?—That is my point, yes.

9052. In spite of the fact that Calcutta now clears more cheques than all the rest of India, including Bombay, put together?—Yes.

9053. You say also for administrative convenience: do you not think that in view of the size and magnitude of India, you have got to cater from Rangoon on the one side, down to Madras on the other and up to Assam in the north and therefore it would be more convenient administratively to continue to have two mints?—I have an open mind on that; but I should prefer one mint from the point of view of administrative convenience, particularly in view of the fact that all the gold comes to Bombay first: Bombay is the port where all gold coming whether from Africa or from London will be consigned; therefore that will be the most convenient place. That mainly is the reason that induced me to make that suggestion.

9054. But in view of the fact that we have two mints and in view of the tremendous amount of business done on this side as well as on the other side of India, do you not think that it would be administratively convenient to have two mints?—It was administratively convenient in the days when we had silver standard and currency, because silver could come even from China or Japan, whereas I take it that when we have only a mint open for gold, and silver is demonetised in the sense I have suggested, then Bombay in my opinion would be more convenient in view of the fact that gold imports would come there.

9055. So far as the import of bullion is concerned, but not the distribution of the coins?—No, not the distribution of the coins.

9056. In one of the explanatory paragraphs to clause 18 referring to the suggested rate of exchange you give as one of the reasons if not the principal reason for maintaining fifteen rupees to the pound, that it is the rate which would cause the least disturbance in the mercantile world. Under existing conditions, is the rate that will cause the least disturbance in the mercantile world not the existing rate, namely, 18d.?—Under existing conditions, yes; if you go on keeping to that rate it might cause fewer disturbances. But I should never forget the fact that the existing rate has been brought up from a lower rate.

9057. You use the argument—and a very good argument, if I may say so, that the desirable rate is the rate that will cause the least disturbance in the mercantile world. Therefore, under the existing conditions 1s. 6d. is the rate which would cause the least disturbance in the mercantile world?—Everything considered, I don't think so. Everything considered, I think 1s. 4d. would cause less disturbance. But I always have my point that this is merely an internal ratio of a demonetised money to a standard money.

9058. But will you explain to us what you have in view when you say that under existing conditions 1s. 6d. is not the rate which will cause the least disturbance in the mercantile world?—When I say all things considered, I mean that 1s. 6d. itself has been brought up by artificial means.

9059. So was 1s. 4d.—But 1s. 4d. has the prescriptive fact behind it of having been in actual operation and working for 15 years.

9060. But 2s. was in existence for 20 years and yet did not stick to it?—2s. was in existence for 100 years before 1873, the 20 years that followed made the variation so much that you had to make

the alteration and you made the alteration into the merits of which we need not go. But after 1899 to 1914, you had 15 years of this ratio which, whatever the dislocation and difficulties must have been, allowed time for such difficulties to distribute themselves and be more even. Here is a question of a sudden further change from 1s. 4d. to 1s. 6d. which was a matter of the last two years. I am only speaking of the actual rate as it was in 1923 and in 1925. Now, you might take another year or more to completely realise the change I suggest. Though as it is a matter, I once again repeat, of the relation between a standard money and token money, it is relatively unimportant from the point of view of foreign trade and foreign exchanges. What would matter (and I grant it would matter) would be internal transactions made so far in rupees; and therefore I have already answered Professor Coyajee that such hardships will come and must ultimately be faced.

9061. And therefore the rate of exchange you say has no relation to the price levels in the different gold countries?—I don't say that.

9062. You mean that rate is immaterial because it is not a rate for the standard money?—I mean it is a rate of internal exchange between the standard and the token, which is not an exchange rate of foreign exchanges between currency in this country and currency in other countries.

9063. Therefore it is immaterial what the rate should be?—It is immaterial in that sense.

9064. You would not take into account that the price levels in India, the United Kingdom, the United States and other gold countries are round about the same level and therefore now seems the proper time for stabilising exchange at this rate?—No, I don't think so, because the price level will follow our gold standard then.

9065. One other point. You say in explanation of Clause 18, "The saving in the home charges would be a material consideration, perhaps, if the Indian people had the control of their finances and were able to employ the funds saved by this means in the remission of taxation or employment in industry." Can you indicate to what purpose the Indian Government have been putting the funds in the meantime? What had you in view when you wrote that?—The present Home Charges, to which this sentence relates, consist largely of payments to the War Office, payment by way of interest on loans made for productive or unproductive purposes, and payment by way of pensions and salaries or leave allowances to the officers of the Government of India, in England, and stores and so on. Now this saving, from 1s. 4d. to 2s., in the shape of our having to remit less rupees to get the same amount of sterling at the 2s. rate, would be, if at all, an effective argument provided the saving was really a saving to the people. I mean if the money saved was coming back in some form to the people. Rightly or wrongly, I look upon military expenditure as wasteful. War Office charges therefore paid by the Government of India to the War Office in England I regard as a matter of waste. If we even accomplish this saving by the manipulation of exchange and return that money to the tax-payer in the shape of remission of taxation that might be an argument. But if this money saved goes up merely in increasing the salaries of the Civil Service or in increasing the military expenditure, it is much worse than before.

9066. Supposing we had 40 million sent home on the basis of 1s. 4d. and 40 millions on the basis of 1s. 6d., that is a material saving. An actual money saving to the Government. Where do you suggest that money goes under existing conditions? Because you say that presumably the present Government of India is not able to employ the funds saved by this means in remission of taxation of employment in industries. Well, where else does it go?—Why, the increases under the Lee Commission's recommendations alone run away with one crore. On the illustration you yourself gave, 40 million remitted at 15 rupees to the pound will cost us 60 crores; at 13·1/3 it will cost us say 55 or 54 crores. On your suggestion it means a saving of 6 crores. You want me to answer the question where does that go? I say if you add in this way additional allowances to the Services, free passages, increased military expenditure, increased stores, you simply dissipate the thing, which really therefore makes no substantial material benefit to the people of India. We get the same service for increased charges.

9067. Therefore ,the reason why we should not stick to 1s. 6d. is that, if we do, we will save so much money that we will be able to give effect to the Lee Commission's recommendations; and in your opinion it is undesirable to give effect to these, therefore we should not remit at 1s. 6d.—My argument was that it may be a real saving if the money was not spent in this way but was to return to the people.

9068. What is the difference between what I say and what you say?—A great difference. I will point it out, if you will allow me to. When I say the money was returned, read it in conjunction with the whole paragraph, and previously I did state that even this saving was nothing in comparison with the loss involved in getting less rupees for our exports at the higher exchange rate. Because if your home remittance of 40 million pounds was made not merely at the 1s. 6d. but the 2s. rate, it will save you 20 crores. Then at 10 rupees, will have to remit 40 crores. At 15 rupees, 60 crores. We will say 60 crores. I say that saving is nothing in proportion to what we receive in export, to what we lose at the higher rate on export of goods. I say that above.

9069. I am speaking of what you say here. You say this saving in the home charges will be a material saving perhaps if the Indian people have control of their finances and we are able to employ the funds saved by this means in the remission of taxation or employment in industries.—I suggest that you should read the whole paragraph together.

9070. I have read the whole paragraph. I am quite willing to deal with the others in the same way. But I take this as a typical point in the paragraph.—My point is that if this money saved, 5, 6, or even 20 crores, was actually money returned in the shape of remission of taxation to the Indian people, then it would be a justification for saying that it is a real saving. But if the money saved was only spent up in increased expenditure, and a wasteful kind of expenditure at that, then I don't think it is right and proper to say this is a proper saving.

9071. And for that reason, exchange should be reduced from 1s. 6d. to 1s. 4d.?—You may say so if you like.

9072. (*Sir Reginald Mant.*) Professor Shah, was this Act of yours drafted with a view to introduction in the Legislative Assembly?—I should be very happy if it is introduced in the Legislative Assembly.

9073. But it was intended as a serious piece of legislation, was it not?—I am not a member of the Legislative Assembly. As much as an outsider can pretend to make it a serious piece of legislation I do so intend it.

9074. Do you consider that the first two clauses of this Act are *intra vires* of the Legislative Assembly?—No, not as the constitution stands to-day.

9075. Now, if you were to introduce a Bill in the Legislative Assembly, the first two clauses of which were patently *ultra vires*, might not an unfriendly critic say that this was not intended as a serious

attempt at legislation, but rather of the nature of a political manifesto?—The unfriendly critic would be most unfriendly and not at all a proper critic if he said that, in view of the fact that I myself point out these difficulties and suggest remedies. I am not unaware of them.

9076. In the explanatory notes to Clause 18 you say that you suggest a rate of exchange of Rs. 15 equal to one pound.—Yes, that is it.

9077. Now, turning to the details of the Bill, I find that the rupee is to be 1/15th of the mohur.—Yes.

9078. The mohur is to contain 108 grains Troy of pure gold?—Yes.

9079. The mohur will therefore not be equal to the sovereign and the rupee instead of 1s. 4d. will only be approximately 1s. $3\frac{9}{32}$d.—Yes, that is so.

9080. Why do you say then that you are retaining the 1s. 4d. rate?—Because it is the nearest. It is not the exact fraction but it is the nearest. It is a very small fractional difference. As we are talking merely of token money and its internal ratio to the standard coin, that particular precision I thought was not necessary. It is only for working purposes that I call it 15 to the mohur or 15 to the pound.

9081. *Chairman*: Professor Shah, the Commission is very much obliged to you for your assistance to-day.

(*The witness withdrew.*)

TWENTY-FOURTH DAY.

Monday, January 4th, 1926.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.
Mr. G. H. BAXTER, Mr. A. AYANGAR } (*Secretaries.*)

Mr. NALINI RANJAN SARKAR, accompanied by Mr. J. GHOSE, representing the Bengal National Chamber of Commerce, Calcutta, called and examined.

9082. (*Chairman.*) Mr. Sarkar, you are a member of the Bengal Legislative Council?—Yes.

9083. And Mr. J. N. Lahiri?—He has not come.

8084. Who is with you to-day as your colleague?—Mr. J. Ghose.

9085. You are both members of the Bengal National Chamber of Commerce?—He is not a member.

9086. But you are a member of the Bengal National Chamber of Commerce?—Yes.

9087. You have come to-day to assist us on behalf of your Chamber, from which we have had a memorandum* expressing its views. Could you tell us, in the first place, a few leading facts about the Bengal National Chamber. What is its membership in numbers?—About 300.

9088. What is the nature of the interests represented on the Chamber?—Indian business.

9089. What classes of business?—Export and import business, industries, buying and selling, some manufacturing also, jute, &c.

9090. Are they mostly merchants?—Yes.

9091. Bankers?—Some bankers also.

9092. Brokers?—Yes.

9093. Bullion brokers?—No bullion brokers.

9094. Exchange brokers?—There are some.

9095. Mostly produce brokers?—Yes.

9096. What is the nature of the manufacturing interests represented—jute?—There are some jute and cotton dealers also.

9097. When was the Chamber first founded?—I do not know the exact date—some time ago, about 15 to 20 years ago.

9098. Just in order to guide our questions, Mr. Sarkar, would you tell us the nature of your own business interests?—I am the manager of an Indian life assurance company.

9099. I will ask you a few questions upon the memorandum of the Chamber, and we understand that you will be expressing the views of the Chamber and not your own personal views. In the last sub-paragraph to paragraph 1 it appears to me there may be a misapprehension which should be removed. You say: "In England where there is gold standard and gold currency people like to manage their work through notes, cheques and bills." Is there in fact any gold currency in England? That is not the case now, is it? No gold circulates in England, does it?—At present it does not.

9100. In reply to question 1 you say: "The problem of balancing the budget in case of 1s. 4d. exchange rate . . . "—We have omitted that; the figures were incorrect.

9101. You wish to cancel that passage altogether?—Yes.

9102. That will save us some questions. We understand that the passage which relates to the increase of the Customs revenue with the reduction in the rate of exchange has been deleted in view of some imperfections in the calculations. In paragraph 2 the second sub-paragraph, you say: "There cannot be stability in India unless she adopts gold standard and gold currency with fixed ratio between her gold mohur and silver token rupee as almost all the countries with which she has trade relation enjoy gold standard and gold currency." There again I find some difficulty in following your statement. There is no actual gold currency in most of these countries?—In America there is.

9103. But there is no gold actually in circulation in America except to a trifling extent. Is there any country particularly in your mind which actually enjoys the use of a gold currency, not a gold stan-

* Appendix No. 43.

dard? If you go to America you never see an Eagle now-a-days. I do not know any country with which India has trade relations in which you ever do see a gold coin. Perhaps that is not a matter within your personal experience?—Yes.

9104. You say: "The stabilisation of the Indian rupee in terms of gold will tend to bring the prices of her agricultural products on the same level with those of other countries which have gold standard and improve the condition of the agriculturists and other producers." Agreeing that that is the effect of the stabilisation of the Indian rupee in terms of gold, might not the supporters of an exchange standard say that a sound exchange standard also stabilises the rupee in terms of gold?—But our experience is that it could not.

9105. Your critic on this paragraph might say: "In the past you had not a scientific exchange standard, because, for instance, there was no legal obligation to sell the medium of international currency." The point is, is it not claimed for an exchange standard that, when soundly based, it also stabilises the rupee in terms of gold? Would you agree to that?—No. Even if the foreign exchange is stabilised, internal prices cannot be stabilised by the operation of a gold exchange standard.

9106. Your reply is that, even though the exchange is stabilised, internal prices are not stabilised by an exchange standard?—Yes.

9107. If the foreign exchange is stabilised, then internal prices will, whatever the means of stabilisation may be, follow world gold prices, will they not?—That will not be always so, and it will take a long time.

9108. Could you explain to us why, if the foreign exchange is stabilised on an exchange standard without a gold currency, there will be less stability of internal prices than with a full gold standard?—Because a gold exchange standard is not automatic It can expand currency but it cannot contract in times of need.

9109. Is it your opinion that it is impossible that an exchange standard should be made to work automatically?—Yes.

9110. Let me put to you an organisation of the currency in which the paper currency and the gold standard reserves are unified under the control of a Central Bank, and a legal obligation is accepted by the Central Bank to buy and sell either gold for export or foreign currencies at the determined par of exchange. Have you considered whether that would have the effect of making the contraction and expansion of the currency automatic? I am putting to you an organisation of the currency system on an exchange standard in this manner—that the paper currency reserve and the gold standard reserve are combined, and are under the control of a Central Bank, and that the Central Bank undertakes the legal obligation to buy and sell, either gold for export or foreign currencies of gold standard countries, at the par of exchange, at whatever rate may be fixed, 1s. 6d., 1s. 4d., or any other rate. Would such a currency system as that make the contraction and expansion of the currency automatic?—No.

9111. Why would it not, because then, when you sell foreign exchange, your reserves would be contracted, and, if you have only one reserve, if your reserve was contracted your total currency would have to contract. But that, perhaps, may take you into regions of hypothesis which you have not yet considered. In paragraph 3 you are dealing with the rising or falling rupee, and you say at the end of the paragraph: "The falling rupee, on the other hand, impedes import and encourages export, but here also speculation reigns supreme, there being no knowing of its destination." Are those undesirable effects from a falling rupee? Then you go on: "It requires more rupees to discharge sterling obligations, causing thereby a deficit in the budget which can hardly be balanced without imposing duties on export." I take it you mean that those are the bad effects of a falling rupee?—Yes.

9112. A little lower down you say: "In view of what has been said above, the rupee should be stabilised in relation to gold standard at the ratio of 1 to 15." That would involve a fall in the rupee, would it not, from its present ratio?—Yes.

9113. Why then, one asks, do you recommend that the rupee should be reduced?—Fall only in the transition period; but it will be stabilised then at 1 to 15.

9114. Why do you recommend that there should be a fall in the rupee when you have been calling attention above to the bad consequences which result?—Rising and falling, I have drawn attention to both, rising to 1s. 6d.

9115. It is at 1s. 6d. now, is it not?—Yes; but the country has not adjusted itself to that rate.

9116. To what rate of exchange, in your opinion, is the country now adjusted?—1s. 4d.

9117. And it follows, in your opinion, that no adjustment has taken place to the 18d. rate at all? Would that be so, Mr. Sarkar?—Yes.

9118. In spite of its having prevailed for about six months?—Up to August 1924 it was 1s. 4d. About the question of contraction which you asked me before, balance of trade being in our favour, there will be rare occasions for contraction.

9119. I did not quite follow that?—You say that by remittance operation the reserve will be depleted. About the ideal currency you referred to.

9120. You are reverting to my previous question?—Yes. Then there will be rare occasion for us to send money because the balance of trade is in our favour.

9121. If I follow your replies upon this point, you are of opinion that either a rise or a fall is disadvantageous from that rate to which the rupee is adjusted, but you are of opinion that at the present moment the rupee is adjusted to the rate of 1s. 4d.?—Yes.

9122. On referring to the Calcutta index number, I find that the last time when the gold rate, that is the cross rate, was about 1s. 4d. the Calcutta index number was about 180; and I find that now, with the rupee at the cross rate of 1s. 6d., which is coincident with the sterling rate, the Calcutta index number has fallen to 157. Does not that provide rather *primâ facie* evidence that there has been a substantial adjustment to the 1s. 6d. rate?—But we see no evidence for that fall, because our railway rate is the same, the fixed wage is the same.

9123. This is the index number of prices. The evidence that it provides is the evidence as to general prices, cereals, food articles, oil seeds, cotton, textiles, etc. Have all these prices adjusted themselves?—The index numbers are not always reliable here.

9124. Let us dismiss the index number and see what other evidence there is as to the question whether or not conditions are adjusted to the 1s. 4d. rate. What other evidence would you suggest that we should refer to?—For a long time we are accustomed to that rate, 15 rupees to a mohur.

9125. For 25 years that rate ruled, but, on the other hand, a good many rates have ruled since 1s. 4d., have they not? I really want to see whether you have any other positive evidence in your mind as to this question of the adjustment of conditions in Inda to the rate of exchange. Of course one would naturally suppose that the first assumption is that things adjust themselves to the ruling rate; then if it is said that they are not adjusted to the ruling rate one tries to see what the evidence to lead one to that supposition is. I suggest that the index numbers do not support your contention, and I was wondering if there is any other positive evidence as to the maladjustment of Indian conditions to the ruling rate of exchange?—Wages remain fixed.

9126. Wages have shown no marked decline in rate?—No.

9127. It has been stated to us in evidence that, of recent years, there has been a general tendency to a rise in the rates of wages in India owing to general economic conditions, and it is suggested that the effect of a rise in exchange has been not indeed to produce a fall in wages but to prevent a rise. What would your opinion be on that?—I beg your pardon?

9128. We have received evidence to the effect that there has been a general tendency in wages in India to rise of late years owing to general economic conditions, and it is suggested that the effect of the rise in exchange has been not to produce a fall in wages but to prevent a rise which would otherwise have taken place, so that there is a masked effect from the exchange?—We have not considered that question from that point of view.

9129. What is your experience as to the general tendency of wages in India? Has there been a general tendency for wages to rise with the better education of the people, better accommodation and so on?—No; I don't think education has had any effect.

9130. You have not considered that?—No.

9131. Under question 5 you say that: "The control of the paper currency may be given to the Imperial Bank of India, the constitution of which should be so changed as to admit of effective Indian control." I wonder if you would expand that a little to show us just what you mean and what you desire?—Indians should be there; that is my committee's idea.

9132. Would you make it a part of the constitution of the Bank that such and such a proportion of the directors should be Indians?—Yes.

9133. What proportion?—In Bengal we have got 7 directors of which only 1 is Indian; we want 4 Indians.

9134. That is, a majority of Indian Directors on each Presidency Board?—Yes.

9135. Are there any other changes in the constitution of the Bank which you recommend as a preliminary to the transfer of control of the currency?—No.

9136. In recommending a gold currency in the next paragraph you say: "provision will have to be made for easy conversion and reconversion of gold and silver coins." If you are going to undertake the conversion of silver coins, that will require some additional gold, will it not?—Conversion.

9137. Yes, conversion of silver coins. You will have to strengthen your reserve, will you not, in order to undertake that obligation?—I do not think so.

9138. I suppose we may assume that the reserves are at present only so large as is necessary, first of all as regards the silver reserve to secure the convertibility of the notes into rupees, and, secondly, as regards the sterling and gold reserves, to support the exchange value of the notes and rupees. If they are only big enough for that purpose, now you are undertaking a further liability upon the reserves, are you not, and that is to convert the rupee into gold?—Our gold standard reserve and paper currency reserve both combined will be able to support that convertibility to begin with, because there will not be much demand for conversion.

9139. Have you attempted to estimate what the demand would be?—No.

9140. If you have not estimated what the demand will be, how can you say that the reserve will be large enough to meet it?—From our past experience. Even with 21 per cent. and 30 per cent. backing there was no excessive demand, on the paper currency reserve for rupees.

9141. I fear that I am not following you. There has been no occasion in the past in which the currency authority has undertaken to convert rupees into gold has there?—No; notes were to be converted into rupees.

9142. But now we are talking about the fresh obligation to convert notes and silver coins into gold?—But the analogy holds goods. There will be not much larger demand for conversion.

9143. Indeed, then, you have made an estimate, and your estimate is that there will be no demand for conversion?—There will be some demand for conversion; but it will not be excessive.

9144. If there is some demand for conversion, will you not have to supply an additional amount of gold in order to meet that demand?—We have got 100 crores worth of gold now in securities, etc. You can sell those securities.

9145. In your opinion the demand will be so small and so negligible that the trifle of gold that it will require you can spare from your existing reserves without depleting them dangerously for their present purposes?—Yes.

9146. You do not care to put a figure on it, only your argument shows that it really must be a negligible amount?—Yes.

9147. Do you think that is a safe assumption for a responsible currency authority to make when it is confronting this new obligation?—Yes; but gradually we shall get gold also, because we have got a favourable balance of trade.

9148. Have you made any estimate as to the amount of rupees in active circulation and the amount of rupees which are held up in various forms not in active circulation?—90 crores worth of gold in Government paper currency reserve and 220 crores in circulation.

9149. Of rupees?—Yes, rupees.

9150. That estimate is arrived at upon what basis?—From Mr. Jevon's book.

9151. You accept his figures?—Yes.

9152. Then you recommend that the two separate reserves should be amalgamated?—Yes.

9153. You again refer to the recommendation that there should be more of the Indian element among the directorates of the different circles of the Bank "to look to Indian interests." Would you expand the phrase "to look to Indian interests," Mr. Sarkar?—I can give you one illustration. In Bengal we have great difficulties in being members of the Clearing House and it is necessary for starting new enterprises of banking that this facility should be given.

9154. I am afraid I do not quite follow that. You say there is a difficulty in becoming a member of the Clearing House?—Yes; great difficulty.

9155. That is for a new bank?—Yes to start with and also for old banks.

9156. By what process does a Bank become a member of the Clearing House?—At the sweet will of the Imperial Bank.

9157. The Imperial Bank has a veto on the admission of a Bank to the Clearing House?—Yes.

9158. In your opinion are Banks excluded from the Clearing House that ought to be admitted?—At least more facilities should be given for their becoming members of the Clearing House.

9159. That is, they should be more freely admitted?—Yes.

9160. Is it your suggestion that there is a racial discrimination as regards membership of the Clearing House?—Yes, sometimes there is.

9161. Now as to the policy of the issue of notes of small value; why are you opposed to the issue of notes below Rs. 5?—Because it is not liked by agriculturists and country people. Its material is not good, it does not last.

9162. Have you considered the actual figures of the circulation of these small notes?—No I am speaking from my own experience of the country, Sir.

9163. What is your view as regards the evidence provided by the figures of the actual circulation of these notes. They seem to have gone very well and to have increased in circulation?—That might be in

the towns but not in the villages. It seems advantageous in the town to keep a note book in the pocket but in the countryside they do not take it.

9164. If the towns like them and the country does not, would that be a reason for not having them at all?—Yes.

9165. Why? If the towns like them why should not they have them?—It is expensive also.

9166. You are of opinion that the remittance operations of the Government should be managed by the Imperial Bank?—Yes.

9167. And, lastly, you say: "There should be no issue of currency against Hundis. Should there be a gold standard and gold currency the problem of seasonal currency would probably be solved." Would you explain to us how the adoption of a gold currency would assist in the solution of the problem of seasonal currency?—There will be an automatic inflow and outflow of gold.

9168. (*Chairman.*) You can only draw gold as the result of an ascertained favourable balance of trade, but you want seasonal currency to finance the trade before the actual moment at which such a balance is ascertained. Would not, in the normal case, the import of gold and the extension which that gave to the currency come too late to be of any assistance in providing the necessary seasonal expansion? You understand the question, do not you, Mr. Sarkar? You want the seasonal expansion of currency before the goods are exported or moved. The import of gold only comes afterwards when you have actually ascertained the balance. The bank will supply the demands from the currency, and gold will be available in the markets. Would you deal with any supplementary questions that my colleagues may have to ask you, Mr. Sarkar, in connection with your memorandum.

9169. (*Mr. Preston.*) In connection with the remarks you have made to the Chairman with regard to the Clearing House, have you any Indian banking houses who are members of your Association?—Yes the Bengal National Bank and the Co-operative Hindustan Bank.

9170. Are you aware of the composition of the Clearing House?—No, personally I am not.

9171. You said that the Bank were at fault in denying you or your members admission to the Clearing House and that the fault rests with the Imperial Bank?—That is what I have heard.

9172. Ah! but have you got any actual facts you can put your fingers on which will lead the Commission to conclude that the fault lies and rests with the Imperial Bank and not with the Clearing House?—The Clearing House means the Imperial Bank and some of the exchange banks. They are all European banks.

9173. But the Clearing House is an institution to facilitate the clearing of cheques. It is governed by a committee and the committee I understand and my own experience has always been that they have been ready and willing and most sympathetic whenever an Indian institution put before them a proposition for admission. All they desired in order to comply with the rules of the Clearing House was that those rules should be observed. The first rule is that you shall be nominated and secondly by another bank?—It may be so, I do not know, but the members of the Clearing House are all members of the exchange banks.

9174. You will admit that that is the proper method to adopt in requiring that anybody applying for admission to such an important body should be nominated by one of the banks and secondly by another member?—Quite true, but if it is a clique.

9175. Wait a moment, Mr. Sarkar. We will decide as to whether it is a clique or not presently. But first would you admit that this is a correct procedure or not?—Yes.

9176. Now add to that that it is usual in the case of a new bank for that bank to send in its balance sheet with assurances to the committee that that bank's position and that of those who are ruling the destinies of the bank fit them to become members of this important institution?—Yes.

9177. Thank you. Now as you know there are very severe and heavy responsibilities attached to every member of the Clearing House in so far as any new unit coming along is concerned because the Imperial Bank who act as the final clearers have got, and the other members of the Clearing House, mutually we clear one another's cheques and we give one another credit over a night for such cheques as are passed between one another and which might ostensibly run into very very big figures and we have experienced in the past that sometimes when we have given credit, that the funds have not been there in the morning to meet them. Now do you not think that it is again highly necessary and only the bounden duty of such a committee before it admits a new member to make sure in every possible way that such operations as they may incur by reason of the clearing of their cheques shall without doubt be fulfilled on the day following?—Our complaint is——

9178. Wait a little, Mr. Sarkar, we will come to the complaint afterwards. You admit that?—Yes.

9179. Now what is your complaint?—In admitting into the Clearing House Indians are not taken generally.

9180. But are there no Indian members of the Clearing House?—Only the Central Bank.

9181. Have you got any record of any of your members who have applied for membership and have been denied membership?—I don't know.

9182. Thank you. Now I will pass on to another subject. The Chairman spoke about the one rupee note. I think you told him that in your own personal experience you find that the notes in so far as the villages were concerned were not accepted and were only accepted in a sort of perfunctory manner in the big towns. Would you agree that the Banks in Calcutta find to-day that by reason of the one rupee note having been withdrawn from circulation they have got to keep in their vaults three times the silver they did when the one rupee note was in circulation?—I don't know.

9183. (*Sir Alexander Murray.*) Mr. Sarkar, I notice you say in paragraph 6, that to facilitate circulation of gold the sterling securities in the gold standard reserve and the paper currency reserve should be realised at once and kept in India in liquid gold. Do you know what is the value of the sterling securities held in these two reserves at the present moment?—63 crores.

9184. No 60 million sterling. Isn't there 40 million in the gold standard reserve?—Yes and 23 in the other. At 10 rupees that is 63 crores.

9185. But the value of them to-day if you realised them is not at 10 rupees basis. There is I think 40 million in the gold standard reserve and 20 million sterling in the paper currency reserve. That is all together 60 million sterling. Now there is interest on that let us say at an average of 5 per cent. Now 5 per cent. on 60 million is 3 million sterling. If you want the exchange to be at 1s. 4d., therefore that is equal to 4½ crores of rupees. Now if you were to hold that in gold then you lose 4½ crores in income?—But in England they do not invest in securities.

9186. One moment please. If you realise these 60 million sterling you may lose 4½ crores in interest?—Yes.

9187. Now I notice also in paragraph 3 when you are talking about the low exchange you say, "It requires more rupees to discharge sterling obligation, causing thereby a deficit in the Budget." Well now the annual remittances roughly are about 40 million sterling per annum. The difference between 1s. 4d. and 1s. 6d. is 12½ per cent. Well if you take 12½ per cent. on 40 million per annum that means about 5 million sterling. Converting that at 1s. 4d. it is equal to about 7½ crores. You tell us therefore that that will be a deficit in the Budget. Now this is taking two figures alone, namely, converting your sterling securities into gold means a

loss of $4\frac{1}{2}$ crores in interest and making your remittances home at 1s. 4d. instead of at 1s. 6d. means a loss of $7\frac{1}{2}$ crores—that is, 12 crores of rupees on these two items alone. How will you find the money to take the place of these 12 crores of rupees in the country's Budget?—In remittance operations it will not be $7\frac{1}{2}$ crores.

9188. Why?—Because our remittance operations come to about 30 million £.

9189. I think it was 40 millions last year; but never mind; we will not quarrel about ten millions sterling. The figure we have got shows that the remittances last year amounted to £40,770,000?—That includes railway and capital expenditure also.

9190. Everything?—But railway is now separated from the central budget.

9191. That is immaterial; the money has got to be remitted in some way. The railways are now run by the Government and it is the tax-payer who will eventually have to pay. But what I would like to know is whether you are aware that these 12 crores on these two items alone would result in a loss to Government?—By reverting to 1s. 4d. we shall get something more from the customs revenue; we shall also get something more in income-tax returns on account of the prosperity of the industries.

9192. You have not gone into any figures there to see how you would get the money?—No.

9193. And you lightly contemplate a deficit in the country's budget of all these crores of rupees?—The budget of the country should not depend upon the profit on exchange operations, and the interest on its reserves; the reserves are not meant for investment but to support currency.

9194. The point is that under the existing conditions there may be a difference of 12 crores of rupees if we give effect to your recommendations at once?—If you give effect to these recommendations that problem will always arise because you have already invested the gold standard reserve in England.

9195. But why give effect to that recommendation if it is to cost 12 crores?—Without gold standard and gold currency you have lost crores and crores, 35 crores in 1920 alone; in future also there may be a chance.

9196. That was one year's loss only; even admitting that that was so, this is to be an annual loss?—Perhaps an annual loss of 4 crores.

9197. No; 12 crores?—It will not be 12 crores.

9198. (*Sir Maneckji Dadabhoy.*) You state that when the control of the paper currency may be given to the Imperial Bank of India, the constitution of which should be so changed as to admit of effective Indian control; and in answer to the Chairman you stated that effective control in your opinion would consist of a preponderance of Indian directors; besides that, have you any further suggestion to offer as regards the change in the constitution?—No.

9199. Nothing further?—No.

9200. Then in the opinion of your Chamber the mere fact of a preponderance of Indian directors will be a sufficient guarantee to the general public that the control of the currency can be safely transferred?—Yes.

9201. How would you give this preponderance of Indian directors? By election? If it is by election, and if Indians are not elected, what would you do? What is the remedy you would suggest? It all depends upon the shareholders, and if Indians are not elected, what do you suggest as an alternative?—Nomination by the legislature.

9202. By means of the Assembly?—By Government, I mean; and the legislature will provide under which terms and conditions the nomination will be made.

9203. The mere fact of Government nominations—Indian nominations—by Government, do you think that will satisfy the people and that it will not be looked upon by the people with suspicion?—My Chamber thinks that it will not.

9204. Lower down, you state, in discussing about the issue department, that the bank should have two separate departments, the banking department and the issue department, which should keep accounts entirely separate from each other; the banking department will not be allowed to borrow from the issue department without proper security; am I to understand that you want the issue department to be run by the Imperial Bank of India merely as agents of the Government? May I gather that from your memorandum?—Yes.

9205. Merely as a representative and agent of Government, under certain strictly laid down powers. Is that your idea?—Yes.

9206. Are there many Indian banks in Calcutta?—Not many.

9207. In answer to the Chairman you said there had been racial discriminations in admitting Indian banks into the clearing house. Can you give me any concrete instances of Indian banks being refused admission?—I cannot give any instances now.

9208. In answer to the Chairman you said that if we introduced the gold standard there will be not much demand for gold; you practically said that the demand for gold will be negligible?—Negligible in this sense, that Government will be able to meet it without any difficulty.

9209. By your suggested method that the gold standard and paper currency reserves should be removed from London and kept in liquid gold?—Yes.

9210. You think that that alone will be sufficient to meet this?—Yes.

9211. But if you have not estimated the actual demand for gold that will be necessary, with what authority can your Chamber say that this gold standard reserve and the paper currency reserve will be sufficient?—We say that small transactions will still continue to be made in rupee coins. Why should there be any large demand for gold?

9212. But do you not think that a large quantity of silver from hoards will come out for the purpose of conversion when the gold standard is introduced?—We do not know of any large hoards of silver.

9213. Do you imply that you do not believe there are any?—Yes.

9214. There are no large hoards of silver in the country in the opinion of your Chamber?—Yes.

9215. Are there hoards of gold?—Some.

9216. You do not think much silver will come out for exchange purposes?—I do not think so.

9217. If gold standard is introduced in the country without gold currency, will it be popular with the people?—No.

9218. You mean to say that at the initial stage gold currency will be required?—Yes.

9219. To its full extent or only to a very partial extent?—To its full extent.

9220. But as the Chairman pointed out to you, even in England and America and in other countries where the gold standard has been introduced, there is no actual gold currency?—We have not yet reached that stage; we must pass through this stage first; we shall reach the ideal then.

9221. At the preliminary stage you require some amount of gold currency?—Yes.

9222. Have you estimated that amount of gold?—The rupee should be made a token coin and coinage of fresh rupees should be stopped.

9223. (*Chairman.*) Does that appear anywhere in your memorandum; that the coinage of fresh rupees must be stopped?—Yes.

9224. (*Sir Maneckji Dadabhoy.*) You do not think we will have to obtain gold from other countries; you think our own resources will be sufficient in the paper currency reserve and the gold standard reserve?—To start with it will be sufficient; but gradually we shall get gold as the result of our favourable balance of trade every year.

9225. But let me give you an instance. You know that America practically holds altogether three-fourths of the world's gold in her hands. If we introduce a gold standard and by some freak America refuses to part with her gold or puts some

obstacles in the way, what will be the result of the introduction of the gold standard? Can you help us in throwing any light on the subject?—But our goods must be paid for; those who take our goods must pay for them.

9226. Then only by our exports we must acquire gold; that is your idea?—Yes.

9227. Then you stated in answer to my colleague, Sir Alexander Murray's question about deficits in the Budget, that the Budget of the country should not depend on the profits on exchange. Am I to take it that you imply that the Government has no business to make up its deficits hy raising exchange?—Yes.

9228. And that all the deficits should be met by taxation or by economy or by other remedies?—Yes.

9229. (*Sir Purshotamdas Thakurdas.*) Just one question regarding the Clearing House; I understood you to say that the Central Bank was the only bank admitted to the Clearing House?—That is my impression.

9230. How many Indian hanks are there in Calcutta?—Three or four. The Punjab National Bank, the Bengal National Bank and the Hindustan Bank.

9231. Is your complaint regarding the Clearing House based on any instance of any bank having been refused admission to the Clearing House?—We have heard this complaint that they do not give facilities, and if it is an Indian bank they do not admit it.

9232. Surely, Mr. Sarkar, mere hearing of a complaint like that would not make you put in a complaint of this nature unless you can name any instances where a bank which sought admission to the Clearing House was refused admission?—I could send you instances to-morrow, if you like.

9233. You cannot name any just now?—No.

9234. (*Chairman.*) It is perhaps unfortunate that we cannot have them on this occasion, Mr. Sarkar, when we could examine you on them, but I suppose the next best thing is to havo any particulars you can give us?—I am sorry, Sir. Another member of our Chamber was to have come here to substantiate this, hut at the last moment he fell ill and I had to come; he is the managing director of the Hindustan Bank.

9235. (*Sir Purshotamdas Thakurdas.*) Regarding the answer to Question No. 15, can you tell us if your Committee mean that no more hundis should he accepted for issue of currency on any concrete calculations as to how the existing currency would be sufficient at the height of the season to finance the crops which had to be marketed?—That is after the gold standard and the gold currency is adopted. We say that it will be automatic. After the gold standard and gold currency come into operation, then there will be no more seasonal demands for hundis and covered securities.

9236. So that until gold standard and gold currency are in full operation does your Chamber feel that the issue of currency on these hundis should be continued?—Yes, but not against accommodation hundis.

9237. What do you mean by accommodation hundis?—Hundis issued to accommodate persons. Our opinion is that some of the hundis are not met within due date. Lots of protested hundis are presented every month in Bengal Circle.

9238. Do you mean the Imperial Bank are putting in protested hundis against emergency currency? I would like to understand that, if I have not understood your statement clearly?—If you issue currency on the basis of hundis and these hundis are not met within time, then it is not safe.

9239. But that is the loss of the Imperial Bank?—We want that the Imperial Bank should also not lose on this system.

9240. The Imperial Bank does banking business and may have a few clients on their books who ultimately turn out to be bad. How can they foresee that a certain client will not pay a hundi on due date? That is the banking risk which the Imperial Bank must take. Is there any other consideration that guided your Committee in tho remark that they made?—No.

9241. (*Sir Norcot Warren.*) Mr. Sarkar, referring to what Mr. Preston told you regarding the constitution of the Clearing House, I want to know whether you are now quite satisfied that the election of a candidate to the Clearing House is made by a committee of the Clearing House composed of representatives of other banks as well as a representative from the Imperial Bank and that the election is not made hy the Imperial Bank alone?—Yes, I am satisfied.

9242. (*Professor Coyajee.*) In answer to the Chairman you observed that even under the ideal gold exchange standard system there will be difficulties as to contraction of currency, when necessary. What are those difficulties?—Under the gold exchange standard system?

9243. The ideal gold exchange standard system. When the reserves are amalgamated, the paper currency reserve and the gold standard reserve, and there is a statutory obligation on the authorities to sell reverse councils in case of an unfavourable balance?—Occasions of such selling of reverse councils will be rare.

9244. Yes, but whenever it did arise, the reverse councils would be sold and the notes and silver of the proceeds would he locked up in the bank?—Occasions for such selling of reverse councils would be rare.

9245. Why?—Because we have a favourable trade balance.

9246. (*Professor Coyajee.*) Exactly. Therefore, more and more money will come in and prices will rise. If prices rise, the foreigner must buy less from us, and therefore the unfavourable balance must come.

9247. (*Chairman.*) I think I have nothing else to ask. Is there anything on which you desire to supplement the questions that we have asked?—No. I have submitted a separate memorandum giving my personal views; that is nothing to do with this.

9248. (*Chairman.*) Yes. I think it will be better not to confuse the two. The Commission is very much obliged to you, Mr. Sarkar, and to the Chamber for your assistance this morning.

(*The witnesses withdrew.*)

Professor H. STANLEY JEVONS, M.A., called and examined.

9249. (*Chairman.*) Mr. Jevons, you are a member of the Indian Educational Service, and Professor of Economics in the University of Rangoon?—Yes.

9250. Before that I think you were Professor of Economics in the University of Allahabad; and you are also the author of works on economics, particularly in relation to Indian conditions?—Yes.

9251. You have been good enough to provide us with a memorandum* which sets out your opinions upon the subjects referred to the Commission. I would, if I may, ask you a few questions just to elucidate whatever may appear to require elucidation. In paragraph 2 I see you suggest the Commission should recommend that no action should be taken on its Report until after an interval of consideration by the public and the Legislative Assembly. Do you see any disadvantages in such a course?—Well, the only disadvantage is that it tends to make it a strongly political question, it might tend to.

9252. I was thinking rather of the effect upon the market and the exchange. I imagine that prompt action upon any decision as to the rates of exchange is very desirable in the interests of commerce as a whole?—Of course if any proposals put before the Assembly were to make a drastic change, I admit that it would have a prejudicial effect.

* Appendix No. 44.

9253. The delay would have a prejudicial effect?—Yes, and the uncertainty introduced would have a prejudicial effect, but at the same time it does seem to me desirable that the Legislature of the country should have ample opportunity of discussing any proposed change.

9254. Perhaps we may say that, subject to the necessity for discussion and decision in the Legislature, the less the delay the better?—Yes. I did not mean by this, I may add, that the actual time and method of action should be decided by the Legislature, but the principle of the changes.

9255. In paragraph 3 you say: "The possibility of making contracts for future sale of bills or remittance is a second-rate protection of the merchant." What do you mean by "second rate" in that connection?—What I meant to say was that it was not an adequate protection, not so much protection as he would like. To begin with, it is in the long run expensive and secondly it does not protect him against competition of others who buy at a more favourable rate of exchange.

9255A. It is not a full protection?—No, and it is expensive.

9256. Expensive to whom?—I mean to the merchant; in the long run he must pay the bank their profits and their risk.

9257. Does the merchant pay, or may it not be said that this is one of the happy cases in which you can make the foreigner pay?—Of course this is one of those cases where the burden may be distributed to some extent partly over the home consumer, partly on the foreigner.

9258. You think the home consumer does not escape from a part of the cost of insurance?—He does not, —only in certain special cases.

9259. Then in the last sentence of that paragraph you say: "many exporters will probably lose about a farthing in the rupee, if not more, because they fixed forward contracts as far back as August." Do you think they could have avoided that loss by a more foresightly prudence in covering?—No, I do not think so. The uncertainty having existed in July and August of last year, the prudent merchant was bound to cover his sales and such a loss was unavoidable.

9260. A sudden and unexpected turn in exchange will falsify all calculations in the way of cover?—Yes. May I just add to that? What I had particularly in mind was that there was an anticipation that exchange would rise during this autumn which has not been fulfilled; that if it had been known that exchange would be stabilised at 1s. 6d. people would not have covered a fifth of their transactions.

9261. That was the unexpected turn in exchange to which I was referring?—Yes.

9262. In paragraph 4 you refer to the possibly beneficial effects of fluctuations in prices, particularly a rise in prices. I understand that you are referring there to variations in general world prices, not to local variations?—Well, most of these beneficial effects would apply to variations in prices throughout India. We are really, I take it, concerned in the question of stability of prices in India. I was pointing out that changes had taken place with certain benefits in England where prices have moved more or less in accordance with world prices; and the same reasoning would apply in the case of India.

9263. You make use of the word "prosperity" in that paragraph. Are you identifying prosperity with a rise in prices? "The economic history of the 19th century indicates that each wave of prosperity meant rising wages followed by a rising standard of living"?—Yes, on the whole with rising prices, because an expanding volume of trade, followed by increasing profit, it is what I call prosperity.

9264. Is the ultimate cause of the wave of prosperity a period of increased productivity resulting from good harvests and good weather?—The ultimate cause of the increased prosperity is widespread good harvests.

9265. Is not, at bottom, the increased productivity of the world due to good harvests?—That is what I maintain, yes.

9266. As regards these trade cycles, do you think the booms are worth the slumps?—Well, it is a very difficult question to say whether the balance will be advantage or disadvantage. But I am concerned to point out that there are certain advantages, provided the expansion of credit is not allowed to go too far during the boom resulting in a disastrous financial panic.

9267. You come to the conclusion in paragraph 5 that "It would seem highly undesirable to adopt the policy of stabilization of prices in India, when that might involve the continuous secular movement of exchange without any forseeable limit." I understand that you conclude then that an artificial fixation of prices independent of world prices at the expense of long term movements of exchange is undesirable?—Certainly, yes.

9268. Nevertheless, from what you say in paragraph 7, you would be prepared that this country, like any other, should take its part in an international convention for the stabilization of world prices?—Yes; I was careful to say "approximate stabilization."

9269. To what degree of approximation?—We want to avoid very violent variations and fluctuations of prices.

9270. You do not look upon this as an immediate practical possibility?—Not immediate.

9271. In the meanwhile, I understand from paragraph 6 you lay emphasis upon the stability to exchange for the purpose of encouraging capital investment in India?—Yes; both permanent investment and temporary movements of capital would be encouraged by stability.

9272. What is the importance to the Indian money market and commerce of short term investment of foreign capital?—The movement of capital to India during certain seasons has always been important, particularly important in pre-war times.

9273. Is there a substantial flow of short money?—I cannot say exactly what the present ebb and flow is, as compared with pre-war days. But I certainly say that it is desirable to encourage it.

9274. In paragraph 8 you deal with some considerations relating to the alleged prejudicial effect of a high exchange on Indian industries. Shall I be fairly stating the conclusion to which your argument brings you there by saying that, while prices adjust themselves comparatively soon, wages and certain other factors adjust themselves less quickly?—Yes.

9275. What, in your opinion, is the degree to which wages have adjusted themselves to the present rate of exchange and the prices ruling upon the present rate of exchange, the 18d. rate?—As against the rate of about 1s. 3½d. as we had in 1922?

9276. As against partial or complete adjustment to any previous rate?—I have not gone into the question numerically, but I fancy that there has not been, except possibly to some extent amongst unskilled labour, a reduction in the last three years corresponding with a rise of exchange.

9277. It has been put to us that, though the fall of prices followed by a rise of exchange and the consequent fall in the cost of living, has not led to any visible decrease of wages, it has, nevertheless, prevented a tendency, due to other influences, for wages to rise?—Exactly, that is true; but there has been a decrease of wages in some industries.

9278. What industries? Can you refer us to any special industries?—I am thinking about the cotton mill industry.

9279. In reply to an argument, as you say in this paragraph, advanced by Mr. Madon in his work, you come to the conclusion that the cotton mill company is more or less permanently burdened by the rise of exchange, perhaps to 30 per cent. or so of its cost of production?—Yes.

9280. But in view of the present rate you express the opinion that it does not place any serious burden

on the mill industry?—Yes; it is entirely a question of degree. I would put it that different business concerns have to face different kinds of risks that very often the question of at what level of prices they have purchased their machinery—invested their fixed capital that is—may make a much more important difference to them than this question of change of price level of the product due to exchange. That is just one of the numerous risks that they are taking.

9281. You are setting off against this, I understand, the fall in the cost of the various raw materials and the more sensitive figure, in relation to the cost of living, of the wages of unskilled workers?—Yes.

9282. When we come to paragraph 10, you develop what are in effect your recommendations for the future. You say that "India should take measures which will bring her into line with the most advanced countries of the world," and "this would be achieved by putting India definitely on the gold standard." So that your basis is the gold standard. I see also that you would define the rupee as a certain weight of standard gold?—Yes.

9283. Why would you define the rupee as a certain weight of standard gold rather than revert to the pre-war practice of fixing the ratio to the sovereign, a minor point but nevertheless a point for decision? —That is rather involved in the question of the rate of exchange that would be adopted. I mean to say if the Commission were to think that the rate should be 1s. 4d. or 1s. 8d., then the simplest plan would be to define the rupee in terms of gold taking the sovereign as the basis.

9284. Are there any implications in defining it as a weight of standard gold rather than as the sovereign?—No, except that is the usual practice in gold standard countries, and would have to be done whether the sovereign were introduced in circulation or otherwise.

9285. It might have the disadvantage that it would serve to make an additional formal distinction between a gold standard and a sterling standard?—I do not see how gold standard can be introduced without giving such a definition.

9286. The difference is merely between defining the ratio as a weight of gold or a part of a sovereign; it is purely formal?—In effect it comes to the same thing.

9287. I was wondering why you chose a weight of gold rather than part of a sovereign. You continue: "all paper money and silver rupees being merely representative of the standard gold coins"?—Yes.

9288. Then you would mint a gold ten rupee piece in India to an unlimited extent and issue it in exchange for gold, weight for weight, free of charge for coinage, so that gold might come into circulation so far as the people desire it. That, as I understand it, would be under your system the only way in which gold would get into circulation, by minting gold for the holders of gold?—Exactly; and by making notes and rupees convertible into gold.

9289. Where is that stated?—It is stated elsewhere.

9290. I had rather gathered that the only way in which gold was to get into circulation was by the minting into gold coins of gold brought to the mint by the holders?—No, not only that. I intended that the mints should be open to coin gold for anybody who brings it to be minted, or to the Imperial Bank for that purpose, but also that Government should mint gold coins on its own account for placing in the currency reserve and issue them when demanded in exchange for notes or silver rupees.

9291. Let us see how far you propose to go in that. Do you propose that it should be an option on the part of the Government to give gold against rupees and notes when it suited the Government or that it should be an obligation?—I should prefer to see it undertaken as an obligation, but in the transition stage it might have to be optional.

9292. It is no doubt due to a misunderstanding on my part, but it seems to me to have a very profound effect on the orientation of some of the recommendations in your memorandum that there should be an obligation to provide gold against notes and rupees, because—(tell me if I am wrong)—I had rather understood that the scheme put forward in your memorandum was that there should be something in the nature of an exchange standard, as referred to in paragraph 14. "To maintain the rupee at a rate selected it is only necessary to sell sterling securities of the paper currency reserve and gold standard reserve and to reduce the paper currency circulation by the equivalent amount," coupled with an optional circulation of gold by the coining into gold coins of any bullion brought for coinage?—I did not mean to restrict it to that. I might say that this statement in paragraph 11 that the rupee should be defined by law as consisting of so many grains of standard gold implied in my mind that the notes and silver rupees would be convertible into gold.

9293. It is not a necessary implication, is it? It might be the basis of an exchange standard to define the rupee as being equal to so many grains of gold. I think perhaps the difficulty in my mind may have arisen from paragraph 9: "All countries which have recovered from depreciated paper have adopted the gold standard, paper being the principal currency actually in circulation but being exchangeable into gold theoretically for any purpose but practically for export purposes only . . . I am of opinion, therefore, that India should take measures which will bring her into line with the most advanced countries of the world"?—It may be that I am using the word gold standard somewhat loosely as perhaps people have been doing in recent years, meaning a system where the law defines the standard coin in gold although the gold may not be fully in circulation, and there may be even difficulties as regards exporting it. In many countries still the currency conditions are abnormal as compared with what they were before the War, and it appears to me that whatever measures are taken for the reform of Indian exchange and currency they must be gradual and should proceed step by step from what I may call the modified gold exchange standard to the gold standard as fully developed, say, in England, or as it will be fully developed in England when gold is freely available without any restriction.

9294. Before we proceed upon the basis you have explained, just as regards your last sentence, are you assuming that England is about to return to a gold currency?—Not necessarily to gold currency in circulation. I refer to making gold freely available in any quantities—in small as well as large quantities.

9295. Full convertibility?—Yes, full convertibility, but not necessarily the habit of using gold in circulation.

9296. Do you think that would be a safe assumption to make as to the future?—Yes, I think it is a fairly safe assumption.

9297. Explaining that it comes rather as a surprise to find that assumption should be made, as it has been made to us not only by yourself but by several other witnesses, what are the grounds upon which you base that assumption, that there is to be a return to internal convertibility in the currency of the United Kingdom?—Well, the present conditions are still abnormal as the result of the Great War. The whole world is still suffering from a depression of trade which I anticipate will begin to pass away within the next 2 or 3 years definitely; and when that depression of trade is replaced by rising prices and growing prosperity, I feel certain that England will be able to go back to full convertibility for internal purposes, provided no extraordinary financial conditions arise in the United Kingdom such as continuous deficits in the annual Budgets, which is a possibility.

9298. Let me assume for a moment, for the sake of the discussion, the position of a defender of the Genoa resolutions. Would he not put to you that England has obtained a currency which is most

economic and elastic, and that there can be no temptation to revert to a less highly refined form of currency which is both more expensive and less elastic?—But I am not suggesting that England will revert to having sovereigns largely in circulation: simply that the present restrictions upon the issue of gold will not be maintained. So long as the treasury notes for £1 continue to be issued, I believe the public will prefer to use them rather than sovereigns. If the treasury notes were to be withdrawn and abolished and £5 notes only were to be issued then we should go back to using gold in circulation in England.

9299. What would be the motives for such a change?—Well, I cannot conceive of any motive for doing that. I think it would be a retrograde step to withdraw treasury notes of £1.

9300. Unless it be for the purpose of restoring gold in some measure to circulation, what is the object of making the internal currency once more convertible into gold?—Firstly, it creates general confidence; secondly, it stabilises exchange definitely without any kind of management other than the alteration of the bank discount rate.

9301. In the first place, is it a feature of the present day that there is any need for inspiring further confidence in the Treasury note?—No. By inspiring confidence I did not mean confidence in the note, but general confidence that the country had returned to normal conditions under which trading could begin again with the same assurance as before the War.

9302. Normality in this matter I imagine is, in the first place, confidence in the medium of internal exchange, and, secondly, stability of the exchange value?—That is one thing, yes.

9303. Otherwise that is normal only which has continued for a certain extent of time?—Well, I speak of the normal conditions which existed, say, from about 1825 up to 1914.

9304. It is confessedly impossible to restore, in all their sweet familiarity, the pre-war conditions, because the general price level has permanently changed?—Yes; but apart from the price level I think that the conditions of circulation of the currency could be restored and I think will be as far as that is desirable.

9305. Practically do you think that, in the United Kingdom, there would be any addition to the stability of the exchange value of the pound sterling to be made in comparison with existing conditions if we were to make the Treasury note convertible into gold for internal circulation once we have undertaken the obligation to buy and sell gold at par?—There would be a slightly greater element of certainty.

9306. Where would it come from?—I mean to say that gold could in certain circumstances flow into the banks and be collected; but I admit that the amount of additional security is very small. I am not urging it on that ground particularly, but simply because it seems to me the simplest method to take.

9307. The gold is now held in the bank reserve?—Yes.

9308. Will it make that gold any more available for supporting the exchange value of the pound sterling if part of it is put in circulation?—It does mean that there is some amount to fall back upon.

9309. Which is the more useful form of gold, from the point of view of stability of exchange, gold in reserve or gold in circulation?—Gold in reserve of course is more immediately available and is therefore essential. Gold in circulation is a secondary insurance, so to speak, I think.

9310. A second and doubtful line of defence. We are to proceed, as I understand, on the basis of your recommendation that the currency authorities should undertake the obligation to redeem rupee notes and silver rupees in gold?—As soon as they are in a position to do so.

9311. But you contemplate that silver rupees and half-rupees should remain unlimited legal tender?—Certainly.

9312. You lay no stress upon the importance of reducing the rupee from its position of unlimited legal tender?—I think too much stress is laid upon that point. We have seen that in France and in the United States there was no need found there to demonetise or reduce, shall I say, the circulation of silver or to limit the legal tender. On the other hand, Germany did so. But I see no inherent difficulty in following the practice followed in France and the United States in the seventies.

9313. We are told that it has two specific disadvantages: the first is that one of your standard coins is at the mercy of the price of silver in the silver market, which may bring it to a point at which it becomes profitable to melt it down. What importance would you attach to that?—I say that I would demur to calling the rupee a standard coin under those circumstances.

9314. If it is unlimited legal tender?—It is not a standard coin now, to make a proper use of the term. It is a token coin at the present time.

9315. Let us avoid that phrase then, if it would cause any difficulties. What importance would you attach to the disadvantage that there is the danger that a rise in the price of silver may threaten you with a depletion of your currency in circulation by melting down rupees?—I do not think that that danger is any greater because of the fact that you have got a larger volume of rupee currency actually in use in circulation; whether it is large, or whether it is comparatively small, as the silver money of England was, for example, in 1919, the time when the price of silver rose rapidly, it makes no difference in either case. The price of silver will rise above the melting point and difficulties will be experienced, however little silver may be actually in circulation.

9316. You mean that the difficulty is not overcome by the rupee being no longer unlimited legal tender?—No, it is not overcome.

9317. You must still have a large rupee circulation?—I mean the rupee would still be melted down if the price of silver rose above the melting value.

9318. It is put to us that if the rupee is not unlimited legal tender, if it is purely a subsidiary coin, then there can be no difficulty in substituting for it small notes or nickel coin or some other substitute in the event of such a move in the silver market?—The assumption that I am proceeding on throughout is that the Government proposes to follow what it has frequently announced as its policy, of wishing to give the people the kind of currency that they demand, and therefore it appears to me that any attempt to limit the amount up to which the rupee is legal tender is putting a certain pressure upon the public to use one form of currency rather than another, which, at the present stage of development in India, is quite unnecessary and perhaps even undesirable.

9319. What would your view be upon another aspect of this question which has been suggested to us in this connection, that the rupee is a coin to which the great uninstructed millions of India are accustomed as their familiar coin, and that, within any foreseeable future, it will be impossible to induce them to accept any other coin than the rupee as the current medium of circulation?—I entirely agree that the people throughout India regard the rupee as the particular coin, so that any tampering with the rupee as to weight or fineness would be most undesirable; but I think there is plenty of evidence that people in certain parts of India will very readily accept gold coins. In the Punjab and Malwa and Burma, and probably in many other parts, gold will be accepted along with rupees.

9320. The second disadvantage to which we are referred as attaching to the position of the unlimited legal tender of the rupee is the incidental circumstance that the note is convertible into the rupee, that this necessitates the holding of a silver reserve against notes and the complication of the reserves of the currency system, and that it is desirable to get rid of that complication by dethroning the rupee and

making the note no longer convertible into the rupee but convertible into some other form of currency?—It appears to me that that point of view raises unnecessary difficulties. I look at the whole question from the point of view of taking such action as is simplest and will involve the smallest possible amount of change. The notes being now convertible into rupees, I would have them remain convertible into rupees, but also convertible into gold at will.

9321. What, in your opinion, would be the effect upon the acceptibility of the note issue if it were no longer convertible into rupees, but, say, into gold?—The acceptability of the note would deteriorate, especially in certain parts of India where rupees are actually in great demand. For the financing of the cotton harvest or the rice and paddy harvest in Burma, for instance, small money is essential; and if people could not obtain rupees in large numbers notes would fall to a discount.

9322. Then next in your argument we come to the question of the ratio to be fixed. You recommend that the rate at which the rupee should be stabilised should be 18d., and for that you give the reasons in the following paragraph. You say: "It is obvious that the Government can keep it indefinitely at that figure." I understand that, in your opinion, in the foreseeable future, there will be no difficulty in maintaining exchange at that rate?—Apart from any catastrophe like the Great War.

9323. And such a catastrophe as that would upset any ratio?—Yes.

9324. That argues, as I understand it, that you consider, in the first place, that the reserves are adequate for that purpose?—Yes.

9325. And, secondly, that there has been a substantial adjustment of conditions in India to the 18d. rate?—I think substantial adjustment has taken place or is taking place.

9326. Subject to what you have said in paragraph 8?—Yes.

9327. Can you refer us, beyond the Calcutta index number, to any illuminating evidence to show that such an adjustment has, or has not, taken place?—I have watched chiefly the Calcutta and Bombay index numbers. The amount of adjustment likely to be needed still is, in my opinion, quite small, compared with the enormous resources of sterling which the Government has now at its disposal.

9328. Allowing that some adjustment has still to take place to the 18d. rate is that, in your opinion, greater or less than the adjustmonts which will be necessary in order to accommodate conditions to a 16d. rate?—I should say less, because the rate has been at or nearly at 18d. for over 12 months.

9329. You summarise this, in your expression, that there will be the least disturbance to trade and industries by making permanent the rate which has already been operative for several months, and you point out that that gives better protection to the currency system against a rise in the price of silver, owing to the higher rate?—The higher the rate the higher the melting point of the rupee.

9330. Having recommended the 18d. rate, I understand that you incline to the substitution for the sovereign of an Indian gold coin, in order to produce a more convenient relation?—Yes.

9331. You see no objection to demonetising the sovereigns now in India?—No. I see no great objection to that, because they are not in circulation; they could always be bought and sold as bullion.

9332. In effect, under your system holders of sovereigns could have them changed into gold mohurs free of charge?—Certainly.

9333. And, therefore, there will be no loss?—There will be no loss.

9334. That is, no doubt, the reason why you recommend that there should be no charge?—That is one reason.

9335. Are there any other reasons for that particular recommendation, that the coinage should be absolutely free?—I think that is desirable in order to encourage people to accept gold and to bring gold to the mints, whether it is in the form of sovereigns or bullion or ornaments or whatever it may be.

9336. You recommend the abolition of the gold standard reserve by fusing it with the paper currency reserve. Will you expand your reasons for that recommendation?—It appears to me that the gold standard reserve can only serve the same purpose, under a proper system of regulating exchange, as the sterling securities of the paper currency reserve, and therefore there seems to me no object in holding it separately.

9337. "Existing as a separate entity," you say, "of the gold standard reserve. Rupees must be locked up in India out of circulation to the amount equivalent to the reverse sterling drafts drawn on that reserve." I gather from that that, in your opinion, it is a defect of the pre-war system that the locking up of rupees against drafts on the gold standard reserve was an optional matter and not a necessity of the constitution of the reserve?—Yes, that is my opinion.

9338. And that must be a weak point in the basis of any system of reserves, that there should be a necessary relation between the amount of the reserve and the amount of the currency against which those reserves are held?—Exactly.

9339. Then you refer to the criticism that, if the whole reserve is constituted in this manner on a unified basis, the deflation might be to rapid, and you point out that this would be to a certain extent replaced by notes. You say: "The best reply to this is that the circumstances would necessarily have to be closely watched at the time the deflation was being carried out, and if the pressure on banks seemed to be becoming unduly severe, the notes cancelled on account of sales of sterling drafts could be to a certain extent replaced by notes issued against commercial bills of exchange." Stopping there, that is very much the present system of providing for emergency expansion of the currency?—Yes, it is the prosent system.

9340. You say further on: "or against Government of India securities actually purchased in the stock market." Do you consider that is a desirable alternative?—Not necessarily.

9341. Might it not be said that the bill, after all, is self-retiring?—Yes, I prefer the issue against bills of exchange. If for any reason it didn't seem desirable to adopt it, I would certainly rather have any necessary issue made against securities actually purchased than againt created securities. That is my meaning.

9342. How would you then provide for the contraction which ought to follow the expansion when the need for seasonal currency is over?—Well, Government, having purchased these securities, may sell them again.

9343. They would have to sell them again?—Possibly at a slight loss, though not necessarily.

9344. You could only say that that is a less refined method?—Yes, I prefer the bills of exchange method.

9345. Then you say that the permanent constitution of the paper currency reserve as defined required an unnecessarily large backing for the note issue?—I think so.

9346. What standard are you assuming as the standard of comparison to show what is necessary or unnecessary?—Well, I was considering partly the history of the drains there have been upon rupees and the ability which Government has always displayed to meet that drain until the very exceptional circumstances of the Great War, in 1918.

9347. In view of the experience in past years as to the possible contractability of the note circulation, you are of opinion that a metallic holding of 30 per cent. of the total circulation ought to be sufficient. Is that not rather the minimum that is found adequate in other countries?—Well, conditions, of course, are so different in most other countries that it is difficult to argue, I think, in this case on a comparison as to percentage.

9348. You do not think the experience of other countries casts much light on India?—No, not on this question of percentage. I don't think it does. I think the history of India is far more useful to it.

9349. What are the Indian conditions which make it, if I am right in thinking so, necessary to hold rather a smaller percentage than in other countries? —It must not be understood that this is meant to be the normal percentage, but the minimum. In practice the Government has been able to buy silver and ship it rapidly to India or buy it in India and convert it into rupees. It is always possible to replenish the rupee holding quickly.

5350. You think that is a real strength, even when one considers the difficulties of variability of the silver market and so on, both of supplies and prices? —Well, one has to take into account of course the question of the probabilities as to what is the extent of the drain that might be experienced. That figure sums up my opinion. I am afraid I cannot go further.

9351. In the next paragraph you express yourself decidedly against transferring to the Imperial Bank the sole right of the issue of notes in India, such notes bearing only its own promise to pay. Do I understand that your opinion there refers to an actual transfer of control and responsibility? Would it apply equally to a transfer of the management of the note issue to the Imperial Bank, the notes remaining the notes of the Imperial Government?—No. My objection to the second kind of transfer would be very much less. The objection to the first is the danger of its bringing confidence in the bank as a bank into question.

9352. If we assume that the reserve, which you have estimated in paragraph 16 is adequate, why should there be any weakening of the position by the transfer to the Imperial Bank rather than by remaining in the hands of the Government?—There would not be a weakening if that reserve was set aside in a separate issue department as in the case of the Bank of England. But if that reserve becomes part of the ordinary cash holdings for banking purposes then the bank would have to hold a very considerably larger proportion, I think.

9353. May I put it in this way, that in any case you would make it a condition of transfer on this basis of the reserves to the Imperial Bank that there was an issue department separate from the banking department?—Yes. I would make that condition, for the next 30 years.

9354. Supposing that condition to be made, would you still feel the same objections against the transfer? —Well, then, on that basis my objection would amount to the question purely of management, in which of course the opinion of the bank itself ought to carry considerable weight. The Imperial Bank has only been established and organised as it is at present for say five years and is still adding to its branches. It appears to me a little early to put upon it the burden of managing so big a business as the issue of notes for the whole of India.

9355. Let me put to you, Professor, one or two alleged positive advantages which might be derived from such a transfer, in order to ascertain your opinion as to the weight which should be attached to them. In the first place, it is said that the business of the control of the note issue is essentially banking business which can be better managed by bankers, than by Government officials with no practical experience of banking. What would your opinion be about that?—Well, I would reply that in many cases the State does issue its own notes. We have in England the treasury notes. In Germany they had treasury notes as well as the Imperial Bank of Germany notes. America has always had Government currency notes. I think that it is just the one kind of currency business which the Government can very well manage.

9656. In point of fact, is it not contemplated that there should be a transfer of the English note issue to the Bank of England at an early date?—Well, I am not aware of that myself.

9357. You would not contradict it?—No, I would not.

9358. And in other countries, generally speaking, with the march of civilisation has the tendency not been to trust to a central bank this particular form of activity rather than to the State?—Well, the general tendency of progress has been somewhat in that direction. The main line of progress, however, has been to take note issues away from private banks and put them into a central bank.

9359. Secondly, it is said that the reserves of a country of whatever sort—banking reserves on the one hand, reserves against currency on the other,—if they are to be employed in the most economical and efficient manner for the benefit of the country should be subject to a unified control, and that a division of control between the banking reserve and the currency reserve leads to lack of co-ordination and to inefficiency. What would your view be upon that contention?—I would say, not necessarily. That it is the business of the Government currency department to keep in touch with the banks, particularly the Imperial Bank, and other banks and the money market. If it fails to do that, of course, well—the system cannot be said to work so well possibly then. It is a question of the management—of the people in charge understanding what the principles are on which currency should be worked.

9360. You would not attach much importance to the contention that the management is easier when it is in one hand rather than in two?—I think it is undoubtedly easier, and therefore I quite look forward to the date when it would be desirable to transfer the rights of the note issue to the Imperial Bank. I think in my evidence I said, "within the next 10 years."

9361. This contention has been put in an even stronger form, that the control is now not in two hands but in three, the India Office, the Government of India and the Imperial Bank, and that there must be a gain in efficiency by having one rather than three authorities exercising an influence over the currency. What would your opinion be as regards that aspect of the triple control?—I should imagine that the Imperial Bank is in constant consultation with Government, both in India and in London, with the Secretary of State. I do not know, personally I am not acquainted, with any special difficulties having arisen from this triple control that you speak of.

9362. In paragraph 19 you suggest that "the members of the Commission should make themselves familiar at first hand with the very intricate business carried on in the Currency Offices of Calcutta and Bombay." How would it affect your opinion as regards the policy of transfer if one were to contemplate the possibility of the staff and work of the Currency Department being actually transferred to the Central Bank?—I should regard that as an essential condition in any case, because of the intricacy of the work and the necessity of carrying it on in the manner in which it has been carried on previously.

9363. You have not in fact assumed that in your previous reply?—Well, I think I assumed that when writing this. It appears to me that the kind of questions which arise in relation to a currency issue are not mainly questions such as Bank officials have to deal with from day to day, excepting the big questions of the volume of the currency and the composition of the reserve; and that all the technical details of the work are of a specialised character and would need always separate high officers in charge of the currency issue.

9364. In your next paragraph you express an opinion, which has already been expressed in evidence, that the transfer, if made, should be a transfer of management rather than of control?—Yes.

9365. The notes remaining as those of the Government. You refer again to the separation of the Banking Department and the Issue Department, and you say, " No regulations could be framed as to the backing of the note issue, unless the Issue Department was distinct from the Banking Department," that is to say, no regulations which would not impede ordinary banking business. Can you explain that. It is the common form of organisation in continental countries that there should be a single Department. Have they found it impossible to frame regulations for the issue?—Well, a regulation can be made of course to control the issue. There was the well-known elastic limit system which was in force in the Imperial Bank of Germany before the war, which is a question of controlling the amount of the circulation, and the Imperial Bank of Germany used to pay an increased rate of interest on issue above a certain fixed amount. But that is not the question I was dealing with here, which was, regulations as to the reserve to be held, and regulations as to the reserve when that reserve served the two purposes of the currency and of the banking reserve, which is going to hamper banking business.

9366. How does that come about: what is the hindrance?—Well, your regulations will have to provide the amount of reserve which the Bank must hold in relation to its deposits. You certainly place restrictions on the discretion of the banker which are quite unusual and which I should think would be found to handicap the bank in its ordinary work.

9367. It is not unusual, is it, to have a regulation defining the relation between the banking reserves and the banking deposits? Has that been found to hamper banking business in Continental systems? —I cannot definitely say as to that.

9368. Do you know of any type of central banking system which has operated under the regimé of such regulations?—I cannot say definitely about that; I am not aware of such regulations.

9369. Finally on these matters, in paragraph 21, you say: " The more the use of small notes is popularised the better." I gather that you recommend the re-issue of the one rupee note?—Yes, I do.

9370. You make certain practical suggestions for reducing the cost. Have you considered whether this would be at all likely to increase the danger of forgery?—I considered that point, and I certainly think not.

9371. What would be the advantages of the re-issue of the one rupee note?—Simply public convenience. The general body of the public prefer to carry one rupee notes to silver rupees.

9372. And the substitution in course of time of the expensive silver note by the economical paper note? —Yes; that is not, of course, an important point at present because we have a huge stock of rupees, but the convenience of the public.

9373. Now let me ask you to expand a little your fundamental recommendations as to the currency system. You recommend a gold standard in the sense that the note and the rupee are to be convertible into gold in course of time?—Yes.

9374. But that the rupee shall remain unlimited legal tender?—Yes.

9375. Will you sketch to us by what stages and by what mechanism you would propose to bring those recommendations into effect?—The first step would be to pass an Act defining the rupee as a gold coin of the weight and fineness that I have mentioned here, corresponding with the gold exchange rate of 1s. 6d., and to establish a mint in India for minting gold. Government might wait to see how much gold was brought into the mint before taking any further step, or it might decide that it would immediately make the rupee notes and silver notes convertible into gold, and in that case it would be wise to provide itself with a somewhat larger holding of gold in the paper currency reserve and to coin that gold into 10 rupee pieces. When it had placed in the paper currency reserve altogether, say, 50 crores of rupees worth of gold at this standard of 1s. 6d., then I think it could safely make the notes and silver rupees convertible into gold, possibly beginning in a tentative manner with certain restrictions as to quantity. That, however, could only be judged by experience. I am of opinion personally that if there were 50 crores worth of gold actually in the reserve, Government could safely make the notes and silver rupees convertible.

9376. That would be 50 crores in addition to the present holding?—No, including the present holding.

9377. Then, to be clear, I understand that you would discard, as it were, the mechanism of the exchange standard, and leave it to the export and import of gold under the impulse of natural forces to keep the exchange value of the rupee steady?—Well, I would not altogether discard it. I think the Government might sell Council Bills for its own requirements in London as it does at present, but it should not provide for trade purposes. So far as the demand exceeds the actual requirements of the Secretary of State, then it should be left for gold to flow into India.

9378. Would you accept any obligation on behalf of the currency authority to buy and sell the medium of international exchange?—No, I think I would accept no obligation.

9379. Then you would undertake, in the first place, as I understand, some form of limited obligation to convert rupees into gold; you would not undertake a full obligation at the outset?—I think I would undertake the obligation by making the statement that was made about 1908, if I remember rightly, that Government would undertake that as a normal course, so far as possible, they would issue sovereigns against rupees or notes. That would give them the right to refuse from time to time if it was so found necessary, judging by the nature of the demand. After they had tested the public demand for gold over a series of years, I believe as much as for 10 years, then the Government might undertake the final compulsory obligation of converting.

9380. Have you been able to form any estimate as to the first and last amount of rupees which you would expect to be presented for conversion?—Well, I think personally that provided no statement were made which would be in the nature of requesting the people to bring the rupees to convert them into sovereigns, no large amount would be brought for conversion. People at present are satisfying the need for gold through the ordinary market channels. I see no reason why they should want a much larger quantity of gold simply because we make gold coins coined in India available. Curiosity might impel some people to possess one or two of these coins at first, which might lead to a certain amount of drain; but after a time these coins would find their way back to the reserve; and to the extent to which they were actually taken out from circulation, which might happen in the Punjab and a few other parts of India, there would be a drain upon the currency reserve.

9381. There are two categories of rupees, as it were, to be considered, are there not; first of all the rupee in active circulation; and, secondly, the rupee that is held as a store of value, or, as it is called, a hoard?—Yes.

9382. Have you distinguished between those two in forming your estimate that there is not likely to be any very great presentation of rupees?—Certainly. I see no reason to anticipate that hoarded rupees would be brought out from hoards for conversion into gold, unless any kind of announcement were made by the Government which might be interpreted or distorted by gossip to mean that if they did not convert them now it would be difficult later on. I should certainly think that any notification to the effect that the rupee would become a limited legal tender, even if the limit were fixed at Rs. 100, would immediately give a shock to confidence and lead

people to bring their rupees out of hoards. That is one very strong argument against any attempt at limiting the legal tender of the rupee. Apart from that danger, it appears to me that practically nothing would happen. People are already buying gold at a price which corresponds with the exchange value, 1s. 6d., and so nothing serious would happen, unless Government raised exchange rate to 1s. 8d., say, at the moment they undertook to issue gold. Then, of course, gold would be selling much cheaper in the form of coin than it would be in the form of bullion, and there would be a rush to take the coins.

9383. Then on your basis you estimate that it is unnecessary to strengthen the reserves, except for the conversion into gold of a certain amount at present held in sterling securities?—Yes.

9384. The cost of your proposal would be the loss of interest on whatever part was thus converted?—Yes, say, about 80 lakhs per annum loss of interest possibly, and the loss due to the cost of coining. I would like to emphasise that I think it is most desirable that no seigniorage charge should be made for coinage, so that gold bullion and coin may be absolutely interchangeable.

9385. You would not anticipate that the result of these provisions would be that any large amount of gold would pass into circulation in replacement of rupees?—No, I do not think so. Presumably 20 or 30 crores might possibly circulate at first. But I think a good deal of that would come back; after that the circulation would gradually grow.

9386. Can the present reserves provide 20 or 30 crores in circulation without reinforcement?—Not at present; but, I say, if the holding were increased to 50 crores before any obligation were undertaken for conversion, it would be particularly safe.

9387. Supposing that, out of those 50 crores, 20 crores pass into circulation and are no longer in the reserve, do you think there will be no necessity to reinforce the reserve by some other means to replace these 20 crores?—No, I don't think so. I am assuming that when 20 crores had passed into circulation, the drain would have more or less ceased. Of course, there would be a recurring drain every autumn or the end of the year. That always happens. But then most of it comes back again. That really is a point which must be judged as the circumstances happen, and Government can always import more gold or it may simply allow the exchange rate to rise a little and gold would flow into the country.

9388. That is assuming, is it not, that the 20 crores which are in circulation are as available for the support of the exchange value of the internal currency as they were in the reserve?—No, I was not in that reply assuming that. The question of maintaining the rupee in the case of an adverse balance of trade is one in which I would recommend reliance upon the sterling securities of the reserve, that is to say, of the united reserve.

9389. You have depleted them to the extent of 20 or 30 crores?—Yes. At present we have over 70 crores valued at 1s. 6d., so that it leaves a large margin.

9390. Then it appears, does it not, that your calculation assumes that the present reserves are in excess of what they need be?—I think they are in excess of any reasonable demands, other than those of a great catastrophe.

9391. And that you can deplete them to the extent of 20 or 30 crores without unduly impairing the stability of the system?—Yes, I think so.

9392. With regard to the last question, assuming that you have not substantially reduced the number of rupees outstanding; that you have not, as it would appear, got rid of whatever drain there is to the rupee circulation; that, due to a rise in the price of silver, you have not rid yourself of the necessity of holding a silver reserve against your notes; and that you have not got any substantial amount of gold in circulation, what precisely have you gained?—You have taken one step on to the road of the development of the currency, towards a more perfected and stable gold system.

9393. And the next step would be what?—Well, the next step would depend very greatly upon the extent to which the public took to using gold. Personally, I should hold that they would not take to using gold if encashment of notes was always possible and forgery prevented; and I think the notes would continue to be at least as popular as they are now and would probably increase in popularity. Government then could go to the whole extent of making notes unconditionally convertible into gold, and silver rupees also convertible.

9394. Are you looking forward beyond that step?—Beyond that?

9395. Yes. Do you contemplate any further change, or would you be content to let it rest there?—I should follow the habits and customs of the people. If they gave up using silver, then one might for convenience of creditors limit the legal tender amount of the rupees. That I regard only as a subsidiary point. The abolition of the general use of silver currency must be gradual, in my opinion, if it is to be safe and stable.

9396. If you are looking forward to finally taking the step of limiting the legal tender of the rupee, if and when that period comes, then, as I think you told us, you would expect a large demand for the substitution of rupees by gold to materialise?—No, because I should think that any such limitation should be postponed until such period as rupees had come to be used so little in circulation that it would create no shock of confidence at all. It would be merely a minor change, following rather than leading, the habits of the people.

9397. If that happy day comes when the outstanding rupees have so far been reduced, that will only come by the rupees having been gradually presented for conversion into gold, will it not?—No; limiting the amount of legal tender for the rupee does not mean that the rupee would cease to be convertible. The Government would always convert any quantity of rupees presented. Therefore they would maintain their value precisely as they were before.

9398. I understood that you would not finally limit the legal tender of the rupee until the situation as regards the rupees outstanding had become manageable?—I meant rupees in circulation. By outstanding, possibly you are including rupees hoarded?

9399. Yes?—I am not. I meant not until rupees in circulation had become much less than they are now; till the common currency was notes, a certain amount of gold, a few rupees and small change. Then would be the appropriate time to limit the legal tender of the rupee.

9400. Then there would have materialised the demand for the conversion of hoards?—No; I do not think it would.

9401. I understood it was your opinion that, as soon as you limited the legal tender of the rupee, rupees would be presented for conversion?—If you did it now it would create a shock to confidence, because people simply would not understand your proposal. The rupees being so commonly in use, people would think that there was going to be less use for them than before. It would create amongst the ignorant masses a suspicion that the rupee might not be convertible at some later time. They would act on the impulse of their thought. In my other suggestion that ultimately the rupee might be limited legal tender, I am thinking of some date 40 or 60 years hence, when the habits of the people have changed and the great mass of the people are educated.

9402. If I hold Rs. 50,000, say, in a box in a back garden, and I am told that the rupee is going to cease to be legal tender and that I can have my rupees converted into gold, why should that make less of a shock to my confidence 20 years hence than it does now, whatever the conditions might have

been?—I think we are discussing two different hypotheses. When I say limited legal tender I mean simply that the amount which may be tendered in any transaction will not exceed the limit, say, Rs. 50. Silver rupees will still be legal tender, will still be convertible or receivable by Government in payment of revenue, so there will be no devaluation of the rupee at all, simply a slight loss of convenience according to the present habits of the people; and no loss of convenience according to the habits which will have developed before the time at which I suggest it should be put into operation.

9403. If that be so, why then, supposing you were at once to say that the rupee should be legal tender up to only Rs. 100, should it create this demand for conversion?—Because we have to deal with milliions of peasants and poorer classes in the towns who are very ignorant and who simply would not understand what this limitation of the amount of the legal tender means. They would assume that they may as well be on the safe side and convert now.

9404. My difficulty is no doubt due to a misapprehension of your argument. What is the change which is going to make that difference in the effect by the lapse of time?—Well the difference between, say, the Indian people as they now are and the English people as they were, say, in 1840 or 1830. There may still be some of them who will be illiterate but there will be among the mass of the people a higher general level of understanding and education.

9405. Are you quite confident that the circumstance that you limit the legal tender of the rupee is going to make no practical and material difference to the value of the hoarded rupees to a substantial amount? Supposing I hold 50,000 rupees to-day in a box, and the Government says that, in future, instead of being unlimited legal tender they are to be legal tender only up to Rs. 100, is that going to make no difference to the value of the rupees I hold?—Simply the difference due to the possible cost of carriage to the Government Treasury. If you happened to be situated far from any Government Treasury, you would have to take them there and convert them into notes if you wanted to make payments with them.

9406. But I can only tender up to Rs. 100 at a time?—Oh no, the limited legal tender is as between the members of the public and not as between the Government and the public.

9407. You contemplate that they should continue to be received in unlimited quantities by the Government?—Oh, yes, that is absolutely essential; for all purposes—for Government revenue and at the currency offices for conversion.

9408. Finally, a memorandum has, I think, been shown to you in which some suggested measures for the introduction of a gold standard and a gold currency are sketched. We have gathered from your answers in what respects your own proposals differ from these proposals; but would you point out to us, perhaps in general, what you consider the comparative disadvantages of the proposals contained in that memorandum?—My impression of the two schemes set forth in this memorandum——

9409. Let me make it clear. There is a scheme for a perfected gold exchange standard. I am not referring to that, but to the further proposals for a full gold standard?—I beg your pardon. My observation in general would be that the proposals here attempt to make too many specific recommendations and assume that the whole of the change must necessarily be carried out at once, which course would, as assumed in the memorandum, involve Government in considerable expense. What I feel is that looking at the history of currency changes which took place in the 19th century and also, in India, in the 20th century, we see how these changes have been made step by step in a certain direction, and that the result can be achieved more certainly, and without doubt, more cheaply in that way than by trying to devise a complete scheme and to put it into operation at a given time. Personally, I feel that if the Great War had not happened in 1914, probably the circulation of gold would have gone on gradually developing to a small extent, that the habit which had been established of cashing notes in sovereigns when required would have developed into a permanent custom and possibly by now into an obligation of Government; and that in due course—it might have been by now—the Government would have undertaken the minting of gold in this country; that the steps were already in progress for, as I might say, transposing the gold exchange standard ultimately into a gold standard, and that a stable system of currency was being developed. The fatal defect of that system as it developed was the ratio being at 1s. 4d., and the system being liable to be destroyed by the rise of the price of silver. It appears to me that we have to go back somewhat, to follow the same course that was followed before the Great War and proceed somewhat in the same manner, step by step. For that reason I think that any proposal to sell large quantities of rupees as bullion is wasteful. We know that the trade of India is constantly growing, the economic development of the country is proceeding, and so the rupee circulation is likely to be increased, even though we do put a certain amount of gold into circulation. I see no reason to suppose that in 10 or 15 years the whole of the silver now in the paper currency reserve might not be demanded in circulation. If melted up and sold now the equivalent silver would have to be coined again, perhaps 10 years hence, or even earlier.

9410. Your principal objection to the scheme is that it goes too fast?—It attempts to go too fast and therefore introduces certain complexities, and creates certain difficulties for itself which need not be incurred. I do not know if you wish me to make any detailed observations?

9411. I have got the substance of the assistance which we desire to obtain from you on that point?—You do not want any further observations?

9412. If there is any other heading which occurs to you in the way of criticism of these proposals, please mention it?—Well, I would like just to further observe that this memorandum seems to overlook the fact that in most countries which have the gold standard the gold has been brought into the country by the ordinary method of commerce. Government has sometimes, for instance Germany, had a *nucleus* to establish a system; but the idea that Government should necessarily have to provide most of the gold by purchasing it is quite unnecessary. By limiting their sales of exchange bills when exchange is favourable, putting up the rate, say, to 1s. $6\frac{3}{16}$d., they could always induce a special flow of gold into India.

9413. That is, of course, necessary under this scheme in anticipation of the bigger demand for gold as the result of the shock which you have described of limiting the legal tender of the rupee?—Yes, quite.

9414. Finally, I understand that the system you recommend is, in substance, this. It is a gold standard system in which you contemplate, in the foreseeable future, two forms of token currency circulating in the country, the note and the rupee, both fully convertible into gold; gold passing freely into and out of circulation by the normal processes through the Mint or in exchange for the token; reserves against those two forms of tokens, and a single reserve held by the currency authority for supporting the exchange value of the token?—Yes.

9415. No effort to force gold into circulation in the country or to accelerate the rate of conversion of rupees, but to allow that to take place in the natural process?—Yes.

9416. You would expect the natural process of the conversion or substitution of the rupee by the note in circulation, which would finally reduce the outstanding rupees to manageable dimensions?—Yes.

9417. And prepare the way for the reduction of the rupee somewhere to the position of a subsidiary coin?—Yes.

9418. Will you now be so kind as to deal with any questions which any of my colleagues may wish to ask?—Certainly.

9419. (*Sir Purshotamdas Thakurdas.*) Which are the main heads, Professor Jevons, in your opinion, which would require adjustment before stabilising, at any rate, before one decides on any rate of of exchange?—I am sorry I am not quite clear as to your question.

9420. You said, in reply to the Chairman, that you thought that the adjustment that had taken place at 18d. was larger in proportion to the maladjustment that still had to be adjusted?—No; what I stated to the Chairman was that I thought there was less adjustment to be made in prices, wages and so forth, to the rato of 1s. 6d., which has heen in force practically for nearly 12 months, than the adjustment which would have to take place if the rate were reduced to 1s. 4d.

9421. Therefore the adjustment that has taken place to 1s. 6d. from 1s. 4d. is greater than the adjustment which has still to he achieved between 1s. 4d. and 1s. 6d.?—Yes; the adjustment which has taken place in the past two or two and a half years from 1s. 4d. to 1s. 6d. is greater, as you say, slightly greater, than the adjustment which would have to take place from 1s. 6d. to 1s. 4d., because we have not finally adjusted ourselves to the 1s. 6d. level.

9422. Did you say just now for two and a half years? I thought that in paragraph 12 you say a permanent rate which has already been operative for several months?—I was thinking then (when I said two and a half years) of the time when exchange was last at 1s. 4d. up to the present time.

9423. You mean 1s. 4d. sterling or gold?—We were speaking of the amount of adjustment which had taken place in exchange changing from 1s. 4d. to 1s. 6d. Now, I find that it was late in 1922 or early in 1923 that exchange went above 1s. 4d., so that is getting on for three years.

9424. 1s. 4d. sterling?—Yes.

9425. Which are the heads under which the adjustment is not complete? Wages?—Wages is one certainly; and of course rents, too, is another.

9426. Rents for land?—Rents for agricultural land which were made say three years ago.

9427. Does that include Government revenue demand then?—No, because that being based upon settlements made at long intervals, these comparatively short periods of fluctuation with which we are dealing now have only to a slight extent affected the revenue. Of course, I am speaking of the fluctuations since 1920. In any settlements which were made at the period of very high prices following the war no doubt the high prices have influenced the Government revenue; but that is a different question from this point as between 1s. 4d. and 1s. 6d. which we are discussing just now.

9428. Would you look upon adjustment of railway freights also as necessary? Freight rates on goods carried both ways for export and import?—There are so many other factors that enter into the question of railway rates that this is just one of the considerations. Railway costs of course depend upon the price of fuel, that is, coal, and wages rates, very largely. In so far as those do not readjust themselves, then of course the railway rates could not be reduced; but I think that coal prices have and would readjust themselves; they are sensitive on the whole to exchanges; wages are not sensitive.

9429. Without the railway freight being adjusted? —No.

9430. Let me make myself more clear, if I may. It has been pointed out that when an article for export is sent out, there is a reduction, owing to the higher rate of exchange, in the rupees that the cultivator gets?—True.

9431. The total cost of export, the f.o.b. cost if I may call it, of any commodity includes the cost of purchase at the village centre, *plus* the railway freight?—Yes.

9432. If the railway freight keeps steady and does not undergo the necessary reduction of $12\frac{1}{2}$ per cent. that falls on the cultivator?—It does.

9433. Would you agree that that would be a bad maladjustment as far as the price available to the grower is concerned?—Yes; so far as the percentage of the price which it forms it would be. But it would only work out between 3 and 4 per cent. of the price.

9434. That depends upon what percentage the railway freight forms part of the whole f.o.b. cost of an article?—Yes.

9435. Do you think there are many chances of wages in India coming down?—You mean if exchange remains stable?

9436. Irrespective of the rate of exchange, have you heard of any case where the cost of wages has gone down or where it has been possible to put down wages? Once you put labourers on a certain scale, has it been possible in your experience to reduce those wages?—Well, I am not in a position actually to give you specific examples. It would require a distinct and special inquiry to do that.

9437. I was only asking whether you in your course of study of the Indian currency problems and the general economic problems of India, had heard of any case where wages had successfully been put down?—My impression is that the wages of agricultural labourers have fallen in many parts of the country, certainly within the last five years.

9438. A Government report that I have seen says that wages have in fact been rising, and reports from district officers show that the tendency has been for agricultural wages to rise; but perhaps you have one province in mind and I have another? —As I say I do not profess to be able to pronounce a specific opinion; it is a matter of collecting statistics and I have not set out to do that.

9439. Would you look upon any sort of reluctance on the part of wages to decline as a very important part of the maladjustment which it is necessary to rectify before fixing upon a rate of exchange, or would you overlook it?—I think it is a highly promising feature as regards Indian life: the fact that working people can show resistance to forces tending to reduce wages is one of the most hopeful signs that we have ever had in India.

9440. But what importance would you give it in deciding upon the rate of exchange to be fixed?—I should give it comparatively little importance, the reason being that it bears heavily upon the undertaker or entrepeneur, the factory or millowner, the employer whoever he may be; therefore it gives an impulse to him to substitute improved machinery to improve his methods of production. Unless you apply that pressure to employers in any country they are slow about improving their methods; and a fall of prices is generally regarded hy most economists as being a period during which improvements are made in methods of production, because employers find they cannot carry on without reducing their costs, and when they cannot reduce wages they begin to turn and consider what other ways there are of reducing costs.

9441. You would not give it any great importance, and you would leave the industries and the grower concerned to try to economise their costs of production?—Certainly. To put it briefly this way, it must result in such an increase of the efficiency of the industry after a period of years that the workman himself has so much greater output of wealth per person to correspond with your reduction of prices due to higher exchange.

9442. I see. Although you would call complete adjustment of wages to the appreciation of the rupee the real standard by which to stabilise your exchange, you certainly would not give the malad-

justment any great importance?—No, I do not think so.

9443. What happens to the industry in the meantime? I suppose the industry goes on?—The industry feels very sorry for itself.

9444. And gets a set-back?—Yes, a temporary set-back; but it gets also a great stimulus and incentive to improve itself.

9445. It is not a stimulus that you really seek?—It is the stimulus by which a great deal of progress has been made in the last one hundred years, undoubtedly.

9446. People have actually sought that stimulus in order that an industry may look out for more efficiency?—People have not sought it; but we know that the great period of falling prices in Europe, from, say, 1873 onwards to 1896, was a period when manufacturers had the greatest difficulty in carrying on, and all the inventions adopted were in the direction of reducing cost. It was a great period for introducing labour-saving machinery.

9447. Where you cannot avoid it, I mean, you would rather tolerate it; you would not seek that stimulus?—I would not exactly seek it; but I do not think it is anything that we should take any special measures to avoid, if I may put it that way.

9448. You would not even do that when you knew that an industry had to face foreign competition which was taking advantage of it, or rather over it?—When you come to that question, of course, it raises the big issues of Protection. It appears to me that if we take the Indian cotton mill industry as an example, at present we are suffering from a dumping, as it has generally been called, of cheap goods from abroad, largely from Japan; and the measures which most countries have taken for the same purpose are either temporary or permanent increases of their Customs duties. To consider that question as affecting the rate of exchange, that is to say, the system of currency which you are going to establish, appears to me to be going outside the considerations which should be taken into account.

9449. Any witness who urged any arguments based on that must be considered to be urging something which was not relevant to the question under reference to the Commission?—Exactly; for which they had better seek some other remedy.

9450. Even though it may be admitted to a certain point that the appreciation of the rupee does put the industry to a disadvantage?—It does entirely, temporarily.

9451. Would you still say that those considerations are irrelevant to our inquiry?—Yes.

9452. Professor, in your paragraph 12 you have this: "To raise exchange to 2s. would have a very depressing effect upon industries and agriculture; and the lowering of the general price level which would result must operate quite unfairly on debtors and tenants." You yourself include that as a relevant subject, do you not?—Unquestionably.

9453. Therefore any other witness who may be raising that point could not be said to be raising anything irrelevant to that inquiry?—When I said irrelevant, I was speaking of the foreign competition in Indian markets. However, if I may explain what is meant by this statement here, it is that any rise of exchange will tend to have the effects here stated: that is to say, to lower the price level in India, therefore to be a disadvantage to tenants as against their landlords; and to debtors as against creditors, and so on. If you raise the exchange to 2s. naturally the effects will be much greater than if you raise the exchange to 1s. 8d. And if you keep exchange at 1s. 6d., as it is now, then these effects will not come into force; and if you lower the exchange to 1s. 4d. the effects will be reversed and you will tend to raise the price of produce and tend to favour the debtors as against creditors and tenants as against landlords.

9454. Any rise or fall does make a difference to exports and imports?—Undoubtedly, it must make a difference.

9455. That is the conclusion from this. In this case you say the adjustment has partially been complete?—It has nearly been complete, I think.

9456. Now in paragraph 12 you mention only one reason why the rate of 1s. 6d. is more satisfactory than the reversion to 1s. 4d. and that is because of the rise in the price of silver?—Yes, that is the main reason. I do not know whether you would remember the evidence I gave before the Committee of 1919. In common with other witnesses I laid special emphasis upon the need of protecting the currency system from a rise in the price of silver, pointing out how the currency systems of England, France, Germany, and the United States had been put upon the gold standard at a time when the price of silver was still high, still round about 57 pence per ounce, and that consequently they had a high ratio, and that India in common with some other countries like Japan had attempted to get upon the gold standard, or at any rate upon the gold exchange standard, when the price of silver had already fallen considerably, and was therefore at a disadvantage in comparison with the countries that I have previously named.

9457. But those considerations do not apply to-day, do they? I mean the 1919 considerations were based on the higher price of silver?—Well, we cannot assume that the price of silver is necessarily going to remain round about 33 pence.

9458. What is your opinion about the future of the silver market?—Well, I cannot make any estimate of the future at all, but I do think there is quite a possibility of the industrial demand for silver growing considerably so as to establish a generally higher level of prices, round about 42 or 45 pence per ounce perhaps.

9459. One view put before the Commission has been that as India is not likely to be a buyer of silver for coinage of rupees, it is possible that the silver market may remain fairly quiet for the next five or seven years?—Oh, yes, I quite agree with that. But I am lookng further ahead. I take it that any system of currency now established is intended to be permanent; just as the English system established in 1816 still exists, with modifications made since the War. It was in operation practically for 100 years without change. So we may hope that the system to be shortly established in India will last a hundred years or more.

9460. With 90 crores of rupees in the Government treasury and with the gold coin which you suggest should be put into circulation, do you really think that after five or seven years India would require very large quantities of silver?—No, I do not say large quantities, but I certainly think that India might be requiring silver again after that time.

9461. For the coinage of rupees?—To some extent for the coining of rupees; and the ordinary industrial demands for silver will continue, of course.

9462. I see. You still think that, in spite of the gold coinage that you recommend, the consideration of the silver prices must be borne in mind in fixing a ratio?—Oh, certainly.

9463. You would not agree with those who think that this ought to be looked upon as a subsidiary consideration or secondary consideration?—No.

9464. At the end of paragraph 12 you mention that a valuation of 1s. 6d. would not make a round number of rupees and therefore you go on to consider the question of raising the exchange rate to 1s. 8d. in order to get an even number of rupees?—Yes.

9465. And you say this:—"By waiting for a general rise of prices throughout the world, a rise of exchange to 1s. 8d. could be effected without lowering prices in India." It may be without lowering prices in India, but it certainly would mean by depriving the Indian grower of the rise that those in other parts of the world get?—Certainly.

9466. Do you think that is a policy that should be followed by Government, except under very extreme circumstances?—Well, it is a question of opinion.

9467. I am asking your opinion. If you will give me the benefit of your opinion about it?—I do not think I should do it. Otherwise I should have recommended the rate of 1s. 8d.

9468. I just wanted to ask whether you think that should be done?—No, I do not recommend it. But I can conceive that the majority might be in favour of it.

9469. And you particularly would not recommend it because in case a fall in world prices should follow, you would not recommend lowering the ratio. It should only be done once and one way only?—It should be done only once and one way only, and only to a figure which Government can be sure of maintaining. But I think that Government could be practically certain of maintaining 1s. 8d. with the resources which it has. Of course, I am not saying that I advocate it, but I say the resources are such that Government could be practically certain of maintaining the 1s. 8d. rate—if it were adopted in the period of rising prices that I propose.

9470. But you made a very important condition there. In your paragraph 14 you say: "If the banks should not, in fact, work harmoniously with Government it might prove difficult to mantain exchange"?—Yes, that is an important condition.

9471. And in your book, Professor, you say not only the exchange banks but also the Indian bankers should be asked to work in co-operation with Government for this purpose. And you further say that the banks which the Government consult should not be greedy and should be satisfied with a certain advantage only?—Quite true.

9472. So, there are so many conditions which you lay down in this connection that, knowing human nature as we do, it may perhaps be very difficult of attainment?—No, I do not think so, if the need of it is understood. You see, there has been a great change in the banking system in England during the last 40 years or so, and during the last 15 years or so in America. In America, the banks as a whole are organised at any rate, if not specifically united, with the Federal Reserve system; yet, as in England, they have the practice of working together, consulting together, and meeting a situation which requires deflation by common action.

9473. Do you think that is feasible in India?—Not at the present moment, until bankers have discussed this problem amongst themselves.

9474. Do you think there is a beginning made among those even after the two or three crises we have passed through?—I do not think it is difficult to begin the education.

9475. Has it not been your experience that each one pulls his own way under these crises?—So far. But it need not continue so indefinitely.

9476. Now, in paragraph 23 you have this:—"I have recommended above that a rupee defined in gold should be the standard coin of India." May I ask whether till 1914 the rupee defined in gold was not the standard coin of India?—Oh, yes, it was.

9477. But, owing to expediency, the Government changed it from that into a subsidiary coin?—On the outbreak of war, you mean.

9478. Or after, a little later?—According to the most generally used definition of a standard coin we can certainly say that the sovereign was the standard coin of India in the period immediately preceding the War.

9479. But immediately Government ceased to issue it. I put that question in order to lead on to the next one. My point is that before the War or till the outbreak of War, a rupee was a $\frac{1}{15}$th part of a gold sovereign. Why do you, Professor, recommend a change in the ratio?—Well, for the protection of the currency system against a rise in the price of silver.

9480. Only for that and nothing else?—That is the main reason. The secondary reason is the disturbance to trade, and the adjustments which would be required to go back from the 1s. 6d. to the 1s. 4d. level.

9481. Now, the first one we understand clearly and we have discussed it. Regarding the second, you are not able to tell us which adjustments you think are complete and which are incomplete? I have mentioned to you the incomplete part of the adjustments as they have been put before the Commission. Can you tell us the complete part of the adjustments, if you remember those?—Well, the adjustments most likely to be complete are the prices of the staple commodities in the markets, and the wages of unskilled labour.

9482. You thnk they have been adjusted—wages of unskilled labour?—I say they are the most likely to have been adjusted. I am not acquainted with the actual facts.

9483. You are only naming these?—We know that in other periods of declining prices or rising exchanges, the rate of wages that have been adjusted have followed most closely the cost of living. That was the universal experience throughout the latter part of the 19th century in Europe.

9484. These are the two most important points you can think of?—Yes.

9485. Now, it has been suggested, Professor, that, since the Fawcett Committee reported (the difference then was between 1s. 3d. and 1s. 4d.), Government had to deflate in one manner for a period of very nearly six years. They did not coin rupees even on their own account and they therefore abstained from supplying the currency necessary for the (annual and) increasing requirements of the country. There also coincided with that period two of the biggest famines that we have known in India. It was owing to these reasons that the rupee finally became stabilised at 1s. 4d. and the adjustments took place. The famine acted very usefully for the adjustment of wages. It has therefore been suggested that, if 1s. 6d. is stabilised, a long and hard struggle may be involved as far as capital and labour is concerned. Have you any views about this?—Well, one can only speak of tendencies in these cases. The tendency is, of course, for the struggle to be more severe if we leave exchange at 1s. 6d. than if exchange were to be reduced to 1s. 4d. In fact, if exchange were to be reduced to 1s. 4d. the probability is that there would be no considerahle tendency for reduction of wages now.

9486. No demand for reduction of wages?—Yes. Probably there would be no strong demand on the part of employers to reduce wages, because they would find that prices had risen—in the majority of industries, I do not say all. The majority of industries would find it easier to go on paying the wages which prevail than they do now. But if I might be allowed to offer an observation, if such a consideration is to be taken into account, that is to say the advantage to the industrial situation within the next two or three years in an alteration of the exchange rate from 1s. 6d. to 1s. 4d., we are setting out upon a policy of stabilisation of prices and of an unstable exchange; and after a few years the reverse effects might come into play.

9487. Why do you say "unstable exchange"?—I mean, allowing the price situation in India to influence your judgment on the question of exchange; and once you do that, you are setting out on the alternative, for a policy of stabilisation of prices rather than stabilisation of exchange. The two policies must be kept clearly distinct.

9488. You mean you would only look at the stabilisation of the prices for the purpose of stabilisation of exchange?—You must make up your mind whether you are going in for a policy of stabilisation of exchange or stabilisation of prices. If, therefore, in considering about what exchange rate is to be established, you take into question the existing price level and the difficulties which in-

dustries find in paying the existing wages on account of the low price level, you are setting out to determine exchange on the basis of the "stabilisation of prices" principle rather than on the "stabilisation of exchange" principle. It just so happens that in the present trade and industrial situation we are at a point where it might be very advantageous to lower the rate of exchange and brighten up industry. Three or four years hence, with a considerable world demand for India's raw materials, and a highly favourable balance of trade, you might have the reverse effect of an outcry for exchange to rise, to prevent prices rising any higher, as the cost of living would be going up in India.

9489. Would that not adjust itself, I mean, the question arises at present for once, and that is more for the purpose of conversion of the rupee into your gold currency?—What I am trying to point out is that in taking such an argument into consideration you are allowing temporary conditions in trade and industry to influence your decision as to your permanent policy.

9490. Which you would not approve of?—I think the two must be kept separate.

9491. I was looking at the evidence you gave before the Babington-Smith Committee, Professor Jevons, and I see that you supplied them with a memorandum containing your considered views on the question of fixing the permanent rate of exchange, and you there attached very great importance to the rate, or any rate to be fixed, being liable to be maintained?—Yes, I did.

9492. Do you think that the same importance should be attached in fixing the rate of exchange now, or would you attach any less importance now than you did in 1919?—I attach equal importance now to the necessity of seeing that the resources are adequate to maintain the rate of exchange fixed.

9493. You have told us earlier that you think that at 1s. 6d. our resources are ample?—Yes. It is not a question at present of difficulty of maintaining exchange but of keeping it from rising.

9494. That would happen with any rate of exchange, would it not, if Government have a dead inoperative ratio on the statute which prevents gold from being tendered to Government at all?—The present situation is unsatisfactory, of course.

9495. Therefore it is contended there is nothing special that Government have done in preventing the ratio rising from 1s. 6d. Gold, which is a very necessary natural thing for the expansion of currency, cannot be tendered to Government at all? The whole question is whether with 1s. 6d. and with the liability of India to adverse balances of trade or to famines, you think the 1s. 6d. runs the risk of being disturbed?—I do not, personally.

9496. *Sir Maneckji Dadabhoy:* In paragraph 2 you make a very wise recommendation about the Legislature being consulted as regards the ultimate proposals. But will you please tell the Commission how you will guard against speculation and financial disturbance between the period of the report and the ultimate adoption of the proposals?—Well, it is impossible altogether to avoid such speculation; but if the period for adoption is not fixed, but left to Government to notify suddenly, then the uncertainties will not be of the kind to encourage speculation.

9497. Even if the period of adoption is notified by Government, still it would be some future date and some measure of speculation would be indulged in?—It need not be some future date, as was done in 1920. Government brought the alteration into effect immediately they made the notification, and that is still practicable, although the notification, is made in respect of a principle which has been determined on any time previously.

9498. Then in your opinion, on the whole, the advantage of consulting the Legislature would be greater than the disadvantage of financial dislocation?—Yes, I think so, on the whole.

9499. In paragraph 8, where you speak of the risk of a falling exchange, you maintain that the fall of exchange is quite sufficient to deter English investors from purchasing rupee securities otherwise sound and attractive. Now will you please tell the Commission that when the ratio remained steady for a period of 20 years at 1s. 4d., did it deter English investors from investing money in India and generally in Indian securities—the fact that it remained stationary encouraged English investors, when it was at 1s. 4d.?—The belief that it was likely to remain at 1s. 4d. undoubtedly was an encouragement to English capital to come out to India.

9500. But at that time the belief that it was going to remain steady for such a long period was not existent at the commencement?—I venture to differ there. The law had already been passed that gold was to be to the rupee at 1s. 4d. The sovereign was to be accepted, and that meant that exchange could not rise higher, and after 1900, when the gold standard reserve was established, there was a practical certainty that exchange would not fall.

9501. So it induced further investment in the country?—I think so, especially after 1900.

9502. Take the reverse case now. You said that this high exchange has continued now for a period of nearly 16 months, at 1s. 6d.; has it brought any money from England during this period?—No, not much I should say.

9503. Any at all?—I cannot say. The point is that people would not be inclined to invest their money in rupees in India much for the reason that, for all they know in England, the rupee might go down to 1s. 4d. next year.

9504. In reply to the Chairman, as well as in answer to Sir Purshotamdas Thakurdas, you stated there has been a substantial adjustment in India to the 18d. rate?—Yes.

9505. When did this substantial adjustment commence; how many months ago?—Well these adjustments must take place practically *pari passu* with the change of exchange in regard to the prices of certain staple commodities; and in regard to all other things they take place side by side. Without an enormous investigation one could not say exactly at what dates the adjustments came about.

9506. Is it not very material in order to correctly find out if the adjustment had actually taken place to see when it really started?—I think economists would be very pleased if the Commission would undertake that investigation. They would require a sufficient staff, to do that, and I am certainly not able to say.

9507. And the adjustment is not complete even to-day?—On theoretical grounds I should say it is not yet complete.

9508. And one cannot state when the adjustment would be quite complete?—In a sense these adjustments never become complete because before they become complete something else causes a disturbance.

9509. Supposing a famine starts next year, all these arguments will be of no use?—The causes influencing prices are so varied that questions of exchange are only one of them.

9510. If we have a famine next year or a couple of years after, all these calculations are upset?—Well, I would not say that a famine next year or the year after would upset the exchange if it be stabilised at 1s. 6d. I think our resources are quite sufficient to maintain it, even in the face of a year's famine. But if we had a series of famines so severe as those of the 'nineties, there might be a temporary difficulty. The only resource that the Government of India would then have, after it had exhausted its sterling resources, would be to raise loans in London; it could raise £10 millions in London in a moment, and so there would be no difficulty in tiding over a period of adverse balance.

9511. In paragraph 12, among three or four reasons you have given for maintaining the 1s. 6d. rate, you have stated about the protection to the currency system against the rise in the price of

silver. Sir Purshotamdas Thakurdas has asked you already a question or two about it. Now in this protection which you now speak of, there is the margin of safety?—Yes.

9512-3. So it is a mere question of grade? You want a gradual protection. If you first make it 1s. 8d., a further protection at 2s. After all it is a question of graduation?—Yes.

9514. Now taking all the circumstances into consideration, the present price of silver being 31d. and the silver at 43d. per ounce, is not the margin between 31 and 43 a sufficient margin?—I should prefer to see the margin greater.

9515. As a matter of over-caution?—Yes, as a matter of caution.

9516. On no other grounds but as a matter of over-caution?—As a necessary caution, in my opinion.

9517. The price of silver during the War went up to such a high pitch. Generally if you look to the past history of the value of silver, it has not shown so much variation. It was the extraordinary circumstance of the War that raised the price of silver?—Up till 1870 the price of silver always remained somewhere near 60d. per oz. Then came the long fall in the price of silver which has involved India in difficulties; and since the beginning of this century we have seen on the whole a tendency to rise, which became enormously accentuated during the War.

9518. And then, after the War, it has gone considerably down?—Certainly, but not to the pre-war level. Its ratio to gold is higher now than it was in pre-war times.

9519. So, do you not think that as England has now restored the gold standard and all other countries have resorted to it, if you introduced gold standard into India, it is very unlikely that the price of silver will vary, because there will not be large demand for silver in the country except for jewel purposes, for use by Indian women?—I admit that the Indian demand is less, but I have already mentioned that I think there is quite a possibility of the industrial demand for silver in the world in general expanding very considerably within the next 20 years, in the vast increase of industrial uses of photography in which although much silver is recovered yet involves a certain amount of waste.

9520. So in your opinion, for industrial purposes silver will be largely in demand in the next 20 years?—Yes, in my opinion.

9521. And therefore we should adopt the over-caution of keeping the ratio at 1s. 6d.?—Yes.

9522. Do you want this to be a provisional ratio or a permanent ratio, because throughout your examination you were very sceptical so far as the maintainability of the ratio is concerned. You stated that it would be easier to maintain a ratio at 1s. 6d. than at 1s. 4d.?—No, no; it is necessarily easier to maintain a ratio at 1s. 4d. than at 1s. 6d.

9523. It is easier to maintain 1s. 4d. than 1s. 6d.?—Yes. I consider there is adequate reserve to maintain it at 1s. 6d. and possibly adequate to maintain it at 1s. 8d.

9524. You stated that when we adopt a gold standard, gold in demand would not be very much if we avoid inviting the public generally to exchange silver for gold?—Yes.

9525. Will it be fair to the country that when we adopt a gold standard we should withhold from them any such information? That is, that the Government and the banks will exchange notes and silver for gold?—It all depends on whether the limitation of legal tender is imposed; and I have said that it is desirable not to put any such limit on the amount of rupees which should be legal tender.

9526. So your system is that in course of time we should introduce gold standard gradually?—Yes.

9527. Meanwhile the rupee should continue to remain unlimited legal tender?—Yes.

9528. And the silver currency should side by side subsist with the gold standard?—Certainly.

9529. Will not the existence of the silver currency, I mean keeping the silver rupee as unlimited legal tender, affect or interfere with the success of the gold standard?—It depends on what you mean by "success of the gold standard."

9530. Making it quite a success?—What I regard as a successful gold standard is that you could maintain a gold exchange, a stable gold exchange, and allow the people to have such gold as they want in circulation. If they use gold, then, of course, the rupees would become redundant. But if they prefer using rupees, then a small amount of gold will be in circulation; but the system will be successful.

9531. As regards paragraph 17, where you advise not to transfer to the Imperial Bank for a further period of 10 years the right of issue of notes, I understand that you will have no objection to the transfer of the note issue to the Imperial Bank provided they merely act as Agents for the Government?—I certainly think there will be no strong objection to that, provided the Bank is fully willing to undertake the responsibility.

9532. That goes without saying; it is on that assumption, of course.—Yes.

9533. And as the Chairman said, or drew your attention to the fact, that if the whole department, the present existing department, will be bodily transferred and placed under the charge of the Imperial Bank, there could be not much difficulty.—Yes.

9534. *Chairman:* Have you given any consideration to the question of the ideal constitution of a Central Bank for India? It is not included in your memorandum and I thought perhaps it might have escaped your attention?—No; I am quite satisfied with the Imperial Bank as at present constituted.

9535. There are no substantial fundamental changes in principle as regards the constitution of the Imperial Bank which you desire to suggest?—No; not apart from the question of note issue which we have already discussed.

9536. The separation of the issue department from the banking department?—Yes.

9537. *Chairman:* The Commission is very much obliged to you for your memorandum and for your assistance here to-day.

(*The witness withdrew.*)

TWENTY-FIFTH DAY.

Tuesday, January 5th, 1926.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman.*)

Sir Rajendranath Mookerjee, K.C.I.E., K.C.V.O.
Sir Norcot Hastings Yeeles Warren, K.C.I.E.
Sir Reginald Mant, K.C.I.E., C.S.I.
Sir Maneckji Byramji Dadabhoy, K.C.I.E.
Sir Alexander Robertson Murray, C.B.E.
Sir Purshotamdas Thakurdas, C.I.E., M.B.E., M.L.A.
Professor Jahangir Cooverjee Coyajee.
Mr. William Edward Preston.

Mr. G. H. Baxter.
Mr. A. Ayangar. (*Secretaries.*)

Mr. Norman Murray, called and examined.

5938. (*Chairman.*) Mr. Murray, you are one of the Managing Governors of the Imperial Bank of India?—Joint Managing Governor of the Imperial Bank of India.

9539. In order that we may have it on our record, how long have you occupied that position?—I was confirmed in the position a year ago, but I have acted in it on two previous occasions.

9540. Has your experience of banking been in the Imperial Bank of India?—Originally in the Bank of Madras which was one of the Presidency Banks. There were three Presidency Banks from which the Imperial Bank of India was formed.

9541. You have been in the Imperial Bank of India since its formation?—Yes, Sir.

9542. And that is an experience lasting over how many years?—Close on 30 years in the East.

9543. We understand that in coming here to-day you come to give evidence based on your experience of business in the Imperial Bank of India, but given in your personal capacity?—I should like it on record that I am here entirely in my personal capacity.

9544. Your replies will not be given, as it were, on behalf of the bank?—No, they do not commit the bank in any way.

9545. For the information of those of us who are not so familiar with these matters, would you tell us in general what is the nature of the business transacted by the bank at present at its chief offices and branches?—I would like to classify our business under three main heads. We do a general banking business; we are the Government bankers; and we are tho bankers' bank.

9546. What would be the chief activities of the bank as regards its general banking business?—We collect deposits in the form of current accounts, fixed deposits and savings bank deposits. We grant advances in the form of loans, cash credits and overdrafts and discounts and we make transfers on behalf of our constituents.

9547. Is there any minimum limit on the amount of your current accounts?—No, we have no fixed limit on the amount of our current accounts. We have a fixed limit on our fixed deposits—Rs. 500, and in the savings bank our minimum is Rs. 5.

9548. As regards this general banking business, are you subject to any restrictions by Statute or otherwise?—We are subject to restrictions* under the Imperial Bank of India Act. The main restrictions are that we are prohibited from granting advances for a longer period than six months; we are prohibited from dealing in foreign exchanges; we are prohibited from granting advances on immoveable property, and we are prohibited from granting unsecured advances in excess of the amount laid down by the bye-laws at present, *i.e.*, 1 lakh. These are the main restrictions.

9549. Could you amplify that a little by telling us which of these constitutes a real practical limitation upon what would be the ordinary current business of an unrestricted bank and to what extent it imposes a real practical limitation of such business?—To begin with, the restriction on exchange business debars us from what is a very profitable business. Outside that the restrictions do not put us to any very great disability.

9550. Except as to this limitation on foreign exchange business, may I put it in this way, that the other restrictions might be imposed upon any other bank without seriously impairing its profit-earning capacity?—I think so, yes.

9551. Is this limitation on foreign business absolute?—We are permitted to make remittances for the *bonâ fide* requirements of our own constituonts for their personal requirements but we do not engage in trading transactions.

9552. Does the amount of business that you are permitted to do there come to any substantial volume of business?—We have made out a statement*; I have not got it before me, but I think it shows that the turnover is 6 millions. I think you have the statement, Sir.

9553. You have had a statement prepared?—Yes.

9554. Perhaps you would be so good as to put that in, Mr. Murray; I have not got it?—We sold 6 millions, against which we bought 4 millions from the exchange banks.

9555. That is all that this statement to which you refer shows, that you sold 6 millions transfers to your private customers and you bought 4 millions of that from the exchange banks?—Yes, Sir.

9556. You have specified among your general banking business the transfer of funds. That is inland transfers?—Inland transfers from one branch to another.

9557. Is that a novel system recently established in India?—No, we have done it for many years.

9558. That is the Presidency Banks?—Yes.

9559. Recently has it had a big extension?—Yes, it has had a big extension because Government has given us a concession of free transfers from one branch at which there is a district treasury to any other branch at which there is a district treasury.

9560. Will you enlighten my own ignorance by telling us whether that is a profitable business, or an onerous business?—There is not very much profit in it from our point of view. It is a concession that is very useful to our constituents.

9561. I think you have not given us yet any analysis of the business which you conduct for the Government?—We keep the Government account at our local head offices and at our branches also. We conduct the treasury work at our branches† and we conduct the Public Debt Office.

* *See* Statement No. 1, printed at end of Mr. Murray's oral evidence.

* *See* Statement No. 4, printed at end of Mr. Murray's oral vidence.

† *See* Statement No. 11, printed at end of Mr. Murray's oral vidence.

9562. Will you amplify a little what the Treasury business is?—We receive all collections from the general public for credit to Government account and we make payments to the public and also we place funds at the disposal of Government whenever they may require them. We treat that account as a whole.

9563. The Government has only one deposit account with the Imperial Bank of India?—The Government has one deposit account.

9564. There are no compartments?—There are no compartments.

9565. That is a result of the formation of the Imperial Bank of India?—It is the result of the formation of the Imperial Bank of India.

9566. Resulting in an economy, no doubt, to Government balances?—Yes, an economy to balances generally.

9567. What is the business comprised in the management of the Public Debt Office?—That includes the calculation and payment of interest on Government promissory notes.*

9568. What are those?—They are the securities issued by Government or by the Public Debt Office on behalf of Government when they issue loans—Government paper.

9569. Rupee paper?—Yes; we undertake the consolidation, sub-division, cancellation and renewal and enfacement of these securities, and we provide the machinery for the flotation of new loans.

9570. I am not acquainted with the course of business in the issue of a rupee loan. Is that loan made by and through the Imperial Bank, as a British Government loan is made by and through the Bank of England?—The loan is issued by Government, and what generally happens, as far as the bank is concerned, is that we take up a big block of it to begin with. It is not sold entirely by us; it is issued at the treasuries as well as through us; but we take up a big block when the flotation of the loan is made, and we sell it over the counter to the public.

9571. If I am applying for a part of a new rupee loan, to whom do I apply; to you?—You could either apply to the treasury or to us.

9572. You say finally that the Imperial Bank is a bankers' bank; would you expand that and tell us what the meaning of that phrase is?—Most of the leading banks in India keep their accounts with us† and we also conduct the clearing houses at places where there are clearing houses.‡

9573. You tell us that most of the leading banks keep an account with you, but apparently not without exception?—There are probably some small banks in the districts which do not. In all the bigger towns, all the banks of any standing do keep accounts with us.

9574. Finally, you say that you manage the clearing house; that is, the actual working of the clearing house is conducted by the officials of the bank?—It is conducted in our offices, where the representatives of the other banks meet under the supervision of an officer of the bank.

9575. And you provide the necessary staff?—We provide the staff.

9576. What is the distribution of the clearing houses? How many are there in India?—There are 11 in India.

9577. We may take it that those are in the principal cities?—Yes, all the principal cities; I have a list of them here.

9578. Are all the clearing houses organised upon the same model?—Yes, they all are.

9579. How does a bank become a member of the clearing house?—By consent of the members already existing.

* See Statement No. 2, printed at end of Mr. Murray's oral evidence.

† See Statement No. 13, printed at end of Mr. Murray's oral evidence.

‡ See Statement No. 10, printed at end of Mr. Murray's oral evidence.

9580. Does the Imperial Bank exercise any authority in deciding who is to be a member of the clearing house?—Not more than any of the other banks.

9581. Such being the nature of the business transacted by the Imperial Bank, will you tell us to what extent and in what particular branches of its business does the bank come into competition with other banking organisations in India?—There are a good many of our branches (I think there are 75) at which we have no competition at all with any other bank.

9582. Because there is no other bank there?—Yes. At the other branches we do come into competition with the other banks in general banking business; including the cities, we come into competition at about 100 of our branches.

9583. And that competition is subject to whatever rules you may have?—Subject to the restrictions which are placed on us under the Act.

9584. As to which you tell us the one that is practically effective is the restriction on foreign exchange business?—Yes, that is the most important of them; of course, there are other restrictions under which we cannot grant advances on more than one name or on the security of shares; that is an important restriction I forgot to mention.

9585. That is the restriction that you cannot grant advances on the security of one name only?—One name only.

9586. Or on the security of shares?—Yes.

9587. Will you explain how this limitation as to not granting advances on the security of one name only becomes a practical restriction in Indian business?—It is quite possible that a customer of good standing might wish to borrow either on his own name or on the security of shares and in such a case we would have to let the business pass us.

9588. Do other banks do much business on this basis?—I should think other banks must do a certain amount of business on shares.

9589. And on a single name?—I could not say.

9590. It is not a marked feature of Indian banking business?—I think not.

9591. There are some figures and statistics that I thought you might perhaps usefully be able to give us; first of all, a statement of the assets and liabilities of the bank outside India?—I have two statements here;* one is the statement of the affairs of the London Office of the Bank; the other is the statement of the affairs of our Colombo office.

9592. By putting these together we can arrive at a general total of the non-Indian assets and liabilities located outside India?—Our assets and liabilities in London, you will see from that statement, practically balance each other.

9593. The statement as to the affairs of the London Office as on the 18th September, 1925, shows a balance between liabilities and assets at 1·77 crores?—No; £173,000; that is equal to Rs. 20,59,000. I have the sterling figures on one side there and the rupee figures on the other.

9594. I see; these are double columns, sterling and then rupees. What is the total of your London assets?—Shall I give it to you in pounds or in rupees?

9595. In both?—About £ one million and ten thousand.

9596. That shows a practical equality between assets and liabilities?—Yes.

9597. What is the total of the assets in Colombo?—In Colombo our liabilities very largely exceed our assets. They are mostly on current account and fixed deposit; they exceed our assets by over two crores.

9598. The assets being how much, just to get the order of the amount?—Our assets are 147 lakhs and the liabilities are 348 lakhs.

9599. The second statistical question is as to the average maturity of domestic bills held by the bank?—The maximum maturity is 90; the average would be about 60 days.

* Nos. 5 and 6, printed at end of Mr. Murray's oral evidence.

9600. Next, the average maturity of overdrafts granted by the bank; is it possible to give any figure?—It is very difficult to give a figure for overdrafts and cash credits because they are all running on demand and liable to be called up at any time.

9601. And the actual period for which they run, I suppose, varies with the nature of the business?—It varies considerably according to the nature of the business.

9602. Is it possible to give any approximate figure for the average duration?—I think it will be quite impossible, Sir.

9603. Next I wanted to ask you for some particulars about the securities held by the Bank, and I am going to ask you to divide them into four heads, (*a*) Government of India, giving the date of maturity; (*b*) Other Governments, giving the date of maturity; (*c*) Provincial or local Governments, and (*d*) Other Securities?—I have a statement here* showing—

	Rs.
Government of India securities ...	1,627 lakhs.
Provincial Governments	82 ,,
Municipalities	49 ,,
Port Trusts	90 ,,
Improvement Trusts	35,000 ,,

Miscellaneous (that is, State-aided and District Board Railways)—Rs. 15,24,000; that makes a total of about Rs. 18,65,00,000.

9604. That shows that the proportion of Government of India securities to the total is approximately as 8 to 9?—Yes.

9605. The next heading of inquiry is the turnover of the sterling exchange dealings of the bank during the last financial year?—Those are the figures which you have been discussing.

9606. Have you a statement giving them in more detail?—No, it does not give it in detail. I will hand you the statement.†

9607. This shows an item of approximately 4½ millions of purchases from the exchange banks; the other item of importance is one million and a-half approximately on cheques, bills, &c.; purchased from your own customers?—Yes.

9608. Now I come to your London office. What is the character and extent of the business which is done by the London office?—We open current accounts and deposit accounts, receive fixed deposits but only from persons who have within the previous three years been customers of the bank in India, or of one of the Presidency banks, and we make advances in the form of overdrafts on current account.

9609. Is there any distinction between the deposit accounts and fixed deposits?—Fixed deposits are accounts which are fixed for given periods. In our case, it is always six or twelve months.

9610. Those are the fixed deposits. And deposit accounts, they are at notice?—Sir Norcot Warren will be able to tell you better.

9611. *Sir Norcot Warren*: We take deposits at seven days' notice.

9612. *Chairman*: Deposit accounts are at seven days' notice?

9613. *Sir Norcot Warren*: Some are at six months.

9614. *Chairman*: I understand that is the distinction between these two, the deposit accounts and the fixed deposits?—Yes.

9615. With regard to the people for whom you accept these accounts in London, must they have been customers in London?—They must have been customers in India before they became customers in London.

9616. Had the Presidency Banks any branch in London?—No, the Presidency banks had no branch in London. Each bank had its own correspondent in London.

* No. 3, printed at end of Mr. Murray's oral evidence.
† No. 4, printed at end of Mr. Murray's oral evidence.

9617. So the persons from whom you accept deposit accounts in London must have been customers of the Imperial Bank or of the Presidency Banks at any office in India or Ceylon?—Yes.

9618. That is the first category. What is the next?—Then loans are granted against securities deposited with the banks in India. Funds are borrowed when necessary from London bankers and bills on India are collected for other banks and cheques and bills are purchased under credit opened by the banks head offices in this country. Drafts and T.T.s on India are sold principally to other banks for small amounts.

9619. How does that relate to this restriction on foreign exchange business?—It is only done to a very moderate extent and is a means of providing funds to meet our own constituents' requirements.

9620. This comes under the exception of business for the *bona fide* requirements of your own customers?—Yes.

9621. Are there any further headings of business?—I don't know that they are of importance. Securities are kept in safe custody only on behalf of our own constituents. The flotation of loans on behalf of public bodies in India is undertaken. Subscriptions are received for rupee loans issued by the Government of India, and subscriptions for Government of India sterling loans are dealt with on receipt of cabled advices from banks' head offices in India.

9622. That is consequential in regard to the business done in these loans in India?—Yes.

9623. You say the flotation of sterling loans?—Not for the Government of India but for public bodies in India. We have nothing to do with the flotation of sterling loans for the Government of India. That is undertaken by the Bank of England.

9624. You say that subscriptions for the Government of India sterling loans are dealt with. What do you mean by "dealt with"?—Well, that is just a matter of procedure. They are remitted from this country, from India, and paid at that end towards the loan.

9625. Subscriptions from India?—Yes.

9626. You tell us that the whole management of the sterling loans of the Government of India is in the hands of the Bank of England?—Yes.

9627. Has any suggestion ever been made that the Imperial Bank should deal with the business now transacted in this regard by the Bank of England?—I have heard it suggested, but I think there are difficulties in that.

9628. There are statutory difficulties?—Yes, statutory difficulties.

9629. Could you refer us to the statutes?—I could not.

9630. No doubt reference can be made to these. Apart from statutory difficulties, the question might arise whether there are any practical difficulties?—I think there are no practical difficulties. I think the trouble is entirely statutory. I could look up that matter and let you have further information.

9631. Further information being directed to the statutes or to the question of practical difficulties?—No, the statutes.

9632. We need not trouble you, I think, Mr. Murray. It is quite easy to identify them. Is there any further business transacted by the London office on behalf of the Government of India?—The London office manages the rupee debt in London, in the same way that they manage the rupee debt out here.

9633. Can holdings of the rupee debt be transferred in London?—They can be transferred from India to London.

9634. And from hand to hand in London?—Yes.

9635. The management includes the payment of interest?—Yes.

9636. What remuneration do you get for that work?—The remuneration for that is £300 per crore

of rupees. We took that over from the Bank of England. Its remuneration was greater than that.

9637. How much greater was the remuneration of the Bank of England?—£200 per crore greater. We also have the account of the High Commissioner for India in London.

9638. You are his bankers?—Yes.

9639. That is on an ordinary commercial footing?—Yes.

9640. Before we continue, I think it might be convenient at this point, Mr. Murray, if we were to complete the picture as regards the relations in the matter of remuneration and services between the Imperial Bank and the Government of India. We have just dealt with the remuneration received under one small heading, that is the management of the rupee debt in England. Could you, for convenience sake, give us a general account of any form of remuneration received by the Imperial Bank from the Government of India on the one side of the book, and, on the other side of the book, the services performed in addition, if any, to those of which you have already told us by the Imperial Bank for the Government of India. Does the Imperial Bank receive any other payments from the Government of India?—The only other payment we receive from the Government of India is payment for the management of the public debt office.

9641. On what basis is that payment?—The remuneration received there is Rs. 2,000 per crore per annum.

9642. What percentage is that?—That is $\frac{1}{50}$th per cent.

9643. There are no other payments by the Government of India?—There are no other payments by the Government of India to the Imperial Bank. The treasury work we conduct without payment. That entails a very considerable amount of work and a very considerable amount of expenditure, both capital and current. As compensation for that we have the Government balances on which we pay no interest.

9644. Are the statistics as to the Government balances held from time to time readily available in any convenient form?—I have a statement.* This statement shows the highest and lowest public deposits during each year since the amalgamation of the three banks. Also the highest and lowest bankers' balances and the highest and lowest bankers' borrowings.

9645. This is a statement in lakhs?—Yes.

9646. It shows that, in 1925, the highest figure for public deposits was 2,896 lakhs and the lowest figure 430 lakhs?—Those are the figures.

9647. You also provide us with a statement† giving the details, into which we have already entered, as to the management of the public debt of India by the Imperial Bank of India?—Yes.

9648. To complete the picture, is there any other matter which we ought to take into account in considering the services rendered by the bank for the Government and the remuneration received? Should we, for instance, take into consideration the opening of branches?—We have done a great service, I think, to the Government and to the country by the opening of our new branches.

9649. Are all those branches remunerative?—It is rather too early to judge these new branches. They are still in their infancy, but a certain number are already remunerative, several others are building up quite a healthy business and only a few show no prospect of ever being able to cover their overhead charges. There are 32 of these new branches working at a profit—56 of them are still working at a loss.‡

9650. But you have hopes that some of these 56 may build up remunerative business?—They have not had time yet to show results. Taking all these new branches together the credit balances of the current accounts amount to 3 crores and 10 lakhs, our savings bank balances are 1 crore 68 lakhs, and our fixed deposits 3 crores 57 lakhs. We have altogether collected over 8 crores of deposits.

9651. Can you give us the figure for advances by those branches?—Our total advances at these new branches are 3 crores and 46 lakhs.

9652. What would be the policy of the Bank in regard to the opening of further branches?—There is no doubt that the policy of the Bank will continue to be progressive, and wherever a demand arises for a new branch with reasonable prospects of business, I am sure the Bank will meet the demand. But the strain thrown on our staff in opening these 100 new branches in the past five years has been very heavy, and I think that for the present it would be wise to concentrate on consolidating the business of these new branches rather than on any rapid expansion. As far as further development goes, my own view is that we should concentrate more on developing business in and around the branches already opened than on looking for new branches. We could do that by means of outstations which would bring banking facilities into villages where there is not sufficient business to cover the overhead charges of a full branch. The main difficulty in that is the matter of training our staff, and I think we would be able to do that gradually.

9653. The outstations, as I understand it, are outstations of branches?—Yes, radiating from branches and managed by those branches.

9654. To be quite sure we have not omitted any consideration in this matter of the relations between the Government and the Bank, is there any other matter which suggests itself to you to be taken into account in considering the bargain, as it were, between the two?—In addition to these new branches I can think of nothing else.

9655. Let me put to you a supposition. If the Imperial Bank were to take over the paper currency and the control of the reserves, and were to be given the sole right of the note issue, with the obligation of maintaining exchange between certain gold points, would you anticipate any practical difficulty in the Bank providing the funds for meeting the sterling expenditure of Government?—Assuming these circumstances, the Bank's position would be practically the same as the position in which the Government are now and I do not foresee any practical difficulties.

9656. With regard to the seasonal expansion of currency, how have the arrangements recently introduced worked? Are there any suggestions to be made for improving them?—In practice, the arrangements have, I think, worked satisfactorily and have served their purpose. The main difficulty that we have experienced has been in finding a sufficient quantity of domestic bills for the purpose, and this difficulty has been met by the manufacture of bills by transfer from cash credit accounts. Objections have been raised to this procedure on the ground that these bills are not considered to be self-liquidating.

9657. Do you consider that a substantial objection?—I do not. I consider that the business which is behind these advances is the business which does create the true seasonal demand and that the advances do gradually liquidate themselves. Take, for instance, jute. The advances are granted in the early part of the year and gradually run off as the stocks are manufactured towards July when they are completely liquidated.

9658. I understand the position is that the business which might, in other systems of procedure, bring the bills into existence is there, but owing to the business methods in India the bills are not brought into being?—The present system of advancing business by cash credits is a very old custom and it is one which has worked very satisfactorily both from the point of view of the bank and the borrower.

* No. 7, printed at end of Mr. Murray's oral evidence.
† No. 2, printed at end of Mr. Murray's oral evidence.
‡ *See* Statement No. 15, printed at end of Mr. Murray's oral evidence.

9659. What would you propose to meet the situation, that the nature of the security upon which the seasonal currency can be brought into being should be changed, or that in some way the creation of bills should be promoted?—The only other way in which I see that you could alter the form of the security would be that if you reduce the Stamp Duty* on these bills to a merely nominal figure, mills might be induced to take a portion of their advances in the form of currency bills which would run off at an earlier date.

9660. That would promote the creation of bills?—That would still be promoting the creation of bills.

9661. Do the restrictions as to dealing with bills with one name affect the matter at all?—That does not affect that particular business. The bills on one name which might become available for that business are the bills we take from the small cultivator and the small dealer in the districts when we grant them advances against grain. These loans are all supported by actual goods and these loans do create a seasonal demand.

9662. Can you take those bills now?—We do not take those bills now. Those are loans as they stand at present and not bills, and they have no fixed date of maturity.

9663. Is it desirable that you should be able to?—I only suggest it as a possible alternative if this other business is objected to, but I see no advantage in it myself over the existing method. Another method possibly of creating a larger supply of trade bills would be a considerable reduction in the Stamp Duty. That might tend to encourage them.

9664. That is the method you have already referred to?—I was referring to it as a method which might encourage trade bills in the bazaar. What I was speaking of just now was really advances on produce.

9665. It is not your opinion that the provisions in this regard should be supplemented by extending the categories of securities against which the seasonal currency can be advanced?—I do not think it is necessary.

9666. As to remittance business, what is your opinion regarding the method of purchasing sterling in India? Has it worked satisfactorily? You are in favour of sale in London of bills on India?—I think it has worked very satisfactorily and I am in favour of its retention.

9667. What are the characteristic advantages of the method?—The advantage that I see in the method —we are talking of the purchase on this side—is that it is on this side that the liability to make the remittance is created, and as it is by India's exports that this home charge has to be met, I think India is the natural place in which to make this purchase.

9668. You are in favour of the purchase of sterling in India by tender? Has that been found to be a workable plan?—It worked very well in London before the War, and I see no reason why it should not work equally well out here, but I think, at the same time, that while, as a matter of practice, the business might be worked by tender, Government should still retain the right to go into the market whenever they thought it advisable.

9669. What would be the circumstances under which the Government, or the bank on behalf of the Government, would find it preferable to make its purchases privately?—In recent practice, on a rising exchange the Government have found it a very useful method of making their purchases.

9670. What would be the advantage obtained or the evil avoided by making the purchases in the market rather than by tender?—It leaves things more in the hands of the purchaser.

9671. Is it a question of it being desirable under some circumstances that the intentions and proceedings of the purchaser should not be too well known?—That is my idea.

9672. The point has been pressed upon us that publication of the amount purchased should be made as soon as the purchase is made. Is there any objection to that course? If so, how often should the publication be made?—Under the tender system publication was automatically made once a week; and I think under a system of purchase the same information should be given periodically.

9673. That is, it should be given weekly?—Weekly.

9674. That would not sacrifice this advantage of avoiding too great a publicity?—I think it would be a fair arrangement as between the taxpayer on the one hand and the market on the other.

9675. Now as regards reserves, can you assist us by telling us what precise advantages would, in your opinion, result, in the first place, from the administration of the banking and currency reserves of the country being under one control, and, secondly, another aspect, the amalgamation of the currency and gold standard reserves in the hands of the bank? First of all, the administration of the banking and currency reserves of the country being under one control?—The advantage that I see from placing the administration of the currency and the control of credit under one authority is that under two authorities working on different policies, the policies might clash and therefore stultify each other.

9676. It is a question of greater co-ordination of control?—Yes, unification.

9677. As regards the amalgamation of the currency and the gold standard reserves, what are the considerations there?—So far as it might be necessary to strengthen the currency reserve under any new standard which may be adopted, I can see an advantage in transferring such portion of the gold standard as may be necessary.

9678. That is only a transfer of some of the assets of the gold standard reserve to the currency reserve and maintaining a separate reserve?—Yes.

9679. Apart from the possibility of any such transfer, what is your opinion about the advantages of the unification of these two reserves?—The unification of the two reserves would mean automatic contraction of currency when the currency reserve has to be drawn on. But I think it is quite possible that circumstances might arise in which it would be injudicious to contract currency at the time when it was necessary to draw in support of exchange and in such a case I think the portion of the gold standard if held separately would be convenient.

9680. Is it not indeed rather a feature of any sound system that contraction of currency against diminution of reserves shall be automatic?—Yes; I quite see that.

9681. You fear that the contraction might, under such conditions, be too severe?—Yes.

9682. Could not that be dealt with by a familiar provision giving permission for an emergency extension?—It could be.

9683. And that is the manner in which, in fact, in other systems this situation is dealt with?—Yes.

9684. If we preserve an independent gold standard reserve, which would not so act as to automatically reduce currency in times of bad exchange, would that introduce an element of management into the system?—It would introduce an element of management, yes.

9685. Public opinion in India is likely to be very suspicious in regard to management?—Yes.

9686. Now on a wider question, do you desire to express any view about the policy of India having a gold currency in active circulation either (*a*) as a feature of an exchange standard or (*b*) on a full gold standard, and fully convertible internal currency?—Under a gold exchange standard I see no advisability in putting gold into circulation. In fact, I think it would be inadvisable to put gold into circulation unless there is a reasonable certainty of your being able to continue the supply; because if you put the gold coin into circulation you create a belief that the other forms of currency are readily interchangeable into gold coin and if you fail to supply the gold coin, you destroy that belief, and I think it is better not to create this belief than to create and then destroy it.

* *See* Statement No. 16, printed at end of Mr. Murray's oral evidence.

9687. But under the conditions, assuming a gold exchange standard, there would be no undertaking to convert either notes or rupees; the gold currency would simply be obtained by the minting of gold held by private holders?—Yes.

9688. Have you any opinion to express as to the desirability or the reverse of having such an additional gold coinage under an exchange standard?—No, I do not see any desirability.

9689. Would it, in your opinion, serve any useful purpose?—I think under a full gold standard. . .

9690. No; I was thinking for the moment of an exchange standard?—I do not see any advantage in it at all if there is any risk of its being withdrawn.

9691. Have you any opinion to express as to the desirability of a gold currency on a full gold standard, that is convertible notes and rupees?—I think under a full gold standard with rupee merely as a token coin, it would be very advisable to have a gold coin in circulation. I think the country would want it and I think it would have this advantage that if people realised that they could at any time change their notes into gold coin, it would decrease the tendency to hold gold coin in reserve and would free the reserves for investment in Government securities, Post Office cash certificates and similar investments.

9692. I will ask you further about that, if I may, in a moment. At present, just to continue our present line of thought, what is your opinion as to the extent to which a gold currency would be actively used in circulation? Would it displace notes or rupees to any material extent, and, if so, which?—I think, to begin with, it will go into circulation a good deal. I myself have had no experience of a gold coin in circulation except when I was working in a branch office some 20 years ago, when we began to put out gold into circulation. The gold disappeared to begin with and nothing came back to us but rupees. There were no notes then. After a few years it freely circulated in the bazaar. That leads me to think that if the gold coin goes into circulation it will go out very rapidly at first; but as soon as people begin to realise that they can always get gold coin in exchange for notes, they will find notes more convenient to handle, and notes will take the place of gold in circulation.

9693. Where was that branch?—That was on the west coast, Cochin.

9694. At first you think that, when gold was going out into circulation, it would be displacing notes or rupees?—At that time there were no notes; it was only displacement of rupees.

9695. You have not had any experience as to what the exact results will be upon the relative demand for gold, notes and rupees?—No, I have not any experience.

9696. Assuming a gold currency and a gold coin in circulation, what ought the coin to be? Ought it to be a sovereign or an Indian gold coin?—That must depend largely on the rate adopted. If the rate adopted is one which is divisible into an equal number of rupees, I don't think it is very material whether you have the sovereign or the separate gold coin. Sentiment will probably prefer a separate coin. But if the rate adopted is one which could make it divisible into an equal number of rupees, I think it will be certainly desirable to have a separate coin.

9697. Apart from that very material consideration, and supposing the rate was decided, are there any specific advantages in one rather than the other for the convenience of trade?—I do not think so.

9698. There is no point in having the sovereign because it is familiar in international trade?—I do not think so. Whatever coin it is, I do not think it will remain to any large extent in circulation.

9699. What are your views about the issue of small notes, notes for less than Rs. 5?—I very much regretted the dicontinuance of the small note; because I think it had a great value in educating the people to the use of the paper currency. At first there was a prejudice against it, but that prejudice disappeared as it became more familiar and I think if it is going to be reintroduced it should be introduced as early as possible before the effect of its previous issue has been forgotten. But, on the other hand, if any new standard which may be contemplated would entail an obligation or a liability for redemption of rupees at their currency value, I think it would be a mistake at present to increase that liability by issuing notes which will take the place of rupees and so increase the number that would be available.

9700. I understand that would drive more rupees back for conversion?—Yes.

9701. It has been suggested that if small notes, one rupee notes, be re-issued, they should be made limited legal tender—legal tender only for a certain small amount. Have you any opinion about that?—I would not limit its legal tender as long as the rupee remained full legal tender. I would make no difference between the rupee and the one rupee note.

9702. You would not give any colour for the opinion that there was any difference in status between them?—I think it would be a mistake to do that.

9703. Now as regards this question of limiting the legal tender of the rupee, I think there has been put into your hands a memorandum, has there not, in which a scheme is outlined for introducing a full gold standard, with gold currency available, and subsequent limitation of the legal tender of the rupee after an opportunity has been given for its conversion into gold?—Yes, I have seen that.

9704. What is your opinion as to the present system? Do you see any serious disadvantage in the present system, under which the rupee is unlimited legal tender, and are those disadvantages of sufficient importance to justify the scheme to which I have just referred?—The disadvantage I see in the present system is the danger that what happened before might happen again when the silver value of the rupee might rise over the currency value, and then your rupees would disappear.

9705. I understand you would have a full gold standard?—If you have a full gold standard that disadvantage would disappear.

9706. Because, after you had limited the legal tender of the rupee, you could substitute some other form of small change?—Yes.

9707. You have referred to the desirability of a gold currency under a full gold standard. Have you ever been interested to make any of the estimates which are necessary in considering the practicability of the introduction of a full gold standard involving the acceptance of the obligation to convert rupees into gold for a period preparatory to limiting the legal tender of the rupee? The principal estimates have been two in number: (a) the amount of gold which would be required in order to carry out that policy, and (b) the cost of the policy?—No, I have never attempted to work that out, Sir.

9708. Do you desire to make any suggestions, supposing that there were to be a transfer of the management of the paper currency to the Imperial Bank, as to the detailed arrangements for that transfer?—No, I have no suggestions to make at present except that in the event of a transfer I think the transfer would also have to be made of the expert and experienced staff of the Currency department.

9709. Would that present any practical difficulties?—I do not think so.

9710. The Currency department could then operate with equal facility as a department of the Bank?—As a department of the Bank, yes; I do not think there is any practical difficulty.

9711. What do you consider to be the outlook as regards co-ordination between the Government of India and the Imperial Bank. Supposing that the Imperial Bank becomes responsible for the note

issue, the control of the reserves and the remittance business, would there be any difficulty in geographical position, separation between Delhi and Calcutta and so forth, in maintaining the necessary co-ordination and consultation between the two?—I do not think there will be any difficulty as long as the Controller of Currency is, as at present, in close touch with the Bank authorities.

9712. I understand that you picture the situation would be very much the same as it is at present as regards communications?—I think so, Yes.

9713. Carried on through the same channels?—Yes.

9714. Have there been any complaints from the Indian joint stock banks about the competition of the Imperial Bank, and, if there have, in your opinion are such complaints justified? What policy would you propose to avoid any legitimate complaints of the sort supposing the note issue were to be transferred?—Since the Imperial Bank came into existence we have only received one complaint from an Indian joint stock bank and that came to us through the Government of India. Their main grievances were that we opened up at places where they had already broken ground and opened up branches, that we were in a better position than they were to secure business because of the facilities of free money which we enjoyed from the Government of India and because of the facilities for transfer of money from one branch where there is a treasury to another branch where there is a treasury. I have a certain amount of sympathy with that particular bank because they did useful pioneer work, and for some time they enjoyed a monopoly of business at the branches which they had opened, and they naturally did not welcome us when we went there; but our going there was part of a larger policy, the policy of opening a hundred new branches, and those branches which we did open were with one exception treasury branches, and it was important for our policy to take over the treasury work from Government in these places. It is quite true that we are competing with them there, but, at the same time, we are competing on very fair terms, and if we can give facilities to the public which they cannot give to the public, I think it so much the better for the public.

9715. Have you been able to meet the contention as regards the greater facilities for transfer enjoyed by the Imperial Bank?—We have now made an arrangement* under which we supply banks at places where we are working and at which they are working with the transfer of funds at $\frac{1}{32}$ per cent. between places at which there are district treasuries.

9716. What about the banks' contention that you are getting the Government balances free and so getting a pull?—That is a very misleading contention, because they do not take into account the fact that we are doing a very great deal of work for Government, and though we pay no interest on those balances, we are paying very heavy charges in the conduct of the treasury work and doing a very great deal of work.

9717. In general you would contend that, although the competition may not be liked by another bank, it is a good thing for the public?—It is a good thing for the public, I think.

9718. We have gone into the existing state of the account as between the Bank and the Government and the relative advantages and considerations, and we are considering again the possibility of a transfer of the note issue. Have you any opinion as to what the terms of such a transfer should be in view of any additional advantage which would be given to the Imperial Bank?—I think it is very difficult at this stage to make any suggestion in regard to the terms because one does not know exactly what scheme will be adopted or under what conditions the currency will be handed over to the Bank; but a simple solution would be to guarantee the shareholders of the Bank a fair return on their money, that is, a return equivalent to what they are getting, or not less than they are getting now, and let the Government take the whole of the rest of the profits.

9719. I understand that you lay great emphasis on the simplicity of any arrangement between the two?—Yes.

9720. What effect would such an arrangement have upon the general policy of the Bank as regards profit-earning?—Well, an arrangement of that sort would free the Bank from entire dependence on its profits on its banking side for payments of its dividends, and to some extent would remove the necessity for considering the question of profits in any development of new branches of business throughout India which it might undertake.

9721. It might be said that the limitation of the shareholders' dividends would encourage public confidence that the business of the Bank was being conducted in the general interest of the country?—Yes, that is what I mean.

9722. Various alternatives have been suggested in the course of the evidence, Mr. Murray, and perhaps I may put them to you in order to ascertain what your view is upon them. Another alternative suggested is that part of the consideration to Government for the transfer of the profitable business of the note issue might take the form of a participation in the shareholding of the Bank?—For political reasons I think it would be a pity to bring the State into it as a part owner if it can be avoided.

9723. Another suggestion, differing slightly from your original suggestion, is that, without any limitation of the shareholders' dividends, the Government might take a share in the profits of the bank?—A fixed share?

9724. Yes, a proportionate share. That would, at any rate, not involve the specific disadvantage to which you refer of making the bank free?—Quite.

9725. Then it has been suggested that there should be a separate profit and loss account of the note issue department of the Bank and that the Government might take annually all, or nearly all, the profits shown therein. What is your view upon that?—I have not gone into the relative merits of the different methods, but the one which I have suggested is the one which appeals to me most.

9726. With regard to the last suggestion to which I have referred, that a separate profit and loss account should be kept of the note issue department, would that involve a Government scrutiny of the actual account of the note issue department in a very close manner and a certain amount of Government control over the expenses of that department?—It would necessitate very strict Government supervision.

9727. It would lead to something of the nature almost of divided control of the manner in which the note issue department conducted its business?—It probably would, yes.

9728. The final suggestion made is that the bank might pay the Government a percentage on the amount of the invested portion of the currency reserve over and above a fixed figure which would be free, and excluding any amount on which 6 per cent. would be paid in accordance with the suggestions made as to seasonal expansion or emergency expansion of the currency. Have you considered this suggestion?—It is quite feasible.

9729. Have you any opinion to express as to its relative desirability in comparison with the simpler method which you have suggested?—I would prefer the simpler method to any of these alternatives which have been suggested.

9730. Finally, there is one matter which, though remote, is not irrelevant to the subject under reference, and that is to ask you whether you have any suggestions to make in regard to the means of spreading the habit of investment and the use of banking

* *See* Statement No. 19. printed at end of Mr. Murray's oral evidence.

facilities in India?—I have already suggested how I think the Imperial Bank should spread its banking facilities; and the Imperial Bank are also at present interesting themselves in taking active steps towards the formation of an All-India Bankers' Institute which will provide banking education, and I think that the spread of banking education and the spread of banking facilities is likely to do more than anything else to encourage the spread of the investing habit. In addition to that we have at present instructed all our branches throughout India to purchase and sell Government securities on behalf of the general public in addition to our own constitutents at a fixed charge, and I think that may help to facilitate the investment habit.

9731. Are there any other statements or returns which you have been able to prepare for the information of the Commission to which you have not referred in the course of these questions?—I do not think there is any other statement of any importance.*

9732. (*Chairman.*) Perhaps you would be so good now as to deal with any supplementary questions which my colleagues may ask you.

9733. (*Sir Reginald Mant.*) The Chairman asked you just now how Government would maintain touch with the bank if the note issue were transferred to the bank, and you said that you supposed it would do so through the Controller of Currency, but I understood you to say that the bank would take over the currency department with its personnel?—There would still, would there not, have to be some officer of the Finance Department who would take over a good many of the duties of the Controller.

9734. You mean that Government would still maintain an officer?—Yes; I may be wrong in using the word Controller: I meant some officer of the Finance Department.

9735. At Calcutta?—At Calcutta, or wherever we happen to be.

9736. Government would have to keep some officer at the headquarters of the bank?—Government would have to keep some officer in touch with our headquarters.

9737. Just one other question: Have you thought out a system of tender for purchase of sterling in India?—I have not worked it out, but I do not think it should necessarily present any insuperable difficulty.

9738. The tenders would have to be collated at one centre?—They would have to be collated somewhere.

9739. And you would do that by telegram?—Yes.

9740. The Bombay Chamber of Commerce expressed a strong opinion in favour of remittances being effected by public tender; they say that this method is more equitable and promotes a greater feeling of confidence in the minds of the public. I understood you to say that you would still maintain the present system of purchase as supplementary to the tender system?—In normal practice I think the system of tender would be more equitable.

9741. Could you not get over the objection raised in Bombay by some arrangement such as is occasionally adopted in London of selling intermediate council bills at a fixed rate between weekly sales? Could you not do that in India?—You could still do that, yes.

9742. If you adopted a system of that kind, you would avoid all criticism on the ground of secrecy?—Yes.

9743. And you think that that would be a possible system?—Yes. I think it would.

9744. (*Mr. Preston.*) With regard to these statements you put in of the bank's sterling sales for 12 months, you make the total amount to be six millions. These sales represent absolute sales to your own constituents?—Yes.

9745. In every sense within the Act?—Within the Act.

9746. With regard to the statement you make of your assets in London, I did not catch exactly what you explained to the Chairman as to the nature of those loans?—All those loans are loans granted on securities which are held in India, to our own constituents.

9747. Loans given in London against securities here?—Yes.

9748. Does that come within the Act?—There is nothing in the Act against that, as long as the borrowers are constituents of the bank.

9749. Going back again to that sterling position, it would look as though you were uncovered in exchange on this balance, is that so?—That is so, yes.

9750. (*Sir Purshotamdas Thakurdas.*) A few witnesses have mentioned to the Commission a general suspicion lurking in the minds of the Indian public that the Imperial Bank do not give full facilities to the Indian Commercial and industrial community on a par with the European commercial community. Can you put before the Commission any figures or facts to challenge this allegation *primâ facie*?—We recently took out some figures showing the amount of our industrial advances to Indians and to Europeans. I have a copy of that statement* here. This concerns only industrial advances and it shows that our industrial advances to Indians totalled Rs. 13,14,00,000 while our advances to Europeans totalled Rs. 7,70,00,000. With regard to deposits and general loan facilities if the Commission would like to call for a statement showing our deposits under the head of Indians and Europeans and our advances under the head of Indians and Europeans I have no doubt the bank would be glad to submit it, and I am sure the statement will show that we receive more deposits from Europeans than from Indians and we lend more to Indians than to Europeans.

9751. I must say that those who made this allegation have not, for reasons which they have not been able to explain to us very fully, been able to give us facts in support of their allegation; and I felt that if you could put forward any figures *primâ facie* which would show there could not be much in it on the whole, it might help us?—I am sure the bank will be very glad to produce figures to show exactly the extent of our advances to Indians and to Europeans.

9752. (*Sir Purshotamdas Thakurdas.*) May I then take it that you would then send the Secretary a statement of the commercial advances on similar lines?

9753. (*Chairman.*) Let us first understand that it can be provided. Perhaps we may mention the matter afterwards amongst ourselves, as long as Mr. Murray knows just what he has to send. Would you repeat it, Mr. Murray?—It would be a statement in which we would show the total amount of our deposits divided under the head of European and Indian, and the total amount of our advances in the same way; because it is quite untrue to say that we discriminate in any way unfairly between Europeans and Indians; in our own interests we have to consider every proposition which is put before us on its own merits as a proposition.†

9754. (*Sir Purshotamdas Thakurdas.*) Regarding the reply that you gave to the Chairman in connection with the terms of the division of profits if you take over the currency department, I understood you to say that you would suggest government guaranteeing the present dividend and the Government taking the balance of the profits?—Yes; that is really a personal suggestion thrown out by myself.

9755. Your whole evidence being personal as you have said already, I take it that this is your personal opinion also. I just wanted to follow that up in order to understand it a little more clearly; you recommended that suggestion of yours strongly in preference to other suggestions, owing to its sim-

* Certain further statements were subsequently put in by Mr. Murray, and are printed below, together with those which are referred to in his oral evidence.

* No. 8, printed at end of Mr. Murray's oral evidence.

† *See* Appendix No. 48

plicity. It strikes me that unless you also have in mind substantial alteration in the constitution of the Board, both central and local, controlling the bank's interests, there would hardly be any incentive to representatives of shareholders for progress in the direction of additional prosperity to the bank? —What I had in mind was to ensure prosperity to the shareholder by guaranteeing his dividend and to suggest what I thought would make for the greatest prosperity of the country.

9756. You mean to ensure to the tax-payer that he would get the benefit of any facilities which may be enjoyed by the Imperial Bank?—What I really felt was that under this arrangement any development of banking in the country would be at the expense of the tax-payer and not at the expense of the shareholder of the Imperial Bank.

9757. But would you not recommend a change in the control then?—I think in the event of the currency and the responsibility for the maintenance of exchange being handed over to the bank that there probably would be some change in control.

9758. In fact, the shareholders' representatives should be, if not in minority, at least half the total? —I would not like to make any suggestion in regard to that.

9759. Because I really feel that unless you give the person or the interest which is going to have the surplus of the profits after a guaranteed dividend, substantial representation and control?—There would have to be, I do not say control, but there would have to be very substantial supervision.

9760. Supervision over the controlling body?— Supervision over the general business of the bank and its management.

9761. Even when you take over the currency, I take it that the Imperial Bank would have to do the day-to-day business which it does to-day?—That is what I would like to see. Under any circumstances, whatever happens, I hope the Imperial Bank will continue to work on the lines on which it is working now, because I think that is what is in the best interests of the development of banking in the country.

9762. That being so, the question of management and a live management is very important?—It is very important.

9763. And if the interest of the shareholder is restricted by a fixed dividend?—The interest of the shareholder would still be very important.

9764. Not in the shape of any increase on dividend at all, Mr. Murray?—He would still draw a dividend equivalent to what he is drawing now.

9765. Which would be guaranteed by the Government irrespective of profit or loss?—Quite so. That was the suggestion I threw out.

9766. *Chairman*: I rather gather your view is that what India needs as regards banking is courage in developing a class of business which will not be remunerative, at first at any rate?—Wherever we go, as has been shown by the opening of these new branches, we must be prepared to face loss for some little time to come.

9767. And you propose your recommendations as regards the guaranteed dividend to the shareholders in order to produce such a position that the directors of the bank would have courage in developing business which would not at first be remunerative?— They would have to be prepared at first to do that without prejudice to their shareholders.

9768. As regards the question which was raised in the course of previous questions about the management of Indian sterling loans in London by the Bank of England, my attention has been called in the first place to Section 23 (5) of the Government of India Act, which is as follows:—" There shall be raised in the books of the Bank of England such accounts as may be necessary in respect of stock vested in the Secretary of State in Council; and every such account shall be entitled 'The stock account of the Secretary of State in Council of India.'" That, I understand, is one of the statutes to which you referred which stands in the way of advancement? —Yes.

9769. Secondly, it has been called to my attention that there are certain privileges as regards stamp duties which are attached by statute to sterling loans by the Secretary of State for India which are carried on the books of the Bank of England, and it is said that these privileges are peculiar to the Indian loans. Is that within your sphere of knowledge at all?— No, it is not.

9770. (*Chairman.*) I am told that such privileges are not shared by Colonial and Dominion Government loans.

9771. (*Sir Norcot Warren.*) It is within my knowledge, Sir.

9772. (*Chairman.*) We may take it that that is so, that there are such special privileges in respect of certain stamp duties. It is suggested that it is a matter for consideration whether there is any danger of losing such privileges by any new arrangement. That, no doubt, is a matter which will have to be taken into consideration?—Yes.

9773. Are there any matters in regard to which you desire to supplement any of the questions which have been asked?—No, none at all.

9774. (*Chairman.*) Then the Commission is very much obliged to you, Mr. Murray, for your assistance and your very full answers to our questions to-day.

(*The witness withdrew.*)

STATEMENTS SUBMITTED BY Mr. NORMAN MURRAY.

No. 1.

Imperial Bank of India.

Restrictions on Business under the Imperial Bank of India Act.

The Bank is *specifically* prohibited from:—

1. Making any loan or advance—
   (*a*) For a longer period than six months.
   (*b*) Upon the security of stock or shares of the Bank.
   (*c*) On the original security of immovable property.

2. Discounting bills for or lending or advancing in any way to any individual or partnership firm an amount exceeding at any one time Rs. 20 lakhs except on the security of trustee stocks, funds and securities, securities issued by certain State-aided railways, the debentures and other securities issued by District Boards under the authority of the Legislature, and goods or documents of title thereto.

3. Discounting or advancing on bills, etc., of any individual or partnership firm payable at the town or place where they are presented for discount which do not carry on them the several responsibilities of at least two persons or firms unconnected with each other in general partnership.

4. Granting unsecured overdrafts in excess of Rs. 1 lakh.

5. Opening accounts in the London Office for persons other than its Indian constituents.

The Bank is *generally* prohibited from transacting any business not specified in the Act; this prevents it from sharing in the finance of the *external* trade of the country.

Similar restrictions, with the exception of that on the business of London Office, were placed on the business of the late Presidency Banks by the Presidency Banks' Act, 1876.

No. 2.

MANAGEMENT OF THE PUBLIC DEBT OF INDIA BY THE IMPERIAL BANK OF INDIA.

Under the Banks' Agreement with Government the entire management of the registered Public Debt and Securities for the time being of the Government of India and the Secretary of State is undertaken by the Bank. This includes:—

1. The calculation and payment of interest.
2. The consolidation, division, cancellation, renewal and enfacement of Government Securities.
3. The flotation of new Loans.

The Bank's remuneration for the work is as follows:—

Rs. 2,000 per crore per annum. The total amount received in 1924 was Rs. 6,33,100.

The Bank's London Office manages the Government of India Rupee Debt inscribed or enfaced for payment of interest in England.

The Bank's remuneration is as follows:—

£.300 per crore per annum with a minimum of £.5000 per annum but if the balance falls below 8 crores in any one year the commission to be reduced to £.4000 per annum.

Transfers for other Banks.

Local Head Offices and Branches have been instructed that the normal rate to Banks for transfers between our Local Head Offices and Branches at places at which there is Treasury and at which there are other Banks and also between such Branches will be 1·32 per cent. These instructions do not apply to transfers on Colombo.

Mr. DURAISWAMI AIYAR, called and examined.

9775. (*Chairman.*) Mr. Duraiswami Aiyar, you are acting University Professor of Economics in the University of Madras?—Yes.

9776. Since when have you held that appointment?—It is now about eight months.

9777. And before that?—I was a Reader in the same University.

9778. For many years?—For 4½ years.

9779. And before that?—I was lecturing in a first-grade college on History and Political Economy, and before that for years I was in a first-grade College.

9780. Your experience has been that of a teacher and a professor?—Yes.

9781. You have been good enough to provide us with a full and very closely reasoned memorandum* setting out your opinions upon the subjects of our reference. As I find from your memorandum, Professor, it would appear that your object has been to anticipate every possible question, which leaves very few questions to be asked in this case. I would, if I may, just ask you a few questions to elucidate anything which seems to require further explanation in the course of your memorandum. I understand from paragraph 6, that, after a very full analysis of the position, you come to the conclusion that the time is ripe for some measure for the regulation of Indian currency and the stabilization of the rupee?—Yes.

9782. Indeed, I understand your view to be that the time is over-ripe for that purpose?—Yes.

9783. If I pass over paragraphs of your memorandum it is because I find them so full that they leave really no questions to be asked, and I must not delay you with a repetition of what you have so kindly explained in full in your memorandum. I understand that you are amongst those who place special emphasis upon stability in exchange?—Yes.

9784. And you would not sacrifice stability in exchange for the sake of any attempt at stabilization of internal prices?—Yes, it is a relative question; exchange stability I prefer.

9785. You are no friend to proposals for the management of a currency with a view to the absolute stabilization of internal prices?—No, as far as possible it is better to avoid it, though there cannot but be some management in any kind of currency.

9786. You tell us that there must be some management in any kind of currency?—Yes.

9787. Perhaps you would expand that a little, by telling us what the management is in a currency based upon gold in the sense of having an internal gold currency and a fully convertible internal token currency. What is the degree of management in such a currency?—In such a currency as you have mentioned, the amount of management is very small. For instance, the bank rate may have to be raised with a view to prevent the flow of gold from such a country whereas under a gold exchange standard or under conditions where you want to secure internal price stability, index numbers have to be watched; there cannot be any certainty about the degree of confidence about the index number; and thus the amount of management comes to be extraordinarily great.

9788. The management attains its maximum in a currency in which an attempt is made to fix the standard by reference to prices as evidenced by an index number?—Yes.

9789. The management attains its minimum in a currency as that to which I have referred based upon a gold currency with fully convertible notes or other tokens?—Quite so.

9790. Nevertheless in such a currency as that there is a degree of management involved?—Yes. There is a slight degree of management.

9791. And that is the management which is involved, first of all in the control of bankers' money by the discount rate, and, secondly, if it can be said to be management, to maintain the ratio between the reserves and the token currency?—Quite so.

9792. I think I find the emphasis of your opinion in favour of a stable exchange contained in the following sentence in paragraph 10: "There is severe competition in international trade, and wholesale traders engaged in the export and import trade of the country work on the basis of a narrow margin of profit on each unit of their turnover. Exchange fluctuations are likely to cut into the narrow margin of profit or bring about undeserved gains. The uncertainty involved destroys a large amount of trade which otherwise will flourish. Speculation is promoted and healthy activity in trade and commerce is checked." Is that, as it were, a summary of your argument in favour of exchange stability?—Yes.

* Appendix No. 45.

9793. Then in paragraph 11, where you turn your attention to the question of the effect of a high or low rupee, you range yourself with those who consider that "it does not matter whether the rupee has a high exchange value or a low one when once industry and trade have adjusted themselves completely to the high or low value."—Yes, Sir, except with reference to the burden of the debt where it matters and long-term obligations.

9794. Long term obligations are the last to adjust themselves?—Yes, and debt burden also; if there is a high rate naturally the debt burden is heavier.

9795. What sort of debt have you in mind now?—The debt on the part of private individuals, say agriculturists and also the debt of the Government of India, the rupee debt.

9796. Long-term debt?—Yes, long-term debt.

9797. That is a contract which cannot be terminated and replaced by a fresh contract?—Yes.

9798. That is a particular case in your generalisation, in which you reserve the circumstance that industry and trade have adjusted themselves, because as long as long-term contracts are outstanding there cannot be a complete adjustment?—I was not referring to that kind of adjustment; I was referring to the short term adjustment; prices of commodities being adjusted, wages being adjusted to prices, prices of raw material being adjusted and things of that kind. I do not include in that adjustment long term obligations.

9799. The time in which the adjustment takes place is only a question of degree, is it not? The longer the term of the contract, the longer the time must be before the adjustment can take place?—Yes; it is a continuing burden.

9800. The burden is continued as long as the contract is continued?—Quite so.

9801. Until it can be replaced by a fresh contract on a new basis?—Yes.

9802. So that we may say that, only give it long enough, the effect of any change in the rate of exchange is neutralised by adjustments in prices, rates of wages and other charges?—Quite so; the price has to be paid of course for it in the meantime.

9803. The price in the meantime being some disadvantage to either the debtor interest or the creditor interest, the exporting interest or the importing interest, according to whether the exchange rises or falls?—Yes; or to the wage earner or to the employer.

9804. It is an aspect of the debtor and creditor question?—Quite so.

9805. You follow it by a very close analysis of the effect of a high or low exchange and a rising or falling rupee upon various important categories in the social complex?—Yes.

9806. In the same paragraph, paragraph 11, you say: "As regards the influence of a high or low rupee on national finance, since land revenue in ryotwari areas is fixed for a term of 30 years high rupee means a greater real burden for the ryot." You also deal with the interest on the national rupee debt. Are there any other long term contracts which are worth specification in considering this analysis?—Private contracts, for example the debt of the agriculturist: though you cannot quite say about it that it is a very long term obligation, it is more or less continuously renewed. But still there is some point in this that with a high rupee, suddenly the real burden of the debt of the agriculturist is increased in terms of commodities.

9807. We have been given evidence to the effect that the debt of the agriculturist is in two forms; first of all, in the region of higher finance, in the form of mortgages which may be for 5, 10 or 15 years. That seems to be the usual period: is that so?—I do not think the period is specific in a large number of cases.

9808. For legal mortgage?—I have not very great experience of such things; but so far as my experience goes, usually they specify a year or two.

9809. A shorter term than that I have referred to?—Yes; but it usually continues for a longer period. If the specified period is one or two years, the borrower is not in a position to repay the loan and it extends to 5, 7 or 8 years.

9810. That is rather a second classification which I was about to refer to, *viz.*, the ordinary borrowings by the small cultivator from the moneylender to which no term is fixed, which are either callable or repayable at any time?—Yes; it is more or less continuously renewed. If you have good crops, the debt is repaid.

9811. That is not in form a long term contract?—Yes.

9812. In substance you say it might amount to such, because the borrower is unable to repay?—Yes.

9813. In paragraph 13 you say that the producer of commodities which are not exported and which have not to compete with imported goods is not affected adversely to the same extent as the producer of commodities that find their markets abroad or that have to compete with imported goods?—Yes.

9814. I understand that your view there is based upon the argument that since there is no competition, *ex hypothesi*, between these goods such as grains, foodstuffs, and imported goods of a more expensive nature, the price of the one does not affect that of the other?—I do not think it does not affect altogether. There is a time lag, of course.

9815. There is a time lag?—Yes; in course of time, the adjustment must take place. After all there is a certain level of relative prices, as between the prices of commodities that are not in competition with commodities produced elsewhere and commodities that are produced in India and that compete with imported goods. In course of time, therefore, there must be adjustment, but during the interval, there is a time lag.

9816. That I understand, but it is very difficult to find any commodity which suffers from no competition at all?—Chillies, for example, ragi, pulses, all these are produced largely for internal consumption. They have not got very large and extended external markets, and consequently their prices are not so much regulated by any prices of imported commodities.

9817. What is ragi?—Ragi is a kind of foodstuff that is largely used by the poorer classes of the population, a very important commodity in so far as consumption is concerned.

9818. Is it a cereal?—Yes, it is a cereal; it is used in the south.

9819. *Sir Alexander Murray*: Is it dhall?—No, it is not dhall. I do not know the Mahratti translation of it.

9820. *Chairman*: The Secretary tells me it resembles rice?—Yes, it resembles rice.

9821. *Sir Purshotamdas Thakurdas*: Coarse rice?—It does not come under the rice category. It resembles rice.

9822. Is it something like bajiri?—Yes.

9823. That is a millet?—Yes; it is used as a foodstuff by the lower classes.

9824. But bajiri is used by us?—But in our parts ragi is used by the poorer classes. India is a continent, you know. The upper classes there in Madras do not use ragi.

9825. *Chairman*: We are considering here, in this paragraph, the question of the falling rupee. Generally speaking, supposing one desired to produce a fall in the rupee, the mechanism for it would be some form of increase of the internal currency?—Yes.

9826. That would be an increase in the volume of the internal currency in comparison with the goods and services which that currency is used to buy?—Or it may be a fall in the gold prices elsewhere.

9827. Let me exclude that. Increase in the volume of internal currency?—Yes.

9828. Which is, in its more marked degree, ordinarily called by the somewhat derogatory name of inflation?—Yes.

9829. When you have an increase in the relative amount of internal currency, in the nature of inflation, producing a fall in exchange, if there is anything in the quantity theory of money must not that produce a general rise in all prices, whether they are subject to competition or not?—Yes; there ought to be a general rise. The commodities that enter into international trade naturally will have to be regulated by world prices. Consequently they cannot get away from that inflation. Then the result of inflation will have to be adjusted to the need for price parity between the price of commodities in the country and the price of the same commodities elsewhere.

9830. But they can only be bound to world prices in equity if the gold value of your currency is stable. I am assuming an inflation of the internal currency, which results in a fall in the gold value of your currency. Under those circumstances, on the monetary theory must not there be a general rise of all prices whether they are subject to competition or not?—Quite so.

9831. You say in paragraph 13 that "the imported commodities will fall in rupee prices as a result of a rising rupee, and to the extent that the Indian producer, agricultural and industrial, consumes imported commodities, he gains from the fall in their prices." Of what importance are imported commodities to the poorest classes of the Indian cultivator?—Not much, except that in a very distant way the price of iron and steel, hardware, cotton goods and things of that kind, which they use will be affected favourably.

9832. Hardware and cotton goods?—Yes, hardware and cotton goods; these are the goods that the ryot consumes, and, therefore, he will experience the favourable effect.

9833. Are there any others? Sugar?—Sugar the poorest classes don't consume. There is not exact correspondence between the country sugar which he consumes and the foreign sugar. To my mind there is no exact correspondence.

9834. There is a lag between the jaggery and imported sugar?—Yes; there is lag and consequently sugar, I do not think, will count for much.

9835. Are there any other imported commodities which he consumes?—As I told you, iron, steel and such other commodities as are produced and used for productive purposes have indirect or remote effects on all classes who consume the goods produced as a result of the application of machinery. In that distant way it has an effect. That is all that I can think of.

9836. Continuing your analysis, you point out in this paragraph: "A falling rupee, on the other hand, will favour the producers of commodities the bulk of which is sold abroad, while the producer of pulses and jowar will not find his products rising in price corresponding to the fall in the exchange value of the rupee until after a considerable lapse of time?"—Yes.

9837. Are there any statistics which will give us an idea as to the relative importance of the interests involved in the case of producers of commodities, the bulk of which are sold abroad, and the producers of such commodities as pulses and jowar which are not exported?—The agricultural statistics of India will give us figures relating to the acreage under *ragi*, the pulses, the various millets, &c.

9838. You have not by any chance got those figures out, have you?—No, I haven't got those figures.

9839. We can refer to them in following up your argument on the basis, if your contention is correct, that the producers of exportable commodities will benefit more from a falling rupee than the producers of unexportable commodities?—Yes.

9840. In paragraph 14 you consider the relative importance of land revenue, customs revenue and income tax from the point of view of the interests involved in a rising and falling rupee, and your argument there is summarised, I think, in the following sentence: "Consequently the beneficial or adverse effect of a rising or falling rupee on national finance during recent years when customs revenue and income tax together bring double the amount that land revenue brings is not so great as was the case before the war," your argument being that the land revenue does not adjust itself from the point of view of national finance to the change in the rupee up or down, but that customs revenue and income tax do show adjustments in proportion to the rise or fall in the gold value of the internal medium of currency?—Yes.

9841. So that the importance of customs revenue and income tax having increased in contrast with the importance of the land revenue, the revenue system of the country has become more elastic in adjustment to a rise or fall in the rupee than it used to be. Do I follow your argument correctly?—Quite so, that is what I mean.

9842. Now you proceed to consider the rate at which the rupee should be stabilised, and you commence your argument on the basis that the rupee should be stabilised in relation to gold. Here you point out that one consideration which makes a difference between the absolute appropriateness of a higher or a lower ratio is the question of the value of silver?—Yes, that is one of the considerations.

9843. The higher the gold value of the rupee the less it has to fear from a rise in the silver market?—Yes.

9844. You point out that, whereas commodities in general have increased in price by about 50 per cent. compared to 1913 and 1914, silver which stood at 28d. per ounce in 1914 now stands at no more than 32d., so that it has not risen in proportion to the general rise in the price of commodities; and I understand you think it is more natural to contemplate, in view of that, a rise in the price of silver?—That need not necessarily follow. That depends on the demand for silver and the supply of silver in the world. It all depends to some extent on what India decides. If it is decided not to have the old gold exchange standard, with the rupee mainly circulating in India, if the minting of silver rupees is dropped altogether, the demand for silver is likely to be less than what it was under the previous state of affairs.

9845. And the price of silver would then be likely to be less?—Yes.

9846. If India were not only to go out of the silver market in connection with any new currency system but also to require to sell silver, then it would follow that she would get less for the silver she desired to sell, and that would, as I understand it, be in your opinion an adverse circumstance from that point of view?—Yes.

9847. You point out that "if silver were to stand at a price at the present day on a parity with the price of all commodities it must reach 42d., and at 43d. per ounce the intrinsic value of silver becomes equal to the face value of 1s. 4d." That would leave a very small margin for comfort?—That depends on the supply of silver and the demand for silver. If the same demand were to continue, that is, if India were still to have the minting of silver, in that case there would be trouble.

9848. It might prevent such a rise as might otherwise be foreseeable to bring silver into line with the general rise in other commodities?—Yes.

9849. A little lower down, in continuing your analysis of the position as regards the ratio to be fixed for the rupee, you say, towards the end of paragraph 15: "In the controversy that is carried on over the rate for the rupee the remark is often made that the agriculturist loses 40 crores of rupees as a result of the rise from 1s. 4d. to 1s. 6d. of the rupee. This statement cannot receive scientific support." I understand the support for your latter opinion is contained in the following sentence: "It cannot be forgotten that the rise in exchange will

bring down general prices in the country and consequently the agriculturist will gain on his purchases." So that your argument, as I understand it, is that although the agriculturist gets less for what he sells he pays less for what he buys, and you must look at both sides of the book in considering what he has lost or gained?—Yes.

9850. In order to do full justice to your argument I should read the next sentence: "To the extent, however, which his purchases are of commodities which are locally produced have only a local market and do not suffer from the competition of imported goods, he will not secure the benefit of a fall in price unless time is given for the adjustment of the prices of such commodities to the rise in exchange." That is what we have already dealt with?—Yes.

9851. You then proceed to a very full analysis of the reasons for and against the 1s. 4d. and the 1s. 6d. rate. If I may say so, the analysis is so full and clear that I really need not ask you to cover the ground again; but we begin to approach the conclusion in paragraph 23, and I understand that, on a balance of considerations, you finally come down on the side of 1s. 4d. Is that correct?—Yes.

9852. "The governing consideration," you say, "is the general interest of the country, and that seems to point more in favour of 1s. 4d. than 1s. 6d."?—Yes, Sir.

9853. Should I be right in thinking that your leading reason for coming down on the side of 1s. 4d. is contained in this paragraph, and particularly in the sentence: "1s. 4d. gold will mean in the circumstances at present increased rupee prices which will serve to strengthen industrial enterprise"?—That is one of the considerations and a very important consideration.

9854. Let me ask you, then, in order to appreciate the emphasis of your arguments, which are the other most important considerations in favour of the 1s. 4d. rate?—Between 1899 and 1917 we had been accustomed to 1s. 4d. gold and with that ratio India prospered more than during any other period in the history of the British connection. That is also an important consideration that has to be taken into account. Simplicity is gained and a certain continuity is maintained, and in currency matters as far as possible unless we have strong compelling reasons I do not see sufficient point in departing from the rate of 1s. 4d. There is another point. Just as devaluation involves repudiation, an increase in the value means an increased burden on the taxpayer in respect specially of the debt charges that he has to pay, and also on the private borrower in respect of his debts. Those are all considerations to be taken into account.

9855. I asked you the question in order to see which of the very nicely balanced considerations really are foremost in your mind. Let us take them one by one; and in asking you questions to test your opinions in that regard you will understand that the questions imply no preference on the part of the questioner. In the first place, you say "1s. 4d. gold will mean, in the circumstances at present, increased rupee prices which will serve to strengthen industrial enterprise." What would you say in reply to a critic who said: That is a familiar argument in favour of inflation all over the world at any time, and the common experience of countries which have tried inflation, increased prices, in order to strengthen industrial enterprise is that it brings with it a harmful reaction which does more harm than the original benefit?—I don't think it is right to compare this question of 1s. 4d. gold with the sort of inflation which occurred in some countries recently and which brought with it great harm. That way of putting it I don't think is quite fair to those who call for 1s. 4d. gold in this country.

9856. There is a certain superficial similarity, is there not?—Very superficial.

9857. What is the fundamental difference?—I should put it this way. Till a year back it did not reach 1s. 4d. gold owing to the disturbed conditions since 1920; so that to consider 1s. 4d. gold as inflation, to consider such a rate the result of inflation is giving the whole thing a bad name which it does not deserve. That is what I feel about it, Sir.

9858. I suppose what inflation means is increasing prices in order to stimulate trade by increasing the quantity of money in relation to the things which the money buys?—Yes.

9859. Is it possible to distinguish between your argument here where you say "1s. 4d. gold will mean, in the circumstances at present, increased rupee prices which will serve to strengthen industrial enterprise," and the argument of inflation?—I should think so; there is a distinction. Inflation has an evil odour about it. Where artificial currency is promoted and artificially the employer is benefited at the expense of the wage earner, that is one thing; here where industry is actually suffering as a result of a rise in the value of the currency, when an effort is made to keep to what has been obtaining all along, I do not think that is the same kind of inflation as the other thing.

9860. Really, if I might construe your argument, it would be this, would it not, Professor, that this is not inflation, because prices and conditions have not yet adjusted themselves to the 18d. rupee?—I do not think I would put it quite in that way.

9861. Do you think they have adjusted themselves? —They have not adjusted themselves, but that is not my main point. I do not see any particular point in this 1s. 6d. One could as well take 1s. 8d. There does not seem to me any compelling character as regards this 1s. 6d. rate. That is my difficulty as regards accepting this rate.

9862. We are going to examine the four principal reasons which you give. Before I pass on, I should like to say that I still do not quite apprehend how you would distinguish in nature the proposal which you make from a proposal to inflate in order to stimulate industry, unless your argument is that prices and wages and so on in the country are still substantially adjusted to the 16d. rupee. If they are still substantially adjusted to the 16d. rupee, then to adopt that ratio need involve no inflation; if they are substantially adjusted to the 18d. rupee, then a return to 16d. means, does it not, some measure of inflation?—The first question is whether they have adjusted themselves to the 16d. rate or even to the 18d. rate. That is the first point to be taken into account. I do not know whether they have adjusted themselves either. There has been a very short time, and that time has not been enough for the adjustment to come into being. The second point, as regards that question of difference in substance between one kind of inflation and another, I would put it in this way: when gold production increased and prices went up, the prices went up naturally and there was no evil odour about the word inflation then; one could not help it and there was nothing to be said against it; whereas if we increase artificially the paper currency and if prices go up and in that way stimulus is given to employers, that is a different thing; so that between the one kind of inflation and another there is a very important and substantial difference that has to be taken into account.

9863. That suggests this question: the market rate now ruling being 1s. 6d., could we establish 1s. 4d. without some artificial increase in the currency?—There must be some increase in currency; or if you establish the 1s. 4d. rate taking into account our reserves and the condition of gold prices, 1s. 4d. will immediately come into existence and there would be some loss to certain interests.

9864. May I have that last answer again? I am not quite sure that I followed you?—If, for example, India decides on having 1s. 4d. now, to my mind immediately the 1s. 4d. rate will be the ruling rate

9865. Immediately upon the publication of an announcement?—Quite so.

9866. Supposing the Government were to say: "We are going to establish the 1s. 4d. rate immediately," we may agree that the operations in the market would send the rate to 1s. 4d. But supposing nothing else was done and no measures were taken to let out currency, would the rate stay at 1s. 4d.?—No; the very fact that Government accepts the rate for the purpose of carrying out of certain measures which would result in a larger amount of currency being available to the public, that fact necessarily involves it.

9867. Having arrived at that fact we need not quarrel over the nomenclature, need we, whether it is inflation or not. Let me take your second reason. You tell us that the 1s. 4d. rate was established for a long period of time, and that during that time India was prosperous. Now, as I understand your argument there, India was prosperous because the rate was 1s. 4d.?—I do not agree to that point. India did not prosper simply because the rate was 1s. 4d.; that is merely a coincidence. Fixity of exchange was an important factor; but if we had had 1s. 5d. I do not say India would not have progressed. 1s. 4d. is a coincidence, but none the less there it exists.

9868. One hardly finds an argument there for the return to 1s. 4d.; one finds an argument for fixity?—At any rate it is those who want any rate other than 1s. 4d. that have to defend the position; there it has been existing and consequently it has the privilege of possession of the field.

9869. It does not possess it now?—Not now; but all these days we have had disturbed conditions.

9870. You have had many rates ruling since the 1s. 4d. rate?—Those were during disturbed conditions; 1s. 4d. was the landmark; these others were passing shadows.

9871. During the last two years has India been prosperous or not?—Yes; we have had good monsoons, and in this country if we have good monsoons we always have prosperity. But if world trade flourishes we have more prosperity. If world trade now flourishes as it did before the war, we would have more prosperity.

9872. Prosperity depends, as we know, in the first place upon good monsoons?—Yes.

9873. And, secondly, in so far as exchange is concerned, it depends upon stability of exchange?—Yes.

9874. Your third argument in favour of 1s. 4d. was, I think, from the point of view of its simplicity?—Yes.

9875. Would you expand that a little, because I do not quite follow that for the moment? What sort of simplicity do you mean?—There is not very much in that argument; it only means that we have been accustomed to that for a long time, for about twenty years, which period we associate with budget surpluses and with expansion of various administrative organisations: fifteen rupees make one sovereign; there is that amount of simplicity which we would rather not depart from unless we have strong compelling reasons; that is all I mean; it is not very much.

9876. As regards simplicity, that really is only of importance if you are going to have a gold coin in circulation in India, is it not, particularly the sovereign?—Yes.

9877. If you are going to have the sovereign in circulation in India it would be awkward to have no simpler ratio between the sovereign and the rupee than 13 and a recurring decimal?—Yes.

9878. Could that be got over by having a special Indian coin which would be a whole number of rupees?—To that extent it could be got over; that particular difficulty could be got over.

9879. Secondly, you refer to the advantages of preserving continuity. Might not a critic of that argument say that it is rather late in the day?—Quite so; there is not very much in that; it is not of very great importance; if you have strong reasons which induce us to depart from it, I would not press these considerations.

9880. I mean, so many rates have ruled since 1s. 4d., have they not?—Yes.

9881. There has, in fact, been no continuity?—Yes; but that could not be helped.

9882. Then your fourth argument, which apparently ruled foremost in your mind, is the question of the burden on the tax-payer?—Yes.

9883. I am not quite sure that I quite follow that, because it might seem natural to suppose that, if you reduce the gold value of the rupee to 1s. 4d. from 1s. 6d., considering that you have home charges to meet, that at first sight would involve an increase of the burden on the tax-payer, would it not?—Yes; but I did not mean home charges when I said that; I meant only the rupee debt, the interest on the rupee debt; that interest becomes more burdensome with a higher rate; that was all I had in mind; and also the land revenue rate; other things do not affect; they tend to adjust themselves to any rate.

9884. That burden on the tax-payer would adjust itself in the course of the readjustment of prices to the new rate?—Quite.

9885. As regards any temporary additional burden on the tax-payer, it would be just, would it not, to take into consideration the additional burden involved in meeting the home charges as a result of the fall in the rate?—I feel there is not really any substantial burden there; in rupees and in units of rupees there is an additional burden, but there will be more revenue with a falling rupee; the customs revenues will grow.

9886. It is of a like nature with the other considerations, is it not, Professor, that counter-adjustments would make the position, in the course of time, the same as it was before; but in the meanwhile there would be a disadvantage: you would have to provide more rupees to meet the home charges?—But the customs revenues would immediately improve and the burden on the rupee debt would immediately go down; so that as against the burden in respect of home charges you will have these advantages; they will cancel each other.

9887. And similarly, on the other side, customs would come down immediately?—Yes.

9888. So that it is really six of one and half a dozen of the other?—Quite so; there is not much in that.

9889. I do not think we quite exhausted the question as to whether rates of exchange, prices and rates of wages were adjusted. I should like to ask you in that connection, as a result of your study of this subject, can you refer the Commission to any illuminating evidence on the question of whether prices have adjusted themselves, and, if so, to what extent, to the 1s. 6d. rupee, or to what extent adjustments are still incomplete?— I cannot refer you to anything in particular.

9890. For instance, in the first place, there is obviously the index number, for what it is worth; but I was wondering whether you had any other positive evidence, apart from mere surmise, as to whether adjustments have taken place?—There is no other positive evidence. The rise is from 1s. 4d. to 1s. 6d. gold; the rise has only been recent and consequently there has not been yet time for prices and wages to adjust themselves; it is very difficult to make any definite statement about it.

9891. You would surmise that the time has been too short?—Too short.

9892. Now will you tell us in very brief outline, Professor, what your recommendations as to the basis for the Indian currency are, the standard for India?—The minting of rupees is to be stopped; and further accretions to the currency should be in the form of notes preferably and gold coins. Immediately there ought not to be convertibility of rupees into gold for internal purposes. We will have to wait for some time and see how the whole

system works when we stop the minting of silver coins. Another consideration that makes me cautious in respect of this affair is the extent to which the rest of the world would agree to have a gold currency in future. It is not yet determined. The instinct for the use of gold is so strong that one cannot be quite sure as to what European and American psychology would be with reference to the use of gold as currency. On account of these considerations, I would not immediately advocate convertibility into gold of silver rupees. But the goal is paper money backed by gold. That is the goal. That is the best currency. But in the conditions of this country with a large illiterate population it is better to have gold coins also in circulation. Not that I am fond of gold coins as such, but that that is a stage through which you have to pass in this country taking into account the general condition of the country before we have the best thing, paper backed by gold. That is my position, Sir, briefly.

9893. Practically you would cease the coinage of rupees; that is the first step?—Yes.

9894. You would, as I understand, take no other immediate step?—Except as I point out that Government and the leaders of public opinion should have a decided preference for the enlarged use of notes and gold coins. To my mind, the great difficulty in India, especially the war has made it a very real difficulty, is that we are tied not only to the value of gold but also to the value of silver. That puts a double handicap on Indian trade and Indian industry, and I would have it removed by the recommendation that I make.

9895. Government, and the leaders of public opinion, should use their powers of psychological suggestion in favour of a more extended use of notes. In the meanwhile, as I understand it, you would ensure the stability of the gold value of the rupee by a continuance of something in the nature of the pre-war system?—You mean council bills?

9896. Yes?—Yes, gold obligations are discharged by them. You want some such system.

9897. You say the success with which the 1s. 4d. system was maintained furnishes a clue as to the measures that have to be adopted now; so that you would continue to maintain the stable exchange value of the rupee by some such measures as those which are substantially similar to the ordinary exchange standard system?—Though as I said it is only a passing phase.

9898. And you would meanwhile be preparing the way for a gold currency?—Yes.

9899. You do, as I understand, contemplate that, as soon as possible, India should reach the stage at which it should undertake to give gold against rupees?—Yes, but I would wish that gold coins really do not circulate, that paper circulates. But I would undertake the liability to give gold in place of silver after gaining a certain experience.

9900. In the meanwhile would you be providing gold for circulation in any form?—Yes.

9901. In what form? By what measures?—Whenever industries increase in this country exchanges multiply. When foreign trade is prosperous, there will be need for more currency, either in the form of notes or in the form of gold coins, I would add to the currency. It is in that way that gold coins would come into circulation.

9902. Your notes would be gold notes?—Not necessarily, for the time being.

9903. Not at first?—I would wait so far as that is concerned. There is no harm in waiting.

9904. Do I understand that you would have a mint, and mint gold bullion into gold coins for passage into currency?—Yes.

9905. And that is the only definite measure you would take at first to provide gold for currency?—Yes.

9906. You would wait for the day in which you could convert rupees into gold?—Yes.

9907. How would you prepare for that day?—By stopping the minting of silver coins and by introducing gold into circulation and when notes are introduced to have a backing of gold. Increase the gold in the reserve, and then your direction must be towards having a currency backed by gold and also gold currency, since there will be a demand for metal in this country. I take it that there will be for a very long time to come a very large number of rupees in circulation, but they must be reduced to real tokens in the course of time. Experience must guide us.

9908. If you open a mint and mint bullion into gold at the new ratio, would you expect very much gold to pass into circulation in substitution for rupees?—That depends, as I told you, Sir, on the leaders of public opinion and the Government, and the education of the people in matters of currency. They were educated recently in respect of notes to a remarkable extent. And I hope also they will be educated in the direction in which I want the currency system to advance.

9909. You have told us that, in order to confront the day when you would undertake the convertibility of the rupee into gold, you would have to strengthen the reserves?—Yes.

9910. What measures would you take to strengthen the reserves, and to what extent do you think the reserves would have to be strengthened?—I would put it in this way. The interest on the securities in the gold standard reserve might be utilised towards replacing silver rupees in circulation by gold. That does not strengthen the reserve but it strengthens the general circulation in the direction of gold currency, and the silver rupees in the reserve might be converted also into gold. And the loss sustained might be met from the interest on securities in the paper currency reserve. These are the forms in which I would have the reserves strengthened. And another method is that when notes are introduced the backing will have to be in the future more largely in gold. These are the methods by which I should like the reserves to be strengthened.

9911. Have you been able to form any estimate as to the extent to which you might ultimately expect to have to convert rupees into gold when you finally announce the convertibility of the rupee into gold?—I have some idea, Sir. Of course, it cannot but be rough. It is in this way. I find that the amount of rupees in circulation is about 232 crores. And you find the paper in circulation is about 190 crores. When you compare that with the pre-war figures of rupees in circulation and notes, you find that our present currency, that is notes and rupees put together, come to about 50 per cent. more. Which corresponds to the increase in prices. And of these 232 crores in circulation of rupees and notes, large masses cannot be presented. I cannot conceive of more than say 100 crores being ever presented. Even if 100 crores are presented for conversion, and 100 crores at the utmost might be presented for conversion, even that I feel is a large figure. So that is the extent to which I feel one could contemplate the amount of conversion that may be called for. It is a very rough estimate, Sir.

9912. If I have understood you aright, you say that you would accumulate the gold to effect that conversion by drawing the interest on the gold standard reserve in India?—Yes.

9913. And you would let the process take so long as is necessary to realise that gold from that source?—It is not the only source, Sir.

9914. What other sources are there?—For instance when there is an expansion of trade, and new currency is required, new currency will flow in the form of gold.

9915. But that is required for addition to the circulation. That would not redeem the hoards. That is new gold against a new note?—Yes. So that the total circulation will more and more be favourable, will contain less and less proportion of silver rupees. In that way the situation will be

advanced in favour of the proposals that I have made.

9916. Then the cost of your suggestion to the exchequer would be the loss of the present realisation of interest on the reserves in aid of revenues?—Yes, Sir.

9917. And its devotion to the unproductive form of gold?—I would not say unproductive.

9918. Well, directly unproductive. It may have its ultimate benefits. That is the direct cost?—Yes.

9919. (*Chairman.*) That is all that I had to ask you in preliminary explanation. Perhaps you will be so kind as to deal with any supplementary questions that any of my colleagues may wish to ask in this matter.

9920. (*Sir Maneckji Dadabhoy.*) Mr. Duraiswami Aiyar, in discussing the question of ratio with the Chairman, you stated that in your opinion there seemed to be no compelling reason for adopting 1s. 6d. Am I to gather from your discussion that the balance of argument is as strong in favour of adopting 1s. 4d. as 1s. 6d.?—That is what I think.

9921. That is, any rate between 1s. 4d. and 1s. 6d. may be selected on the same balance of considerations?—It may be selected if they find that it has the balance of advantage after taking the whole situation into account. I would not try any new rate if it can be avoided.

9922. You have discussed the situation fully and in your opinion the balance of advantage does not preponderate in favour of 1s. 6d.—Yes, you have put my contention properly.

9923. That is your opinion?—Yes.

9924. Speaking about convertibility, am I to understand that you don't advocate a full measure of convertibility at the initial stage?—I would rather wait

9925 How long would you wait?—That depends as I told you, Sir, on the experience of measures that I propose should be undertaken.

9926. Yes, the educational value you speak about or rather the educational turn which you wish to give to the people round about will take some time?—That will take some time, but my main difficulty was the other thing. I am not very much perturbed by that, Sir. My main difficulty is the extent to which in other parts of the world people might care to have gold in the form of currency. I am not quite so sure that the European world is not going to have gold as currency. If I am convinced about that, then I need not be so cautious in the proposals that I have made. That is my main point.

9927. But in India the conditions are so widely different. Will the Indian mind accept the gold standard without some sort of gold currency at the initial stage?—Oh yes. I provide for that. I say that the coining of rupees should be stopped forthwith.

9928. But will that alone be sufficient?—As you have been noticing, in every country there has been an accretion to the circulation of currency from 1900 onwards and I hope, with the recovery of the world to normal conditions, you will find the need for expansion, and that expansion I desire should be in the direction of having gold or notes backed by gold.

9929. That is, accretions to the new currency?—Yes.

9930. But that itself will again take some time?—Time will be taken. But after all, when we gain some experience, we need not thereafter adopt a very slow pace; in the initial stages of course that will be so; but we see that the world is just recovering and we have not yet had the old foreign trade. You will find there has been an increase in the population of the world by 9 per cent. but we have according to the reports received not yet reached the foreign trade level of 1913, so that we are recovering.

9931. Then you advocate the introduction of a gold standard without the statutory obligation of converting rupees into gold?—I would not make it a statutory obligation straightaway; I would rather be cautious. But I would work in that direction, that would be our ultimate aim. I do not mean it would take a very long time. It must come fairly soon, but it all depends on circumstances.

9932. In answer to the Chairman about the adequacy of our resources of gold, you have pointed out that 100 crores may be brought forward for conversion?—Yes, as a rough estimate.

9933. And one of your schemes is that to which you refer in paragraph 33 in which you say, "The interest earned on the gold standard reserve investments and the paper currency reserve may be devoted to replace corresponding amount of rupees in circulation by gold." Will that alone be sufficient?—A number of considerations have to be taken into account, that is not my only recommendation. As I told you, further accretions to currency will take place in the form of gold or notes backed by gold. That alone will go a great way; and when experience teaches certain lessons, when we get to reach normality and see the extent to which gold will come into currency use in different parts of the world, we may adopt a more rapid pace, provided our finances also improve. There are so many considerations to be taken into account, and so I would proceed cautiously by not advocating a statutory convertibility of rupees into gold.

9934. You see when a Commission like this makes a definite recommendation for the adoption of a gold standard, it must have before it some definite and reliable data showing that there will be a sufficient quantity of gold at the initial stages for some years to meet the requirements. Without that it would not be safe to come to some definite decision. Now what is the position. I would like you to enlighten the Commission by your views on the subject—how we shall get over this difficulty of obtaining gold?—I thought when I explained my position I had made my point sufficiently clear.

9935. I have followed so far—from the point of view of accretions to the gold, that the accretion should be gold notes only; now I will put to you a concrete case. Supposing we introduce a gold standard, there is a lot of silver in the hoards at present, a large quantity will be brought forward in the first year or two. How much would be the quantity?—I do not know. But I do not think so personally, unless the monsoons failed; then there would be a provision, and the gold standard reserve would have to be used. But I do not expect a huge quantity of silver to come out. I do not think so, not a huge quantity.

9936. You do not believe then in the theory of hoards?—Not to the extent to which perhaps some others might believe. There are hoards. As a matter of fact I think in the Punjab and the ceded districts of the Madras Presidency when the cotton crop gets a very high price, naturally the peasant tries to keep in the form of a hoard a certain quantity of gold; especially in a country like India where monsoons fail, there must be some sort of provision, and so instinctively he turns to some sort of hoard. There is some sort of hoard, but it would not amount to a very huge sum. That would not be a great difficulty. That is my point.

9937. I would like to draw your attention to paragraph 31 in which you speak about the transfer of the note issue to the Imperial Bank. I cannot exactly understand the purport of that paragraph. Am I to understand when you speak about "the Government being directly associated with it" when the transfer might take place, that you recommend that there should be some sort of provision that the Government should be in touch and supervision and powers of control should be exercised by them and that the Imperial Bank should not be given the sole charge, the sole control of the currency, the note issue?—All my academic training is in favour of the Imperial Bank doing the whole thing, but in respect of the conditions of this country I would

rather proceed slowly. After a certain time it may be that the Imperial Bank will have to do it. As I told you, my prepossessions are in favour of that, but in view of the large place which Government fills in our estimation, I would wait for some time especially in view of the stopping of the minting of rupees and the extended use of gold as currency or of notes backed by gold. Now in these circumstances I would rather wait for some years, say 4 or 5 years.

9938. Then you mean you would not at present transfer the control to the Imperial Bank?—Yes, for 4 or 5 years.

9939. Why not for 4 or 5 years? You think in 4 years' time the Imperial Bank will be more efficient?—I am the last person to attack the efficiency of the Imperial Bank. The whole point is,—you already introduce certain fairly large changes. Taking into account the vast extent of this country, they would be fairly large changes. The proposals that I make with respect to currency involved a striking departure. The Government already manage the paper currency very efficiently to my mind. It has largely increased in circulation; so that I would keep it in the hands of the Government for some time. Not that I am very strong about this recommendation; all my academic training, as I said, is in favour of the Imperial Bank doing it but I would wait for some time.

9940. (*Sir Reginald Mant.*) In paragraph 15 of your memorandum you refer to the fact that the price of silver has not risen to the same extent as the price of commodities have risen, and you point out that there is a possibility of silver rising to the same extent as other commodities and that would constitute a danger to the 1s. 4d. ratio? Later on you recommend the adoption of the 1s. 4d. ratio. How would you get over the danger to which you have referred in paragraph 15 of your memorandum?—As I explained to the Chairman, Sir, there is some difficulty about it. But I feel that if you stop the minting of silver and if further accretions to currency in this country should be in the form of gold or notes backed by gold, the demand for silver is not likely to be as great as it was before the war, and consequently the price of silver is not likely to rise to the level of the price of other commodities. So to that extent the danger is not great; but there is that difficulty as regards that point, that is why I have mentioned it. That is one point in favour of a rate over 1s. 4d. but when once you adopt the method of stopping the minting of silver, the danger becomes very much attenuated because we are departing from the use of silver rupees for currency purposes slowly and steadily,—we are moving on to another line and consequently the danger is not so great.

9941. But do you think that the reduction in the demand from India will have such a large effect on the world price of silver?—A fairly large effect. The Indian demand has not been small.

9942. Would it be sufficient to minimise that danger?—Yes.

9943. There is only one more question. What do you mean exactly by the expression you frequently use, "paper backed by gold"? Do you mean notes convertible into gold?—Yes.

9944. Notes payable in gold on demand?—Yes.

9945. Because you say in your last paragraph that "as a first step we may content ourselves with stopping the minting of rupees and increasing the circulation of gold coins or paper backed by gold." Do you propose then at the outset of your scheme to introduce . . . ?—That I do not mean,—that means the reserve will be strengthened in the direction of gold.

9946. What do you mean there by "paper backed by gold"?—That the reserve is to be in the form of gold; in course of time there ought to be convertibility.

9947. And "paper backed by gold" does not mean notes convertible into gold?—No it does not mean immediate convertibility.

9948. (*Professor Coyajee.*) You observe in paragraph 7:—"But recently it (*i.e.*, internal price stability) has been put forward as something to be maintained as against the stability of the external value of the rupee," and also in paragraph 9, in the last sentence, "The importance of internal price stability is therefore liable to exaggeration." Might not a critic say this, that the internal stabilization of prices is particularly important to India chiefly because the population is poor? You see, the poorer the population, the more they would feel any swing upwards?—I do not think so. Of course it is a question of degree. When prices go up very much, there is then always trouble, it is never healthy for any country; of course small ups and downs of price seem to be inevitable.

9949. I quite agree?—But that is all that is meant there.

9950. Then in paragraph 13 you observe, "The prices of pulses, jowar, ragi, chillies, and similar commodities which are consumed in the main locally will be affected very slowly by a rising rupee." But now there is a connection between the prices of goods entering into international trade and other goods; for instance if the price of wheat falls, then the cultivator will divert his land to ragi and other things?—That is why I say there is a lag; the lag should be made up in course of time; I quite agree.

9951. Then as regards the question of the ratio, I would submit for your consideration one argument which has been put forward for the 1s. 6d. rate. It is said that since the pre-war period a permanent change has taken place in the scale of production of goods in India. That is to say, our cotton mills have largely increased their production, that our production of steel has increased and so on and consequently our imports have tended to become less and our exports continue as they were and therefore the balance of trade is becoming more and more favourable to us as time goes on. That is the argument put forward and I submit it to you for your consideration?—I cannot agree to that.

9952. Because the local production has increased very largely, the imports have fallen and therefore our balance of trade tends to become more and more favourable hence why should not the rate of exchange respond—that is the argument?—I put for your consideration this:—America has increased its production, its favourable balance of trade has grown, therefore why not the dollar be made to contain more gold?—It comes to that.

9953. But the dollar relative to sterling increased very greatly in value?—So that applying the same argument, why should they not put more quantity of gold into the dollar? The argument does not appeal to me.

9954. (*Sir Alexander Murray.*) I think you said to the Chairman that produce of exportable commodities would benefit more than producers of non-exportable commodities by a fall in the rupee?—Yes.

9955. What percentage must be exported to justify a commodity being classified as exportable?—You send them out largely:—Oil seeds, hides and skins, raw cotton and so on.

9956. Let us deal with food grains particularly, because you differentiate between food grains and other things, don't you? What are the food grains that are exported?—Wheat has a world market and so the world prices have more to deal with wheat.

9957. And rice?—Rice to a less extent than wheat, because our total production is so large that this will have a greater effect on world prices than our production of wheat.

9958. In view of the fact that the total wheat crop grown in India is about 10 million tons and

there is only 1 per cent. or 2 per cent. exported, you mean to say this 1 or 2 per cent. will affect the price of the remainder?—It is not that 1 per cent. The whole of the total crop of the world, it is that that affects the price of wheat. It is not a question of 1 per cent. or 2 per cent. which India exports.

9959. That is quite true. But would you say that the exports of a smaller percentage than 1 per cent. affects the price to the consumers in India of the remainder of the crop?—No; that is not what I mean, because it is not right.

9960. What do you actually mean?—I beg your pardon?

9961. What percentage of the crop is to be exported to include it under the category of an exportable crop as against the non-exportable crop?—It is not a question of percentage there. Say things like ragi, chillies, and millets are non-exportable crops.

9962. Will you include jowari and bajri?—No; I would not consider them as exportable crops.

9963. We take it that rice and wheat are exportable crops and that jowari and bajri are non-exportable crops?—Yes.

9964. Now do the prices move differently?—Yes; I would put it this way: that is, those that international prices affect and those which international price levels do not affect to the same extent readily.

9965. In spite of the fact that food stuffs react on each other?—Yes; as I said already there is a time lag. It is all a short period difficulty.

9966. Have you any figures to show that there is a difference in the prices ruling for the exportable commodities as against the non-exportable commodities?—That is very difficult; because it is a question of various factors being taken into account.

9967. In the Labour Gazette, I find figures here giving the price levels of the four articles we were referring to, rice, wheat, jowari and bajri. Taking 100 as the basic price, the index figure in 1914, in October, 1925, rice was 129 points, wheat 124 points, jowari 128, and bajri 130. Now is there anything in these figures to bear out your point that we must defferentiate between the prices of food stuffs that are exported and of those that are not exported?—These figures are not an exhaustive criterion. So many factors enter into the problem. You can only deal with it from a theoretical point of view.

9968. But we are dealing with the actual prices paid for these food stuffs in the country. Don't they give you a fair indication that there is really no difference in the rise and fall of food stuffs whether they are exported or not exported?—It is not exhaustive; it is not conclusive; because the question of supply enters and we do not know about the supply of rice as against the supply of javari or bajri.

9969. I will give you the figures of the total crop?—You know about the outturn figures. In the Taxation Committee they said that outturn figures are not quite reliable and commercial men do not so much depend on them except for jute.

9970. You make the statement that there is a difference between the two sets of food stuffs and I indicate to you from such figures as are available that there is no difference and I produce figures and you simply say that no figures are reliable; but can you not produce anything to support your argument?—I am not wedded to anything here. My theoretical training inclines me to believe that there seems to be some difference.

9971. Then you give some data?—It is not in my power to give. These data must be furnished by other authorities. If they are available then one can weigh and interpret them.

9972. You must have expressed your opinion from some data?—Not exactly. It is not that kind of data. We should have the figures of the supply of crops. I would explain my position in this way. This is a question of commodities entering into international trade and commodities that have a local market. Naturally, the prices of commodities having world market will be adjusted, must be adjusted, to the world price, whereas the prices of commodities which have a local market need not be adjusted so rapidly. Say, for example, the currency of the country is very large in which case, if the world prices fall of the commodities that enter into international trade, the prices of such commodities produced in this country also must fall; but as regards other commodities, this large currency will then tend to keep up the prices of the other commodities.

9973. That is perfectly true; but the point I want some information from you on is this. Do prices of the food stuffs not react on each other to such an extent that ultimately there is really no difference in the price levels between exportable and non-exportable food stuffs?—Ultimately it is true.

9974. And I give you figures relatively to show that between 1914 and October 1925 there is no difference?—There is not very much difference between your point of view and my point of view.

9975. Exchange has been rising for the past three years, 1921-22, 1922-23 and 1923-24. Well now, the exports on the other hand one would have thought would have been affected. But as a matter of fact they have also been rising. The figures of export seem to show that the rise in exchange has not unduly affected exports of rice or wheat or such like commodities from India?—That is quite conceivable. In the period, 1918-19-20, exchange was rising; exports were rising. It is a question of world prices for particular commodities that India produces. Exchange is not the only factor. That is the great point. Monsoons might be favourable. So that one can conceive that kind of correspondence. Other things remaining the same, it will be affected. But other things do not remain the same. Monsoons have been favourable. If world conditions are favourable, then with the increase in exchange there should also be increase in exports as was the case in the period from 1917 to 1920.

9976. In paragraph 22, you refer to index numbers of wholesale prices during the period from October 1924 to August 1925. You refer to the prices ruling in the United Kingdom and those ruling in India. Now I have taken out here the prices of those countries that have run on to the gold standard, namely, the United Kingdom, the United States of America, Canada, Netherlands, Sweden. In 1924 India was roughly at least 20 points higher than the average of the wholesale price level of those other countries. In August 1925, that is the month you have taken, India is practically in line with all these other countries round about 160. There are six gold standard or exchange standard countries with a price level at the same figure. What does that suggest to you, Mr. Aiyar?—I will put it in this way. Between 1900 and 1914 there was gold standard obtaining in different countries; but the rise in prices was different in different countries; so that you can conceive of the standard remaining the same, yet price levels rising differently in different countries. The use and abuse of index numbers, that is an important point. The way in which index numbers are compiled in different countries, the commodities that enter into this preparation, the extent to which the commodities enter into the world trade or have a local market, all these make me rather be very careful in the matter of arguing from index numbers. It is some sort of guide; but we cannot swear by index numbers especially where small changes are concerned.

9977. It is a coincidence, to say the least of it, that all these countries have their index levels at almost exactly the same figure. Would that not suggest to you that it is a suitable time to stabilise

at 1s. 6d.?—That itself may tell me that when all those countries which had returned to their old gold parity maintain 160 and India also maintains 160, 1s. 4d. the old parity is more appropriate. That shows that there has been a lack of adjustment of the price level and therefore one must be more anxious about it.

9978. If India had 1s. 4d., then the price level would not be 160? It is the fact that it has 1s. 6d. and that the price level is 160?—I won't dogmatise on that for the reason that I have already mentioned.

9979. (*Chairman.*) Is there anything on which you care to supplement any matters which we have dealt with to-day?—Nothing in particular.

9980. (*Chairman.*) The Commission is very much obliged to you for your memorandum and for your attendance here to-day.

(*The witness withdrew.*)

TWENTY-SIXTH DAY.

Wednesday, January 6th, 1926.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman.*)

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER, } (*Secretaries.*)
Mr. A. AYANGAR, }

The Hon. Sir BASIL P. BLACKETT, K.C.B., K.C.S.I., recalled and further examined.

9981. (*Chairman.*) Sir Basil Blackett, you have been good enough to travel from Delhi in order to give us a further opportunity of obtaining the benefit of your assistance before we conclude our sittings in India. It is not our intention to occupy your time with any formal repetition of all the matters we went into so fully at our Delhi sittings, but we all feel that there are various new matters, new considerations, which have come to light in the course of the evidence which we have received at Bombay and at Calcutta, about which it would be very useful to us to have the benefit of your opinion. In the first place, during the previous evidence which we received from you, the greater part of our attention was devoted to the discussion of proposals for a gold currency and a full gold standard, and it appears to me that it would be very useful that we should go in a little more detail into alternative proposals for some form of an exchange standard in order that we may be sure that we have ascertained to the full what your opinions and recommendations are about that alternative. Let me ask, in the first place, a general question, and that is what, in your opinion, are the essential qualities or characteristics which we should seek to obtain in designing any reforms in the Indian currency system?—May I preface my reply in the same way as before by repeating that I do not speak on behalf of the Government of India; by way of precaution I think it best to mention that. The two essential desiderata in any reform of the currency system of India should be that the Indian people should have full confidence in their currency and that the system should be reasonably intelligible to them. Simplicity and confidence would be my two desiderata.

9982. And confidence, no doubt, results from simplicity and intelligibility as much as from anything else?—The two go together, yes.

9983. In the past we have reason to suppose that confidence has not been felt in the pre-war system, but, on the contrary, there was a certain amount of suspicion with regard to that system. What were the reasons for that?—I think the defects of the pre-war currency system have been greatly exaggerated. It is largely a question of psychology. There has been a widespead feeling that in some obscure way forces are always at work to manipulate anything but a gold standard to the disadvantage of India. It is a feeling which I think is entirely devoid of foundation but is all the more difficult to counter for that reason. I think that the suspicion felt in regard to the pre-war system was in large measure duo to the fact that the system was complicated, not easy to understand or explain, and was open to misrepresentation. The common ground of attack was that it was a manipulated system, a managed or a manipulated system. Of course the unfortunate history of the reverse councils in 1920, when there certainly was perhaps one may say some mismanagement, has increased the suspicion, and I think the primary demand of India in consequence is for a system which is not capable of manipulation.

9984. Is any currency system wholly free from an element of manipulation?—Every currency system is in a sense a manipulated system or at any rate, to use a more neutral word, a managed system. You will see that in the attacks on the discount and credit policy of the Bank of England at the present time or the Federal Reserve Board. There is a public at any rate there, which clearly recognises

that the British and American system are managed systems; but at the same time it is possible I think and certainly desirable if possible and I should say it is essential in order to establish confidence to make the Indian system automatic.

9985. I understand that any currency system that is known is, in a sense, a managed or manipulated system in so far as discretion is exercised in the control of credit through the discount rate?—Yes.

9986. And, to some extent, in so far as there is any opportunity of a discretion or of legality in the maintenance of the appointed proportion of reserves either to actual currency or to deposits?—Yes, an automatic system carries with it its own danger signals, but if they are disregarded by those who are responsible for the credit and discount policy the system fails to work, and it is just as much manipulated if it goes wrong because the discount policy is wrong as if it goes wrong because the actual management has been wrong and additions to the currency have been too easily made.

9987. In India we have the characteristic condition that, owing to the nature of the civilisation of the country, the discount policy is still a matter of less direct moment than it is in Western Europe?—I doubt if that is entirely the fact. It has loomed less large in the consideration of currency questions but I believe that it is the kernel of the matter in India just as much as in any other country.

9988. You arrive at the conclusion, then, that the Indian system must remain as free as possible from the element of manipulation?—Yes.

9989. I am now discussing the alternative to the gold standard of an exchange standard of some sort at the present time, and in order to cover that ground fully I should like to ask you, on that assumption, what measures you would recommend to that end of freeing the system from the element of manipulation?—The assumption, I understand, is that for some reason the gold standard is regarded as impracticable. I think there are two important points. One is the fixation by statute of gold import and export points; the other is the amalgamation of the reserves, the gold standard and the paper currency reserves, the whole being managed by the Imperial Bank of India with statutory provisions regarding the reserves to be held. I think whatever the system adopted, whether it is a sterling exchange standard or any other standard, the fixation by statute of gold import and export points makes the currency as automatic as any other currency system in the world.

9990. The measures that you recommend are four in number, are they not; the fixation by statute of the import and export points; the amalgamation of the reserves; the transfer to the Imperial Bank of the control of the paper currency; and statutory provisions regarding the reserves to be held?—Yes, they can be separated into four.

9991. After the adoption of those measures, expansion and contraction would then depend upon natural forces and the discount rate?—Provided that the discount policy was properly managed expansion and contraction would happen automatically and the exchange would vary within the gold points in accordance with seasons and state of trade and so on. So long as the dicount policy was properly managed there could be no variation except within the fixed points.

9992. What defects would then remain in the system?—I would say the two defects mentioned in my previous evidence are the main ones. Assuming it was a sterling exchange standard there would be no provision against the possibility of sterling being divorced from gold again.

9993. There would be that possibility?—There would be that possibilty: and the other is that so long as the rupee is unlimited legal tender there is no protection in the system at that stage against the possibility of silver rising above 48d. Once silver does that, if the rupee remains unlimited legal tender, it would automatically become a silver standard.

9994. Taking those two defects in order, can you make any suggestion in order to deal with the first defect, that is the defect of the possibility of the divorce between gold and sterling?—Yes; that can be remedied fairly simply, though it involves a certain amount of cumbersomeness, by fixing the import and export points by statute with reference, not to sterling only, but to gold standard countries generally on the lines indicated in the memorandum by Mr. Denning on the subject of, I think, Transfer of Paper Currency. That would bring India really absolutely into line with the currency system now in force in England and those countries in Europe which have restored their currencies to the gold standard. They call it a gold standard, but in point of fact it is really an international exchange standard.

9995. Just one question before we pass on to that. I understand that the actual mechanism would be that the currency authority, instead of selling sterling only, would sell the currency of any recognised gold standard country?—It would be under a statutory obligation to do so, at any rate, on at least one other gold standard country besides England under this proposal. It would be possible, I think; at least I have never seen a satisfactory scheme, but I would like to see some arrangement by which instead of undertaking to sell exchange on a gold standard country it gave gold for export, provided it was perfectly clear that the gold was for export.

9996. May I leave that for a moment because I want to explore the first suggestion. If you undertake to sell the currency, say, of two gold standard countries, I suppose theoretically if both those countries wandered from gold you would be under the same disadvantage as you were at first?—Yes I suppose you would; and of course it is always a probably contingency that if sterling goes off gold any other currency equally would go off gold also.

9997. It might be said that the same shock which would shake sterling away from gold would shake almost any currency away from gold, with the possible exception of the United States?—Yes, it would depend upon where the trouble arose; and you might have the reverse position that the United States was shaken off the gold standard and England would be one of the few countries that was enabled to stay there.

9998. So that, by increasing the number of foreign currencies which you sell against the internal currency, you are only increasing your practical guarantee of its being a gold standard, and not making an absolute theoretically impregnable defence?—I contemplate that the statutory provision would be that at least one other currency besides sterling must always be specified for the Imperial Bank as a currency in which it must be willing to buy and sell at a fixed rate, and it would be within the competence of the authorities at any time to add other currencies to that list or to take currencies away from that list, so that if you had the position that both sterling and the second currency which had normally been used were off the gold point, the authorities would then have the duty of fixing some other currency which had remained at the gold point.

9999. The authority would be free to pursue the currency which managed to maintain its parity with gold?—Yes.

10,000 You tell us that this scheme which you have outlined would bring the Indian currency into line with those of Great Britain and the other countries which are now on a so-called gold standard?—It would, subject to the question, which perhaps can be dealt with separately, the position of the over-valued rupee; and subject to this other exception that at the present time in the other countries which have adopted an international exchange standard,

gold is given for internal purposes by the currency authorities, in some cases gold coin and in all cases gold bullion; the central reserve is liable to pay out gold bullion on presentation of internal currency, and it is not I assume contemplated under any exchange standard that that would be done in India, because that is really the kernel of the proposal made in regard to the gold standard, and the assumption is that this is not a gold standard.

10,001. But, as a matter of fact, in all other countries of importance from the point of view of the currency system, gold is not used in circulation?—No; all the advanced countries of the world have given up gold for circulation; but gold bullion is given for internal purposes from the central reserve in theory; in practice gold is obtained only to a very small extent, if at all, from the central reserves, and is purchased in the market in the ordinary way, just in the same way as India purchases gold in the market.

10,002. Referring to the system of Great Britain, all that can be obtained there is the minimum quantity of gold bars, very little for internal use?—Of course you can get 400 fine ounces, I think that is the amount of gold in exchange for internal currency. Now that can be obtained otherwise than for export as I believe is the case since the 1st January. It is always possible for people who want gold for the arts and for the wholesale dealer in gold so to speak, to obtain it from the central reserve and to sell it in smaller quantities to his customers; but in practice it is nearly always as cheap or cheaper to obtain gold in the market rather than from the Bank of England.

10,003. Under such a scheme as has been outlined, would there be any difficulty on the part of the Indian public in obtaining the gold required for the arts and for purposes of female adornment and so forth?—No more difficulty than there is at present, that is to say, none. At present India can get all the gold she wants in the open market at the ordinary market price. India is under no disability at the present time as compared with any other country in the matter of obtaining gold for internal purposes. It can obtain it in the open market by using its internal currency in order to buy foreign exchange and using the foreign exchange in order to buy gold, and it is really in exactly the same position as regards obtaining gold as any one in any international exchange standard country.

10,004. Silver hoards would come out to be replaced by gold?—It could be done even now; it is just as possible now; the holder of a silver hoard would be equally able to do it under the proposed gold standard arrangement if he wants to do it.

10,005. But we should still be left, should we not, with the complication of a silver note and the convertibility of the paper note into the silver rupee distinguishing the Indian system from other systems?—Generally speaking in the other international exchange systems the only unlimited legal tender is the paper note, inconvertible for internal purposes, but made absolutely convertible into foreign exchange by the currency law. There are as a matter of fact some exceptions; one was I think mentioned by me when I was giving evidence before, namely, the five-franc silver piece in France; and perhaps more important is the silver dollar in the United States; there is a limited number of silver dollars in the United States which are not being added to; they are absolutely full unlimited legal tender which circulates mainly, not in the form of the silver dollar, but in the form of the silver note based on the silver dollar in the treasury; but subject to that the normal arrangement in other countries is that paper is inconvertible for internal purposes, but absolutely convertible for purposes of external payments. In India in addition to the paper note there is in circulation the silver rupee with unlimited legal tender privileges and in addition the paper notes in India are convertible into silver rupees. This has always seemed to me to be the root of most of the difficulties and most of the complications of the Indian currency system.

10,006. If that be so, if we are left with those remaining difficulties and complications, is there, in your opinion, any manner in which they can be remedied?—In my opinion (I gave it last time) the only easy method by which this defect can be got rid of is by making the paper currency of India convertible into some other metallic currency, that is to say, into gold, and eventually taking away the legal tender privileges of the silver rupee. But that involves the adoption of the gold standard, and I gather that the question put to me is what alternative is there which I would advocate if the gold standard is for any reason found not to be possible.

10,007. We understand from your previous evidence that, in your opinion, the most, and indeed perhaps the only, satisfactory method of remedying these defects in the Indian system is by making the rupee first of all convertible into gold and finally dethroning it from the position of unlimited legal tender?—Yes; I advocated the adoption of a gold standard with a certain amount of gold in circulation and the internal currency absolutely convertible into gold; but I advocated it only as a necessary step in my view in the direction of the still more ideal form of currency, namely, an international exchange standard by which I mean a paper currency inconvertible internally, but freely convertible on a gold basis for external purposes. The view I put forward was that it was necessary for India to pass through this intermediate stage of having gold in circulation although it is a wasteful and expensive system in order to arrive eventually at the more perfect one and I advocated it because I believed and believe that the gold standard would inspire confidence and would provide the stimulus which is so badly needed for investment and the banking habit.

10,008. That was your original evidence which we have in mind. In order to explore the possibilities of an exchange standard, assuming for the purposes of discussion that a gold standard is not to be had, the question then arises, could anything, and, if so, what, be done to remedy this element of difficulty and complication due to the double form of note, the paper note and the silver note?—Since I gave evidence last time my attention has been called to one plan for obviating the difficulty which has in my view very considerable attractions always assuming that the gold standard itself is not available. The difficulty is that if silver rises above 48d. and the silver rupee remains unlimited legal tender, the exchange standard becomes deranged in India so that I would make it as an additional proposal that the right of the holder of the note to obtain payment in silver rupees should be taken away or rather that the existing notes should gradually be replaced by notes which did not carry this right of conversion into silver rupees. I would suggest that the Government of India should cease to coin rupees, that there should be, in place of the existing notes which are a promise to pay so many rupees, a note like the English note which is a piece of paper representing ten shillings or one pound. In the same way you might have a piece of paper representing so many rupees, 10, 5, 100 rupees, which would not have the legal privilege of conversion into silver rupees. The holder of such a note would under this proposal have the absolute right of obtaining international currency at par for his note, but he would not have the legal right to get it changed into silver rupees.

10,009. The note would then be on precisely the same basis as the British note?—Exactly the same. It would be a piece of paper representing so many rupees.

10,010. How would this work out in practice? I imagine that there would be no immediate difference to the holder of the note?—No, I think the holder of a note would really be for practical purposes in the same position as he is now. So long as there was a large surplus of silver rupees as we have at present, there would be no difficulty whatever in giving the

holder of the note change, in giving him silver rupees for his notes; the Banks would give him silver rupees for his notes as a matter of ordinary practice, and he would get notes or rupees whichever kind of currency he wanted entirely according to his own preference. I contemplate that the transition from Government notes convertible into silver rupees to Imperial Bank notes not so convertible would be a gradual process which would take several years, a good many years altogether, but the main transfer would take several years and the two kinds of notes would for a long time be in circulation side by side and interchangeable, and the holder of either kind of note would in practice have obtained silver rupees for them whenever he wanted. The position would be fully established before the new note had entirely replaced the old one. Meanwhile the obligation on the currency authorities to give silver rupees would have disappeared, and the note would be no longer a promise to pay rupees but simply a piece of paper representing a certain number of rupees, inconvertible internally but absolutely convertible for external purposes.

10,011. Then the holder of the note would find no practical difficulty in obtaining rupees against his note, although it is no longer legally convertible into rupees, until the cessation of the coinage of rupees, coupled with the natural absorption of rupees, had substantially reduced the number of rupees outstanding, which would be a long period?—We have of course a surplus at the present moment of 90 crores of silver rupees in our reserves, and there does not seem to be any great probability that we should run short of rupees at any rate till towards the end of the next decade, that is to say not for nearly 10 years if not for more.

10,012. Do you propose that the 90 crores should gradually pass into circulation?—Yes, that would be the suggestion.

10,013. The cessation of coinage would not imply a cessation of issue?—Certainly not.

10,014. Would you alter the position of the silver rupee in circulation at all?—It would be unlimited legal tender for the time being but the holder of a note would no longer have the right to obtain rupees for it although the rupee and the note would be unlimited legal tender.

10,015. Then as, on the one hand, this proposal would make no immediate practical difference, so, on the other hand, it would provide no immediate practical remedy for the complications of the system?—I think it would provide a very considerable remedy, not perhaps a complete remedy, for the complications of the system, but it would I think provide a very useful remedy against the contingency of silver going above 48d. because if the contingency arose in India, in which the bullion value of the rupee was greater than its currency value, it would be a simple enough mattter to print off one rupee notes and allow the silver rupees to be melted down.

10,016. The difficulty now being that you must have rupees to provide for the right of conversion into rupees?—There is the promise to the holders of all the notes now out that you will give them silver rupees when they ask for them. Therefore so long as those notes are in existence you must have rupees to give them. But if the notes in circulation were no longer a promise to pay rupees, it would no longer be necessary for you in an emergency to provide silver rupees with which to meet that obligation and you could provide one rupee notes which for purposes of actual circulation would be equally useful with one rupee coins.

10,017. I understand that, as an incident of this proposal, you would restore the one rupee note into circulation?—Yes, I would restore it, possibly not immediately, but fairly soon, at any rate as soon as there began to be any considerable fall in our present holding of silver rupees. I would be inclined to suggest also that when you did get that, you should make the one rupee limited legal tender for Rs. 50 only, not give it unlimited legal tender privileges with the silver rupee or the bigger note.

10,018. What would be the object of that proposal?—It would accustom the people to Rs. 1 being limited legal tender and might eventually lead on to a position of affairs when you could possibly recoin your rupee with a smaller silver content or possibly make it of some other metal such as aluminium and take away the legal tender privilege.

10,019. Might it not be said, on the other hand, that if you desire to encourage the use of the small note in circulation, it is most important that there should be no impression created that there is any difference in status between the one rupee note and the silver rupee?—It might be desirable I think to experiment and see whether the limitation of the legal tender privilege of the one rupee note really would in practice have any effect. If you found that it militated against success, then perhaps you could restore its legal tender privilege.

10,020. In considering the possible criticisms of this last proposal, that is the policy of inconvertibility of the note into the silver rupee, what answer should be given to a point of view, were it advanced, that in view of the habits of the Indian people and the degree of civilization to which the uninstructed have attained, it is essential that there should be some metallic coin in circulation?—Of course there would still be a metallic coin in circulation, namely, the silver rupee.

10,021. Then let me put it in another way, that it is essential that the note should be convertible into some metallic coin for circulation?—That is a view which of course has been held strongly and was held quite strongly in 1917 when the question of obtaining silver with which to maintain the convertibility of the rupee at that date was an acute one. But as I said last time there has been a great deal of education in the matter of currency all over the world in war and post-war period, and from such information as I have been able to obtain by asking questions on this point, it does not seem to be thought that there would necessarily be any very great difficulty in maintaining a note of this sort in circulation. What one proposes is that the Imperial Bank should take over the currency, should start replacing the present Government of India notes by Imperial bank notes, but these notes would be not promises by the Imperial Bank to pay but notes representing particular amounts of rupees; and if the one change, namely the substitution of the Imperial Bank note for the Government of India note passed without comment, one would expect that the other might pass equally; it would be a matter of experience to some extent during the period when both notes were circulating side by side whether there was any definite dislike of the new note as compared with the old.

10,022. We have understood from your evidence on previous occasions that, in your opinion, the fact that this note was a Bank note would not create a disturbance in the public mind?—That is the impression that I have received from such inquiry as was possible on a subject of that sort. It is not a matter of course on which one can be absolutely dogmatic.

10,023. I imagine you would attach importance in connection with this proposal that the note should no longer be convertible into rupees, to the circumstance that no actual difficulty in obtaining rupees for notes would be likely to develop for a long period of time?—There should be no great difficulty in obtaining rupees for notes just as there is no difficulty in obtaining shillings and half crowns in England for 10 shillings and one pound notes. There is no legal obligation on anybody to give change for a pound note and the same would be the position here. There would be no legal obligation on anybody to give rupees in exchange for a rupee note. But in practice, every Bank would be bound to do so in its own interest and everybody would, in practice be, as I said before, as well able to obtain rupees

as he is now; and of course, the change will also be coincident with the introduction of a provision making the rupoe note absolutely convertible into international exchange.

10,024. You have told us the outlinos of an exchange system, and I should now like to ask you a goneral question. What in your opinion, would be tho offect of such a system upon the public mind in inspiring that confidence which is, you told us, inspired by the simplicity and intelligibility of a system?—It would, I think, be a vory much simpler and more intelligible system than the present one. It might not seem to be so at first sight. But thore would not be the complication of the silver rupee. The position would be that the currency would consist of paper notes and silvor rupees, absolutely convertible into international currency at the will of the holders, with one single curroncy reserve, management of the currency entirely in the hands of the Imperial Bank, neither the Government nor the Imperial Bank having then any power to add to the currency at will, the systom absolutely automatic, parity with gold established by statute and a managed system only in the sense in which the United States or English systems aro managed. I think it will be a system which would be capable of being explained and boing made intelligible to poople of ordinary intelligonce. It would not be so complicated as the present system. I have already said that I don't think, at least I would say that I don't think that it would inspire such complete confidence as a gold standard with the currency convertible into gold coin, so that it would not create immediately that stimulus for tho investing and banking habits which I look for from the gold standard; but if it was introducod in propitious circumstances with good will all round, I believe that it would create confidence such as does not exist or has not perhaps existed in recent times.

10,025. Two further questions before we leave the subject of the exchange standard. Assuming some such system as that we have now been discussing, are you in favour of adding to that a provision making gold coin legal tender and available through a mint?—I don't see what purpose will be served by doing so. It would only complicate the position. In my viow, the only purpose of a gold coin, the only usefulness of having a gold coin in circulation is if the currency is convertible into that gold coin: that does give confidonce; but that involves a gold standard with gold in circulation. If gold has merely an optional circulation, I don't see the object of introducing a gold coin. It seems to me to be a mere embroidery of the system without gaining any advantage for India. It is an unnecessary and wastoful way of using gold. There is strong argument in my opinion for giving a gold coin to India if you make the rest of her curroncy convertible into gold coin. But I don't regard the gold standard with gold in circulation as the ideal. I regard tho international exchange standard as the ideal and if you come to the conclusion that for one reason or another, the immediate or the early introduction of the gold standard is not possible, I would suggest that the proper course is to tell India so, explain the reasons why it is not possible and mako an effort then to get immediately on to the ideal system, namoly, the international exchange standard. I do not soe why if you are going to give India the international exchange systom, you should try to disguise that fact by putting gold into circulation optionally. I do not think camouflaging is the way to inspire confidence.

10,026. I undorstand that, in your opinion, in so far as you had gold in circulation, that would be an expense, a locking up of a value which might be better employed?—Yes.

10,027. And also, in so far as gold might replace notes in circulation, it would make your currency less elastic?—I should not expect the gold to replace notes to any large extent if you had as the gold coin a 20 rupees mohur as has been suggosted; but in so far as it goes into active circulation, it does to some extont roduce the reservo—I am distinguishing again between circulation and hoards, and in so far as it replaces notes, it does make the currency system loss olastic.

10,028. Now might I put an opposite point of view? Assuming it as definitely announced that the policy is an exchange standard, accepting what you say there as to the dosirability of a definito announcomont, and recognising that the difficulty of such a standard may be that at first it does not inspire confidence, would it have any appreciable effect in incroasing confidence in the exchange standard if it were soon, as it were, that gold coins and rupees actually circulate at a stable definite relation in value?—I should say no. I think it would make the international exchange standard more intelligible, make it look better in India if you could arrange for gold to be given for export in the same manner as it is done in other countries, if it were not confined to the German system of giving foroign exchange only. But I do not see the object of putting a gold coin into circulation or of any attempt to camouflago the international exchange system. I see quite a disadvantage if I may say quite frankly, what I have in mind. Ono Commission after another has sat and has suggested that India has got a very good currency system but one day she may have a better system; and moanwhile you adorn the existing system by allowing a certain amount of gold in circulation. India has been told that there is a better system and she has boen told that things like gold currency in circulation and a gold mint are part of that better system which has been denied her. But in my view, if you gave her the international exchange standard, then, as I have suggested, you would be giving her something bettter than a gold standard; and why should you try to dress up the better in order to make it look like the worse, which is really what you are doing, I mean, if you add gold currency which has nothing to do with the system. I assume that the Commission would be in this position, that it had come to the conclusion that whatever the advantages of the gold standard there were praotical difficulties for putting it into operation at an early date, these practical difficulties would be explained as not being obstacles deliberately put in the way of India by interested parties in the world, obstacles for preventing India from getting something that would be good for India, but obstacles of a kind that would involve the creation of a disturbance in the world which must inevitably react disastrously on India hersolf, so that it would be contrary to India's interests to attempt the transition to a gold standard. India would by trying to force the position therefore not be only causing disequilibrium throughout the world but an upset in her own prices, a very considerable fall in prices and a further impediment to the development of India industrially and economically; and that being so, she would make an attempt to get away from the intermediate stage of the gold standard and go to the final stage of the international exchange standard; and if the Commission came to that conclusion and stated that position clearly, I do not see why thev should not go on to say "as we cannot give the gold standard, and as it is not so good any how as the international exchange standard ultimately, we do not propose to add a gold mint and gold in circulation in order that a few people may like to look at it."

10,029. Perhaps the argument might be put rather more strongly in favour of such proposal as a proposal which might have a valuable influence in making it possible for the people to accept an exchange standard. There, again, the idea would be that it would inspire confidence (a confidence which is essential in order to enable the system to be

adopted and worked) in an exchange standard if the man in the street were to see, that, when he goes to a shop with ten rupees or a ten rupee gold mohur, he gets the same amount of goods for them, and it would create a more visible link between his internal country and gold in contrast to the link with foreign currency which is by no means visible?—I suppose it is ultimately a question of psychology; but it does seem to me that there is everything to be gained by being frank and honest and saying quite clearly that there is nothing in this idea of having a gold coin for its own sake; it is merely a pandering to a diseased craving for something that is of no use to anybody, and I believe that confidence is more likely to be created by frankness that by any kind of pretence.

10,030. I think I do quite follow you. You say that, in order to educate people, it is unwise to distract their attention from the real basis of their currency?—Yes, that I think puts it very well.

10,031. Before we leave the subject of the exchange standard, might I ask you to expand a little a matter to which we have twice referred, and that is the possibility that the obligation upon which the stability of the rupee under an exchange standard is based is not the obligation to buy and sell foreign currencies but a similar obligation to that now undertaken by the Bank of England to sell gold, but in the case of India to sell gold for export only. I rather gather that you have looked upon that as a practicable suggestion?—I have tried to explore it several times but I have always come up against the difficulty that it seems extraordinarily difficult to work it in practice. You undertake to give gold in exchange for internal currency but only for export. Now what is export? I referred I think last time to the possibility of export to a port in Kathiawar. That obviously is an obligation which you could not undertake because if you undertake that obligation you might as well undertake the whole obligation that was suggested in the proposals regarding the gold standard system and give gold for internal purposes, give gold bullion for any purpose. That is objected to as involving world difficulties I understand, or at any rate, that is the assumption on which we are speaking to-day.

10,032. At present?—I have not seen any practical plan for ensuring that gold shall be given only for legitimate export and not for any other purpose. I do not see how it would work. If it involves a system of license it becomes rather cumbrous. You might make the Imperial Bank itself do the export. But if I could see a practical plan worked out I should be in favour of it.

10,033. Two suggestions might be made, the first that to which you have just referred, that the Imperial Bank should itself act as the agent for the exporter in making the export; the second that it should be required that the Imperial Bank should satisfy itself that the gold was actually going to some place where it would serve as a medium for clearing an international payment and serving its purpose of supporting the exchange?—In point of fact I suppose it would be an obligation which would very rarely come into practice because even if exchange were at or near the export gold point the Imperial Bank would probably find it more convenient on every ground to sell foreign exchange and take payment in internal exchange rather than to give gold, and it would so arrange it that it was always cheaper for the man who wanted foreign exchange to buy it from the Imperial Bank in the form of foreign currency rather than in tho form of gold.

10,034. Light is thrown upon that, is it not, by the experience of countries which are actually working that system, Great Britain for example, where gold shipments are comparatively rare events?—Great Britain is rather an exceptional case. In Great Britain gold shipments are the rule rather than the exception. Well not quite that; but they are taking place all the time. I imagine in India for some time to come the actual export of gold will be a rare event. A poor monsoon would have the effect rather of reducing the net imports of gold than of leading to an actual export.

10,035. You think, in short, that the actual export would be, as you tell us, a rare event in the cycle of Indian trade?—Yes that must be so in a country which is normally a large importer of gold, which normally covers a considerable portion of its balance by means of importing gold.

10,036. Do you see any advantage in the suggestion of making a more visible and more readily understood link between the internal currency of the country and gold?—Yes I think it adds to the intelligibility and simplicity of the system.

10,037. Perhaps we can carry it no further than saying it makes it worth while to explore the practical possibility of the idea. That is rather a matter for practical banking experience?—I should be glad to explore the matter further if the Commission so desire but it is very largely a physical question for the Imperial Bank authorities whether they could do it effectively.

10,038. Let us put it, then, in this way, that you would do it if you were sure it could be done?—Yes.

10,039. (*Chairman.*) That completes the questions I wanted to ask on the assumption of an exchange standard. Now I want to turn round our point of view and assume that a gold currency is essential as a step towards the ultimate goal of an inconvertible gold currency, and my next question will be directed to that point.

10,040. (*Sir Purshotamdas Thakurdas.*) May I, Sir, ask you to follow the same practice as you followed in Delhi? This is a self-contained part of the examination and we might ask supplementary questions on that before you proceed to the second part.

10,041. (*Chairman.*) Yes, I think it is fairly self-contained. It may be more convenient to take supplementary questions step by step. The subject falls into two heads fairly well.

10,042. (*Sir Purshotamdas Thakurdas.*) I have only made a suggestion; it is for you to decide.

10,043. (*Chairman.*) I just want to see if there is any likelihood of referring backward and forward later on, in which case it would be more convenient to go straight on, but I do not think it is more convenient. Let us take supplementary questions upon the first assumption at this point. We are taking questions now with the object of clearing up any points which have still to be cleared up upon the basis of an exchange standard.

10,044. (*Sir Alexander Murray.*) What was the last point you were discussing, Sir?

10,045. (*Chairman.*) The last point of discussion was as to whether the obligation in support of an exchange standard should be to buy and sell foreign currencies or to buy and sell gold.

10,046. (*Sir Alexander Murray.*) Quite so. The one question I wish to ask arises out of a remark made by Sir Basil Blackett when he was referring to the possibility of any disaster which would divorce sterling from the gold standard that it might possibly also knock off other countries and he referred in particular to the possibility of even knocking the United States of America off the gold standard?—Yes.

10,047. Well has Sir Basil Blackett in view that something of that description might happen?—I have nothing in view but if the United States found herself involved in a war on a very big scale in which the British Empire was not participating, you might very likely have some corresponding position to that which you had towards the end of this war. It is not a thing that one can really foresee but after the experience of this last war it is equally as conceivable as the present position would have been in 1910.

10,048. (*Mr. Preston.*) With regard to the physical difficulty which you mention in connection with the shipment of gold from hero to ensure that it was meant for actual export to overseas countries for the

purpose of supporting exchange, have we not got a parallel case in view with regard to the manner in which Government deal with opium to-day. Government actually ship the opium, do they not, still?—Yes but the position is not that Government are shipping out of India a commodity for which there is normally a large demand in India in excess of the internal supply. This is a case of shipping out of India gold when the normal position of India is an annual import of a very considerable amount.

10,049. But is not the main object the Government of India have in view in regard to opium is to see that there is no chance whatever of its getting back into this country?—Yes, that is true.

10,050. What I mean is that in so far as the Imperial Bank goes or Government itself, there is no difficulty whatever. The trouble is infinitesimal, in the physical feature of actually shipping the gold putting it on board the steamer and getting a bill of lading so that the authorities could be absolutely sure that the gold being shipped is for a genuine purpose?—The word "physical" was not meant to imply the difficulty of carrying gold on board the ship.

10,051. Quite so. Then with regard to the proposed change in the note circulation, would it not be possible, when the contemplated change was made of handing it over to the Imperial Bank, that all the new notes should be made as mohur notes, and it was distinctly understood that those notes represented gold for export purposes only, and that they could be converted into gold for export purposes only. Would that not also assist?—It might possibly assist perhaps if your ten rupee note had on it not only 10 rupees but half a gold mohur.

10,052. It would be a distinctive note and Government could issue a notification to the effect that these new issue of notes, mohur notes we may call them for the time-being for the sake of argument, shall not be convertible into gold for internal purposes, but shall be convertible into gold for export purposes only?—That is the suggestion I made. Your suggestion I understand is that the note should bear on the face of it some indication of the special facility for obtaining gold for export. It is well worth exploring.

10,053. That would almost do away in a measure with any undertaking from Government to sell gold for export?—No I don't think you could put on the note some sort of claim to get gold and then take away the obligation of giving it.

10,054. No, what I mean is supposing an individual has a lakh of mohur notes; he has the right to demand a lakh of mohurs for export?—Yes, but that would not take away from the Imperial Bank the obligation of giving gold when asked for.

10,055. We will assume the case of a bank desiring to export a fixed amount of a lakh of gold. They deliver a lakh of mohur notes. There will be no object in the bank going to Government as we do in England and buying gold at the statutory price from them when we can exchange the mohur notes into its equivalent in gold?—I think I agree.

10,056. It is part of the same process, is it not?—I think so.

10,057. What would be your opinion with regard to a silver currency? Are you of opinion that at this juncture, or when the Commission definitely gives its decision, that any great disturbance would be caused in India if a suggestion were made that the rupees might be considered legal tender up to, take for argument's sake, Rs. 200 as against notes, but for a period we will say of five or ten years the rupee would be freely received by Government for rents and customs and such dues, but that as between private individuals it should be only limited legal tender for 200 rupees?—I think that change would have to be introduced rather gradually.

10,058. I was making the reservation that for Government dues and customs Government would receive it freely, but as between individuals in private transactions, there should be a limited legal tender of Rs. 200: and in making that suggestion it occured to me that that might be the first step in ultimately leading up to a limitation to be placed upon rupee transactions: it would cause little or no disturbance?—I am inclined to think it would, because considerable disturbance would be introduced by itself in that form.

10,059. You think it may be dangerous?—Yes; and I think one of its effects would undoubtedly be that it would make those people who are hoarding silver rupees demand gold for them.

10,060. Yes, but then we would have them in this position that they would not be able to demand because they would come under this legal tender of 200 rupees?—They would not have the right to get gold from Government unless you introduce the gold standard; but they would take steps to convert their hoards into gold, as they can do freely enough in the market; and they would by that process, I think, have created that sudden demand for gold on the market which it is one of the assumptions of this discussion would be so undesirable as to make the gold standard itself undesirable for the moment; I think thereby you would create that very demand, that very large and sudden demand, that you are trying to avoid.

10,061. (*Mr. Preston.*) But would it be an unmixed blessing for us to begin with if we could to tap these hoards of hidden rupees, because in the ultimate result, if we can eliminate these supposedly hidden hoards of rupees our path would be comparatively clear?

10,062. (*Chairman.*) What are you assuming in your question, Mr. Preston? Are you assuming the continuance of the exchange standard or are you working towards a full gold standard?

10,063. (*Mr. Preston.*) Continuance of the exchange standard?—Yes. I think that one of the difficulties of the situation is created by the existence of the silver rupee with unlimited legal tender privileges, and the fact that it is believed to be hoarded as a store of value in rather considerable quantities.

10,064. You see, as far as we are concerned it seems to me that we are trying to fathom the unknown in the sense of the amount of silver hoards which are out against us, and also the amount of notes which might in-come at any period and if we can convert the unknown into the known, it would make the position in every respect so much the easier. Until we can finally bring a new proposal into working, we will have to adopt some methods and my suggestion with regard to putting a limited legal tender on rupees was that if it were possible to find out really as a result of that whether there were such hoards of rupees in existence as is generally supposed to be, you might be of great help?—I think you would probably find it out; you would find it out by the large quantities of silver rupees coming in for the conversion into gold, which is what you want to avoid at the present moment. The assumption is that you want to avoid it. To answer your original question, my own feeling is that the withdrawal of the legal tender privilege of the rupee must come rather at a later stage.

10,065. (*Chairman.*) I would like to point out that it is likely that we shall get a little confused unless we remember that so far we are proceeding on the assumption that the rupee is not made convertible into gold.

10,066. (*Sir Purshotamdas Thakurdas.*) Sir Basil, under the scheme that you have just now named as the alternative scheme which has been suggested to you, against a rise in silver do you apprehend that there will be a raid for silver rupees on the treasury as soon as this sort of notification is issued, a raid for conversion of the paper, when people realise that after a few years the paper is going to be inconvertible?—I do not think there would. After all we are in a very strong position for dealing with any such raid. It would really be to our temporary advantage if there was such a raid; of course one does not want to damage the position

of the note which would be the hidden result of such a raid.

10,067. Let us look at it from this point of view, Sir Basil: I think you said at Delhi and Mr. Denning also said, that if gold was offered in exchange for rupees there will be a raid by the people to take the gold instead of silver?—Yes, because the gold standard proposal would be to some extent an announcement to the public in general that the silver rupee was being dethroned, I think those were my very words.

10,068. Now, when the silver rupee is going to be dethroned the other way, in the sense that paper currency is not going to be convertible into silver after a certain number of years, will, the same mentality of the people not say "Let us get the silver rupees whilst we can get it lest within two, or three or five years the paper in our hands becomes absolutely inconvertible and not worth anything in precious metals?"?—I do not think so.

10,069. You do not think the same mentality could work the other way about?—I do not think the anology is really a fair one. After all it is proposed, not that the note should be made inconvertible, but that it should be made convertible absolutely into foreign exchange.

10,070. Quite right; as far as the man in this country is concerned, it is inconvertible?—Yes.

10,071. His savings can only be in precious metals or in paper?—Or securities.

10,072. Even if he wants to look at precious metals, he cannot look at it?—He can use the paper to buy the precious metal at any time.

10,073. But he cannot have it in case of any emergency as a war or anything unforeseen?—He is just in the same position.

10,074. You know the mentality of the people when the war broke out?—Yes.

10,075. And you also know the state to which the Government treasury were put to in order to get the confidence of the people in paper?—As a matter of fact, I think I am right in saying that the effect of the war in disturbing confidence in the currency at the outbreak of the war was rather less than a good many people had anticipated.

10,076. But it was bad enough to upset the Government of India and make them very anxious at certain stages?—At the outbreak of the war, was it?

10,077. No, later on?—The serious point came when the Government were very anxious because of their difficulty in providing rupees with which to fulfil their obligation to give rupees for notes; the notes were in existence; they were a promise to pay rupees; and the anxiety of the Government was that they might not have rupees with which to fulfil their promise.

10,078. The desire of the Government was to avoid inconvertibility?—Yes.

10,079. I suggest that that same anxiety which made Government go several steps in order to avoid inconvertibility may again be the cause of Government's anxiety in case of a declaration that there will be inconvertible paper a few years later?—The anxiety of the Government arose from the fact that they had an absolute obligation which they were in a difficulty as to carrying out; they would have been very glad, I think, if they had been in a position at the time to make tho note inconvertible.

10,080. Because there was this obligation, you want to get the Government out of this obligation?—Yes.

10,081. What I am thinking of now is the extent to which the people will stand Government getting out of that obligation?—It would be a matter of experience spread over several years; the notes would circulate side by side, as I have suggested; it would not be a sudden withdrawal from the holder of a note of a privilege that he has got; but the gradual replacement of notes carrying that privilege by notes not carrying that privilege.

10,082. And if the inconvertible paper circulated at a discount, I take it that Government would learn by experience, and would advise some other scheme?—It would, as I said, depend to a certain extent on the general atmosphere at the time at which the thing was introduced.

10,083. The general atmosphere can only be based on the mentality of the people, as we know it and have been knowing it for the last one hundred years?—A good deal depends, I think, on the professional attitude of Indian politicians, if I may put it, towards a thing of this sort.

10,084. The professional Indian politician also can base his theories, and his maxims on what he sees feasible with the Indian public?—Yes.

10,085. And what do you think is feasible with the Indian public?—He could also base it on what he thinks is to the interest of the Indian public.

10,086. He sees that the Indian public is accustomed to precious metals: the paper currency came in after the British Government; there was no paper currency before the British Government, as far as I am aware of?—That is one of the benefits of British rule.

10,087. I am not at all challenging it; I say it is a great benefit; my point, however, is that that benefit should be allowed to take root: is it likely that you may be giving a rude shock by any scheme like this, until that benefit has taken deep root?—I do not think it would give it a rude shock. I can only express obviously an opinion on a psychological factor which almost no one is completely in a position to gauge.

10,088. You do not think what happened between 1914 and 1921 is enough to guide us as far as that experience is concerned?—What happened between 1914 and 1921 is really the basis of my confidence that this further step forward in regard to paper currency could be taken without any severe trouble.

10,089. Declaring the paper currency inconvertible?—Or substituting gradually inconvertible notes in place of the present notes; I do not like to put it in that form, a declaration that paper would be inconvertible, because that suggests going back on an obligation. What is proposed is the introduction in substitution of the old one which carried with it the privilege of conversion of a new paper currency not carrying that convertible privilege.

10,090. As far as the difference between your declaration of it and the other method which you suggest I suggest that the inference would be clear as soon as the Commission's Report is out, would it not?—I think it would mean a considerable difference to the success or otherwise of the alternative scheme in this matter if people spoke of it as a declaration that the paper currency was inconvertible or as substituting improved paper currency carrying a provision for convertibility into foreign exchange. I think the mere form of words would be all important; that is the reason why I draw attention to the phrase.

10,091. If it is so decided, I think it would be put in the form which may make it most acceptable to the people; but in fundamentals it would mean the samo thing?—No. I think that declaring paper currency inconvertible must mean taking away a privilege from the existing paper currency which it possesses; I do not propose that; I propose substituting a new paper currency.

10,092. Inconvertible for local purposes?—Yes.

10,093. I do not want to use the word, but I am sure you will not misunderstand me—I shall use the same word that you used in reply to the Chairman; is it not liable to be called camouflage?—I do not think it is camouflage at all.

10,094. It would be the same thing; the paper currency would be inconvertible locally?—The paper currency would be exactly the same as the British pound and ten-shilling note.

10,095. And would be inconvertible into any precious coin in India?—Yes.

10,096. Do you think that this would lead to encouragement of hoarding very seriously, of precious

metals, both gold and silver?—I don't think it would have any such effect. You see my trouble is this that I have got to assume that the other system, the gold standard, is not for some reason or other, capable of introduction. On that assumption I put forward an alternative proposal.

10,097. The second best?—In a way it is the second best in the sense that I believe the other would be more immediately advantageous to the people of India. But what I propose is that, owing to the difficulties that are assumed to exist in the way of introducing that intermediate stage, an endeavour should be made to go straight off to the international exchange system.

10,098. And my question is directed towards finding out whether this ideal stage, the final ideal, is likely to be injurious to the country as a whole or not if taken in one step? I am asking you these questions in that connection. I put it to you that, in view of the inclination of people towards hoarding, of which the Government and you individually tell us there is a considerable amount still left, would this not lead to more hoarding, or if you like it, the same hoarding as is going on at present?—I don't think it would make such a big contribution to the encouragement of the investment and banking habits as some other possible currency system, but I believe that it would be an improved system that would be better than the present and by being more intelligible and simple would have a tendency, though to a less extent than the gold standard to encourage investment and the banking habit.

10,099. At present people are said to be hoarding either the silver rupee or gold bullion?—Yes.

10,100. That is when they know that they can, if they have a certain amount in the post office savings bank or in one of the banks, draw the money, go next-door to the treasury and get silver rupees for it?—Yes.

10,101. With the other case, they would not be able to do that, five or seven years hence, whenever that final stage is reached. And you still think that this would be more encouragement to the people than the present system?—In practice they would be able to draw their money from the post office and go next door and get silver rupees for it for a great many years, as far as I can see.

10,102. I think you said 90 crores would last for ten years without any sort of great rush?—Yes, but after that there would still, though the currency authorities would no longer have a large surplus of rupees in stock, there would still be something like 300 crores of rupees in circulation.

10,103. But they would not be able to get it?—It would only mean that occasionally possibly there would be difficulty in obtaining silver rupees.

10,104. They would not get it for the mere asking for it. Somebody must give them silver rupees for paper currency.?—I said that the one rupee note would in practice be found to satisfy the currency requirements of the people to a sufficient extent. Then also it might be possible to issue a new rupee.

10,105. Debased?—Well, debased is again a *petitio principii*. A rupee with less silver contents. But it is not an essential part of my proposal that you should absolutely give up silver rupees altogether at that stage.

10,106. I thought you said no more rupees should be minted?—That is one of my suggestions but it is not absolutely essential that you should cease for all time to coin silver rupees.

10,107. But don't we start with this scheme as a protection against a contingency re the rise of silver prices?—Yes. Because you get that protection not as against the rupees in existence at the time when the bullion value goes above the coinage value but by the fact that when you have no longer the obligation to redeem your notes in silver, you can redeem them in one-rupee notes.

10,108. Would this scheme not lend itself to the same manipulation and management as the exchange standard scheme?—I don't think that an exchange standard scheme lends itself to manipulation or management any more than a gold standard itself. If the exchange standard as previously in force in India did lead to manipulation, which I am prepared to contest, it was because it was not fixed. There were no gold points fixed by statute,—not because it was an exchange system. The exchange standard is in existence in a great many countries and has, I think, no more led to manipulation than the gold standard with gold circulation. It is not because it is an exchange standard that it is manipulated but it had to be manipulated during the war because every country in the world found it impossible to stick to pure currency theory.

10,109. You don't think an exchange standard by itself lends itself to more manipulation and management than a pure gold standard?—No, I think not. Not unless you have the currency consisting of nothing but silver or nothing but gold. Once you have notes in circulation there must be management, whether it is an exchange standard or a gold standard.

10,110. The Commissioners who reported to the South African Government say in para. 31 (d) of their report, "conservative capital seeks markets where the prospects of stability are good and will prefer for some years to go to countries on the gold standard to countries with managed paper standards." Do you agree with that?—If I remember rightly—I have not seen that report for some time—the Commission by the words "managed paper standards" are referring to a country with a currency that is not fixed on a ratio to gold at all. If so, I entirely agree, but I cannot believe that they mean that investors would prefer a gold standard country to a gold exchange standard country because I think Dr. Vissering was one of the authors of the report and he was also one of the members of the Genoa conference which unanimously spoke in favour of the international exchange standard. So that I cannot think that he meant to say by that phrase anything which would throw doubt on the validity of an exchange standard with statutory provision for convertibility into international exchange. What he says is not of an international exchange standard but of a managed paper currency. After all the French is a managed paper currency, I think. That is what I think he meant by managed paper currency—he was writing at a time before sterling was back at par with gold. And the first question was whether South Africa should fix its new currency system in relation to a sterling standard or a gold standard. What he was speaking of was the alternative between having a standard that fluctuated with sterling and a standard that fluctuated with gold. The system that is unanimously proposed in India is a system that fluctuates with gold. I don't think anybody has suggested one that fluctuates with something that is not gold.

10,111. Was not that suggested till 1914 and was it not later regarded as the sterling exchange standard system?—But that system, as the very name implies, was then a system essentially the same as the gold exchange standard because nobody distinguished between sterling and gold.

10,112. What was called the gold exchange standard was said to be based on the gold point in 1914, very rightly?—As a matter of fact it was not the depreciation of sterling that upset the rate. It was the appreciation of silver.

10,113. Anyway the whole of that Indian system lent itself to great derangement from what was acknowledged to be pure gold exchange standard?—But so far as the actual question of the South African report is concerned, the answer is I agree if it is speaking of paper currency, not fixed to gold.

10,114. And regarding the gold exchange standard which you now advocate, you think that what happened in or after 1914, India can avoid a repetition of the thing in future?—The object of my suggestion that you should make the notes no longer

convertible into silver rupees is to prevent what happened in the war regarding it.

10,115. You think it will give definite protection?—Definite protection, I believe, if it should be adopted.

10,116. (*Sir Purshotamdas Thakurdas.*) Now regarding the export of gold, Sir Basil, what sort of arrangements do you think are possible as far as the French possessions in India are concerned and as far as Kabul?

10,117. (*Chairman.*) As far as what?

10,118. (*Sir Purshotamdas Thakurdas.*) Kabul across the border; an independent state, the Amir of which is known as His Majesty the Amir of Afghanistan.—That is the sort of difficulty I had in mind when I said that I have never seen a practicable scheme for gold for export worked out. But you might I think—I don't know whether Afghanistan is on the gold standard?

10,119. Well, it might be on any standard that is convenient to it, whenever the question comes up.—It is probably on the gold standard, most of the really backward countries are. Some provisions might be made, I suppose it would have to be laid down that the Imperial Bank authorities must be satisfied that gold was for actual export to some port in a gold standard country or something of that sort.

10,120. That would have to require consideration?—Very careful consideration.

10,121. The essential point is that the Imperial Bank authorities will have to be satisfied that the demand for gold for export is a legitimate demand for gold for export. The difficulty is to see exactly how to frame your regulations, because you want to make the power to obtain the gold a real one that can be enforced. You don't want to make it one that can be prevented from operating when it is really required.

10,122. Do you think that the liability of a scheme like this to inflation and deflation at the will of the person operating will be any the less than it has been till now?—Expansion and contraction of the currency will be absolutely automatic, exactly as it is under any gold standard or gold exchange standard system. The liability for seeing that the automatic system works will rest with the Imperial Bank and its discount policy just as it does in England with the Bank of England and its discounting policy. Currency will increase or decrease absolutely automatically at the will of the person who wants to increase or decrease, the ordinary man in the street.

10,123. Yes. I understand, Sir Basil, that you recommend this for its simplicity?—Yes.

10,124. And if the people of India did not evince that confidence in this which they had in the currency policy till now, it would surprise you?—Yes.

10,125. One more question. Do you apprehend any sort of serious misunderstanding on the part of the people when they are told that gold is available for export but is not available for internal currency?—I don't think so. It is again a question of presentation. Gold of course is not available for internal currency at present and what is proposed under this system is that there should be no change in the matter. Those who presented the position would have to be careful to explain to the people that their power to get gold which at present is absolutely unlimited in the market will not in any way be interfered with.

10,126. That is on private account?—Yes.

10,127. But I am thinking of an unfriendly critic of the Government or, if you like it, a political agitator, who can without being incorrect say that under the new scheme gold is available for export abroad but is not available to us. Don't you think it would be rather a serious aspect which may have to be taken into consideration?—That involves no change in the present system, and after all the answer is that the system is exactly the same system as is in existence in England, Germany and America.

10,128. With this additional rider that in the course of years the prospects are that people will not get silver for paper notes as at present?—As in England.

10,129. It does not matter. It may be in other countries. You would not get it in India?—If that is the way in which the question is presented the answer must be an endeavour to present the true facts in their most attractive form.

10,130. (*Sir Reginald Mant.*) Sir Basil, under the pure gold exchange standard which we have been discussing this morning, gold would be issued for export only and I take it that there would be no gold coin that would be legal tender in this country?—That was my suggestion.

10,131. You referred to the suggestion of introducing an optional gold currency as a piece of camouflage?—It seems to be suggested with that object.

10,132. Well, there is one aspect of the question that I would like to discuss with you. A good many of our witnesses have expressed a suspicion that western nations were trying to force on India a system which they were not really seriously adopting themselves. We have been told that the Genoa conference recommended the adoption of a gold exchange standard but that the western nations had not really meant to follow it out and we have had quoted to us the dictum of some American professor who said that the gold exchange standard is suitable only for dependent states. With a view to dissipating those suspicions I want to ascertain from you to what extent the systems adopted in Europe have approached to that ideal gold standard which you have been discussing. You said that in London from the 1st of January gold will be given in large quantities without any condition as to its being exported?—I think that is so, isn't it?

10,133. I understand that was the case. Well, that might be quoted in support of this view that the English system does not conform to the ideal system?—But I think that it would not be true to say that that did not conform to the Genoa ideal. The ideal of Genoa of course looked forward both to the near future and to the somewhat distant future. In the distant future I think it contemplates a sort of universal federal reserve board for the world managing the gold reserves of the world in such a way as to maintain reasonable stability in gold commodity prices preventing fluctuations in the supply and demand for gold from upsetting prices in the way that had been experienced in the last decades of the 19th and the first decades of the 20th century. The nearer ideal was that each country that could do so should get back as soon as it could to parity with gold. It should not put gold coin into circulation and should be reasonable in regard to its own reserves of gold; that it should keep its reserves or rather the reserves with which it secured the stability of its internal currency with gold rather in the form of credits at big centres like London and New York than in large quantities of locked-up gold on the ground that the gold was likely to go further if it was kept in very central reserves. And I think that is very much what has happened. Austria, Germany, Hungary, Latvia, Sweden, and so on, all the countries that are on the gold standard have been trying to economise gold generally speaking. Switzerland at one time for its own purposes did try to put gold into circulation with a view to preventing itself from having too much gold. But I think it is true that there is a gradually increasing advance towards the nearer ideals of Genoa going on in Europe at this time. Certainly none of the countries that have gone back to gold have put gold into circulation. They have all been very careful not to do so.

10,134. Your reply to some extent bears out the criticism that we have received that the western nations have not completely adopted the ideal of the Genoa conference but that they only regard it as an ideal to be worked up to gradually and if we suggest that India should go on to it straight away shall we not still leave room for these suspicions?—I don't think that this scheme we outlined this morning is any nearer the ultimate Genoa ideal than the scheme

adopted by Germany for example. It is not proposed that India should do altogether without a gold reserve and should keep her gold reserve in another country. It is proposed that she should have as against her notes gold and gold securities in exactly the same way as these other countries. There is no suggestion that India should take a step further than has been taken by those other countries.

10,135. But is it not one step further? You say that in London gold is now being given out for internal purposes, whereas under the system proposed for India gold would only be given out for export. Would not the critics freeze on to that?—There is always something for critics to freeze on to in any system, but the answer to that I tried to give was that gold is equally available for internal purposes in India as it is in London at exactly the same market prices.

10,136. You would not see any very strong objection to Government giving out bullion in India?—I think that I would be perfectly willing to make it part of the plan that the Imperial Bank had the option of giving out bullion in India if they choose to do so.

10,137. The Bank of England has an obligation, has it not?—For internal purposes, yes. Of course, the essential difference is that the proportion of the demand for the gold for non-currency purposes is infinitesimal in these countries whereas it is 99 per cent. of the demand in India.

10,138. Quite so. I see that the obligation of the Bank of England is not a practical difficulty or objection under the system there. But I am trying to devise means of meeting these criticisms which are freely made here?—As I have said, in order to establish that complete confidence that I would like to see established, I should like, if it is feasible, for a system to be adopted which does impose upon the Imperial Bank the obligation of giving gold for internal purposes. But this discussion is on the assumption that it is not feasible.

10,139. You are referring there to gold in the coined form?—Your suggestion is that you should stop at the bullion form?

10,140. Yes. I was only trying to meet the criticism?—If you give gold in bullion form I should see no objection to that if it is feasible because it is after all in accordance with my original proposal. But I am not sure that that is possible without going the whole distance, whether that does not involve the upsetting of the world markets which is the presumable objection to the introduction of the gold standard.

10,141. Do you think that there would be any larger demand from India for bullion if they obtained it through Government than if they obtained it as at present through bullion dealers. Would it have the effect of upsetting the world market?—In order to create that obligation you have your paper currency and your rupee convertible at will into gold bullion. That is the only way in which you can give that obligation. If that did not have the effect of making holders of rupees change them at once for bullion it would not of course increase the demand of gold in India.

10,142. Because they can practically convert it at will at present?—Yes.

10,143. Then with regard to coins being legal tender, what is the practice among the nations in Europe who have adopted the gold exchange system? Have they no gold legal tender? Is the sovereign not legal tender in England?—No one has any to tender.

10,144. But surely it is still legal tender?—Its legal tender character has not been taken away. I don't think that as a rule any new gold coin has been introduced as legal tender in the countries that had not got one before.

10,145. But India has had a legal tender coin, the sovereign, and they might say that here again you are taking away a privilege which is still retained by the so-called gold exchange countries?—You might leave the sovereign legal tender; of course it would be a very awkward fraction at 1s. 6d. What I was speaking of was not so much the sovereign but minting a new gold coin for circulation.

10,146. I come back to what you describe as camouflage, that is perhaps a rather unkind description of it in view of the fact to which I have drawn attention that the other countries on a gold exchange standard have retained the gold coin as legal tender, and that it might be useful in India, not merely camouflage, to have a similar arrangement here?—You might retain the legal tender character of the sovereign but if you go on to introduce a new Rs. 20 gold mohur as optional circulation, with what arguments will you convince the people concerned of the necessity of the expense involved.

10,147. It is hardly a question of convincing the people of the necessity of expense: it is rather meeting their own demand that they should have this gold coin in order as they believe to put themselves on an equality with other nations. We have had it put to us rather as a sign of political status that there should be a gold coin in circulation. It is purely a political, not an economic question: dealing with it from the practical point of view, with the political situation of India, you cannot altogether ignore that frame of mind?—You would not go further than that I suppose and say that if the people of India really want a gold coin to play with, as I have put it, and are prepared to pay the expense, let them do it but we do not pretend to regard it as an essential part of the system that we are proposing or anything more than a quite unnecessary and rather expensive embroidery of it. If it is put in that way, my objection would not be so strong as if it was put as an important part of the new currency system.

10,148. It has been frequently stated I think by previous Commissions that India ought to be allowed to have the currency that she wants, and for the same reason you might allow her to have a certain amount of gold currency if she wants it though you would regard it as useless?—If India wants a new gold currency for the right reasons, wants it in order that all her other currency should be convertible into this gold currency, she does not want a superfluous gold coin circulating here and there over and above her currency system.

10,149. The word 'want' is there used in different senses?—Yes.

10,150. Just one other question with regard to the difficulties in the way of securing that gold given for export should be exported: could you meet those difficulties by imposing on the Bank an obligation to deliver gold at a foreign centre such as London?—Yes, but that is rather a difficult obligation to impose, because if the gold is in London and you have a calamitous event as a result of which the export of gold from London is prohibited, the obligation to give gold in London does not amount to much, if it cannot be exported from London; and it does not really fulfil your purpose, unless the gold is free to be exported for currency purposes to any place where its export for currency purposes is needed.

10,151. It would not be possible for the Bank to have a gold reserve in London which would not be liable to be detained by the authorities there?—I think in practice that might work. Of course that is the position in which several countries have been during the period of the embargo on the export of gold; the South American countries and Egypt and Japan I think all had gold in London which they were allowed to move independently, in spite of, the embargo; and of course Germany for some time had gold in London which she was moving to and fro in spite of the embargo under special arrangements, but it does involve something in the nature of special arrangements made at the time. Undoubtedly the useful place for some part of the actual gold held by the Imperial Bank would be in London, though I imagine that for various reasons the greater part would be held in India. The difficulty is of course that if you want gold

for real currency purposes, in 99 cases out of a 100 exchange in London would be more useful to you than gold. It is a quicker way of getting what you want.

10,152. But you have always got that?—So that the obligation to give gold for export is only required to come into play in rather exceptional circumstances. It is really required as a sanction in order to force the Imperial Bank at all times to give foreign exchange within the gold points. It is another way of expressing the same thing.

10,153. Would not the obligation to give gold in London operate as a sanction?—It would be so long as sterling was on par with gold, so long as the export of gold from London was free.

10,154. (*Chairman.*) I have just one or two questions to ask with reference to the previous questions. The effect of a sound exchange standard is to stabilise the gold value of the rupee is it not?—Yes.

10,155. So that the rupee is always worth so much gold. You pointed out in one of your answers that it would always be open to the holder of notes to use his notes for the purchase of gold in the bazaar?—Yes.

10,156. Therefore, although legally the note is only convertible into international exchange, practically it would be possible for the holder of the note to obtain gold if he required it?—The effect of the establishment of a gold exchange standard would, of course, be to make the price of gold in the bazaar fluctuate within the same limits as the exchange.

10,157. The point which I understood you desired to bring out was that, although there was an apparent convertibility into international exchange, practically the power of the holder of the note to get gold when he wanted it internally would be the same as ever?—Yes.

10,158. And, in addition, you would stabilise the price of gold in the bazaar within narrow limits?—Yes.

10,159. I understand that, although in your proposals for a perfected exchange standard you mention the cessation of the coinage of rupees, nevertheless you would contemplate that, in some remote future, it would be necessary to provide more rupees for small change, if that could be done?—That would be a question that could well be left for the experience of the future if you introduce the new system. You would always want actually for ordinary circulation purposes a large number of coins of the value of the rupee; you could not contemplate the people of India doing without the rupee any more than the people of England doing without the shilling comfortably. But the question whether it would still be the same silver rupee is one that might be decided later.

10,160. What foreign capital needs for its encouragement, if one is contemplating investment in this country, is, I understand from your reply, stability of exchange?—I do not think I have said anything about foreign capital.

10,161. I thought you were speaking about the investment in India of capital from without?—I have not mentioned that to my knowledge; I was speaking of encouraging the habit of banking and investment by the people of India instead of hoarding.

10,162. What capital requires for its encouragement when it is contemplating investment is stability in the value of the currency in which its interest is paid, and in which it will finally be repaid?—Yes.

10,163. If that stability is equally obtained by standard A or standard B, then as regards that consideration there is nothing to choose between the two standards?—That ought to be so, but it is not merely that the currency should be stable, but that people should be equally convinced that it is.

10,164. Is there anything which promotes a conviction of stability so surely as experience of stability?—Over a longish period I should say that there is nothing, but if you want to promote confidence to a greater extent than it exists at any given time, the offer of a fully valued gold coin convertible into gold does, I think, promote confidence more quickly than the offer of an inconvertible coin fully convertible into foreign exchange.

10,165. It accelerates the process?—Yes.

10,166. Nevertheless, supposing you attain stability, you would be operating for a long period of time in order to encourage that confidence which is essential in order to produce the investment habit?—I quite agree.

10,167. Supposing the obligation to support an exchange standard is the obligation to sell gold for export; supposing that is subject to the limitation that the Bank may refuse, if it is not satisfied that the gold is required for that purpose *bonâ fide;* in order to make the system absolutely water-tight, would it then be necessary to supplement that obligation by an alternative obligation to sell foreign exchange, otherwise might it not be said by a critic that you are really putting it in the power of the Bank to suspend the operation of the machinery to maintain the exchange?—It is most important, I think, that whatever system you establish should be one where not only is there no power on the part of the authorities of the Bank to interfere with its automatic working, but that people should also be convinced that that power does not exist.

10,168. It appears to me that if the only obligation is to sell gold for export, and if you give the Bank power to refuse to sell gold because it considers that that gold is not required for export, then in the opinion of the anxious critic you may be really making your system not water-tight unless there is an alternative obligation to sell foreign currency?—Yes; I think I agree entirely in that point. One of the difficulties of the proposal for giving gold for export only is that if you want to restrict for export only you have to impose rather carefully thought out restrictions, and those restrictions may either operate or may be thought to operate so as to prevent the system from being a thorough system.

10,169. That difficulty would be met possibly by imposing the alternative obligation, if gold is refused, to sell foreign exchange?—Yes; I should see no objection to both obligations being imposed, provided that the export point can be dealt with properly.

10,170. You pointed out how an exchange system is subject to the degree of manipulation or management which may be involved in a control of the discount policy. Is the discount policy any less important as affecting the currency system of the country under these proposals which you have made for a full gold standard?—No; in both cases the maintenance of the parity of the currency with gold depends ultimately on the policy pursued by the currency authority. No currency can stand the strain with a wrong discount policy by the currency authority.

10,171. So that as regards the element of management referrable to the control of the Bank rate there is nothing to choose between the two policies?—Nothing whatever.

10,172. You were asked by Sir Reginald Mant to consider the possibility of the Central Bank, under an exchange standard in India, accepting precisely the same obligation as the Bank of England, that is, to sell gold in minimum quantities in the form of bars without regard to the purpose for which it is intended?—Yes.

10,173. That, as you pointed out, would have the effect of making the Indian notes and rupees convertible into gold bullion?—Yes.

10,174. As I understand it, in the scheme which you outline for a full gold standard, you expect the demand for the conversion of rupees to arise principally from the circumstance that it would be the definite policy that the rupee is to be limited as legal tender?—Yes.

10,175. But for that approaching dethronement of the rupee, you would expect no greater demand for conversion of the rupee than there is at present?—No; it is the threat to the rupee of dethronement involved in the policy to substitute convertibility into gold for convertibility into the silver rupee which is, I think, the main reason leading one to anticipate a

somewhat considerable demand for the conversion of rupees into gold bullion.

10,176. Supposing the Bank were to undertake the obligation to sell gold in minimum quantities in bullion without regard to the purpose, and supposing there were at the same time no intention, either existing or announced, of limiting the legal tender of the rupee, would there, in your opinion, be any probability of any great demand for such bullion against rupees? Might it not be an obligation which could be undertaken with comparative indifference?—That thought passed through my mind when Sir Reginald Mant put the question, and I was wondering whether it was not possible, on the assumption that the full gold standard proposal suggested by us is found to be difficult, to go the first stage and make the note convertible into bullion in India or outside; if it did not have the effect of causing a large demand for conversion of rupees into gold bullion there would seem to be no difficulty in introducing it.

10,177. Nevertheless, I think you may be considering that there is a danger involved of a drain on the reserves. It would be useful to try and apprehend what the degree of that danger is?—It is, of course, in essence a final announcement of the end of the rupee as the one and only metallic coin in India, leaving out the sovereign, as the major factor in the currency system of India that it has been for the last century. It is definitely moving on from the closing of the mints to silver and the over-valuing of the rupee to the substitution, for the purpose of standard of value, of gold bullion for the old favoured rupee.

10,178. Is it proper to regard it in that light? Supposing one were to say on the other hand that it is only making more visible the link between the rupee and gold on an exchange standard system?—I think the question is whether that would have the effect which I understand is the effect that causes the fear of a large demand for conversion of rupees into gold bullion. I do not see why it should.

10,179. The proposal, of course, is most clearly discussed on the assumption that there is no gold coin as legal tender or available for circulation?—Yes. If you have a gold coin at all in such circumstances you presumably have a gold coin which anybody can obtain by taking the gold to the mint and getting it converted into coin. If you have got your rupee convertible into gold bullion, and in addition you have the right to take the gold bullion to the mint and convert it into a gold coin, you have got the full gold standard, and you are back where you were. This proposal for allowing the rupee to be convertible into gold bullion for internal and external purposes, therefore, does involve that you should not have a gold coin even in optional circulation; at any rate there cannot be the right to take gold to a mint to be turned into a gold coin.

10,180. Perhaps it might be looked upon as a substitute for the existing position of the sovereign as legal tender?—It is more than a complete substitution; it is an improvement from a theoretical point of view.

10,181. It really involves at bottom, does it not, the practical consideration as to whether or not it is likely to create a large drain upon the reserves?—That is the question, yes. At first sight I do not see that it would create difficulties.

10,182. Lastly, we have not yet mentioned the question in any detail of the reserve in gold which it is necessary to keep under such an exchange standard as we have been discussing. I understand that you see no objection to keeping a portion, or the whole, of that in India?—If it is going to be used clearly and effectively at the right moment, there is no doubt that some international centre, where it is likely to be required, would be on the whole a more convenient place than India for keeping it. But subject to that qualification, there are no very great objections to keeping it in India, and there are of course historical, well-known political reasons for doing so.

10,183. It might well be weighed against any question of practical convenience?—One would hope something would happen corresponding to the case of Japan. Japan keeps a certain amount, perhaps a major porton of her gold, in Tokyo or Yokohama, but also keeps considerable amounts abroad.

10,184. It might also be a question for consideration whether it might be better to begin with rather more gold in India, and leave it to the process of time and the growth of confidence in the system to reduce tho Indian proportion?—I should be sorry to see any absolute rule laid down that under no circumstances should gold be held elsewhere than in India.

10,185. As to the proportion of gold to be kept, would it be possible to keep a larger or a smaller proportion of actual gold for securities in the reserves when it is kept under the system which we have been considering than is kept at present?—We discussed that at some length when I was before the Commission before, on the amount of the gold that ought to be kept in the gold exchange standard, international exchange standard.

10,186. If that be so—it escapes my memory for the moment—we need not cover the same ground again?—I think we agreed that theoretically you may say that you do not absolutely require gold under either the sterling exchange standard or the other system, but that you would in practice keep gold in both, and you would probably keep more under the gold exchange than under the sterling exchange standard.

(*Adjourned for lunch.*)

10,187. (*Chairman.*) Sir Basil, our questions this morning proceeded upon the basis that, for one reason or another, the scheme for a full gold standard was unattainable. I want now to ask a certain number of questions upon the contrary assumption, that an essential step towards the ultimate goal of an inconvertible note currency is a preliminary stage during which gold is available for circulation and the rupee is for a period to be made convertible into gold as a preliminary stage before the rupee is made limited legal tender; in other words, adopting as an assumption that the proposals for a gold currency sketched out in the memoranda which have been put before us are adopted. In this connection I want, in the first place, to draw your attention if I may to a body of evidence which has been developed before the Commission, the general effect of which is this, that the proposals outlined in the memoranda which you and your colleagues have submitted to us proceed by too rapid stages, and this body of evidence to which I refer suggests other proposals which are more gradual. I fear my question must be rather long. It is in substance this, to ask you to consider alternative proposals which have been put before us for a more gradual introduction of the convertibility of the rupee into gold, for a more gradual progress towards the stage at which the rupee is made limited legal tender. Let me put my question in this manner. What would your opinion be about such a more gradual policy as has been suggested to us in various forms, but of which the essentials are these, that, as a transition stage, you should establish an exchange standard on such a basis as that which we have discussed this morning; that you should cease coining rupees and promote the issue of small notes in substitution for rupees; that you should establish a Mint and coin gold brought to the Mint free of charge into a standard gold coin which will be legal tender; and then that you should wait to take any further steps towards the attainment of the stages of making the rupee convertible into gold and limiting the legal tender of the rupee until such time as (*a*) the spontaneous passage of gold into circulation through the Mint; (*b*) the increase of the note circulation by the habituation of the people to notes in proportion to rupees; (*c*) the natural absorption of rupees; and (*d*) the gradual replacement of rupees in hoards by gold, which should reduce the problem of the excess of rupees outstanding to manageable dimensions?—It is a somewhat difficult question to answer otherwise than very generally. As I understand, it is contemplated that instead of spreading over a period of ten years the transition to the full gold standard, you will spread it over an unascer-

tained and undetermined period which would probably be as much as a generation and a half, no date being specified. My first difficulty is this, that I do not regard the use of gold in circulation and the gold standard as the ultimate or final ideal. I advocate it for early introduction on the ground that there is need for some early action to give special stimulus to the investing and banking habit among Indians in place of the hoarding habit. If it is fifty years before you are going to reach this gold standard, it seems to me to be a wrong ideal to set before India. The gold standard is not in my mind the ideal; it is in my mind an early transition stage to the ideal of an international exchange standard. If you cannot introduce it at a reasonably early date, do not set it before India as an ideal at all. That would be my first answer. An exchange standard as adumbrated in the question is, I think, not very different from the kind of exchange standard that we were discussing this morning except that there is added to it some provision for a mint open to gold and gold coins in optional circulation. As I said this morning, I see very little advantage in gold coins in optional circulation. *Per se*, I regard it as a bad rather than a good ingredient in a currency system. So that I think my general answer would be that if the period is going to be very considerably delayed before you can arrive at a gold standard with gold currency in circulation, do not aim at a gold standard for India at all, but do aim at trying to jump the step of a gold standard, and go straight to the ideal of an international exchange standard.

10,188. It would seem, then, that, in your opinion, such a process as this would take so long in achieving the purpose of preparing the ground for the declaration of the obligatory convertibility of the rupee into gold coin, and the subsequent limitation of the legal tender of the rupee, that during that process the natural process of education of the people in the use of notes and so on might have achieved the purpose of introducing an inconvertible gold standard without these auxiliaries at all?—Yes; I think so; there is this difficulty; I am not at all sure that this intermediate period will in fact do anything very much to assist the ultimate introduction of gold coin and making the rupee convertible into it. Unless you very definitely set before the public the dethronement of the rupee and the substitution of the gold coin as the ideal, I am not at all sure that there will be any very large replacement of rupees in what are called hoards by gold; and even if there is some considerable replacement, so long as you are issuing rupees you will, I think, be adding new hoards of over-valued rupees; so that, you will always have at any given moment up against you a large wall of over-valued rupees as an obstacle to the immediate introduction of a gold standard. Whenever you finally come to the decision that you are going to introduce a gold standard with gold in circulation, you will have to face the necessity of making a very large demand on the world's gold reserve.

10,189. Would not such a process as that which I have attempted to sketch in this prolonged question so spread the demand upon the world gold reserves as to avoid disturbing influence in any given year?—Is it proposed that there should be meanwhile built up within the Indian paper currency reserve a very large holding of gold?

10,190. No; that is another question which I wanted to ask next?—My view is that you will not get very much progress towards the possibility of the introduction of a gold standard with gold in circulation by simply relying on the natural tendency of the people to hoard gold rather than silver, and I think that it will take so long that it will not be worth pursuing for the sake of the sole object with which I recommended it, namely, giving of a stimulus to the useful application of internal capital in India.

10,191. On the whole you would be inclined to consider that such a procedure as this would probably lead to no result?—That is rather my fear, yes.

10,192. And as regards the policy you would say that, if it is done, then it is as well that it should be done quickly?—I think it is not worth being done unless it is done quickly.

10,193. Now to turn your attention, if I may, to the further possibility to which you refer, what would your opinion be of a policy which would supplement those measures to which I have just referred by devoting a certain amount, say, for example, an amount equivalent to the interest on the present gold standard reserve, year by year to the conversion of rupees or to strengthen the reserves with a view to the conversion of rupees some day?—To the actual purchase of gold?

10,194. Yes, the purchase of gold in order to undertake the optional conversion of rupees or to strengthen the reserve for the conversion of rupees some day?—My first objection to that is: supposing you were to decide that the interest on the existing gold standard reserve, namely 40 millions sterling, the amount of which we may roughly take as 2 crores a year, were devoted to purchase of gold year by year, that would cost the budget of the Government of India something approaching two crores a year, which is far more than I contemplate would be the cost of the actual introduction of the gold standard at once. It is really comparatively expensive and is a very slow process. If that is the only contribution which is going to be made to the building up of gold reserves, it takes ten years to add another 20 crores to the total actually held in gold. Meanwhile the budget of the Government of India is losing the whole of that interest year by year. My first objection, then, is that it is very expensive and my second is that it is a very slow process. You might add to it no doubt, or you might even more usefully attempt to build up your gold reserve by another means, namely, the issue of additional paper currency as and when required hereafter against gold instead of against external securities. That of course is an uncertain process. We have added nine millions sterling to the sterling securities held in the paper currency reserve this last winter, since October; and in a year of good trade you might contemplate that you would get a fairly big addition to your gold by that means; you would not by that means actually lose any of the interest that you are at present earning. You would lose the capacity to earn interest on additional securities because you would not buy the securities, but you would not actually be charging the budget with a charge which it does not at present bear, as you would be doing if you set aside the interest on the gold standard reserve. I have this further objection, that I am very anxious to see the gold standard reserve amalgamated with the paper currency reserve as part of any process of improvement of the currency system, and this proposal hardly works in with it.

10,195. No. To amalgamate the two reserves it would be necessary to set aside arbitrarily a sum including the present interest on the gold standard reserve?—Yes; that means of course that much reduction of the present income of the Government of India.

10,196. What would be the consequence of the suggestion to which you have just referred, that all future issues of currency should be made against an actual increase in the holding of gold?—It would of course depend very much on factors which it is not possible to estimate exactly in advance, namely, the rate at which the currency expands over a period of years, the net expansion of currency, and the amount of that expansion which is permanent. If it had been started in say September 1923 it would have meant an addition of about 24 crores of gold, I think, to the gold reserves. Of course one consequence of that would have been that the amount obtainable in relief of taxation from interest on investments of the currency would have been *pro tanto* reduced, and if you started it from now and it had the same effect, it would mean that the loss of potential revenue to the budget would be the interest on that amount. At the same time I contemplate that under any system that is likely to find favour, there must be some increase of the total gold at present held, 29

crores, not perhaps a very big increase, certainly not an increase of the size of 24 crores.

10,197. Such a procedure would mean, would it not, a constant increase in the proportion of the reserve to the liabilities of the reserve?—It would mean a constant increase in the proportion of the reserve held in gold.

10,198. The proportion of the reserve beld in gold to the liabilities?—Yes.

10,199. It would mean, in short, sterilisation year by year of a certain amount of gold?—Unless you have got some definite purposes in getting your reserve together, some definite object on which you intend to use it, there is always a very great danger in going on piling up a reserve at considerable expense which it becomes more and more difficult to use as people become more and more enamoured of its size.

10,200. The definite object in this case would be to indicate, when the proper moment arrives, the obligation to convert rupees into gold?—Into gold coin.

10,201. In the meanwbile sterilising gold in the reserves for that purpose?—Yes.

10,202. Experience in the United States has shown, has it not, that it is possible to effect such a sterilisation of gold?—It is not only possible but it is the main use to which the gold of the world is put. Nearly everybody has got a large gold reserve which they do not use.

10,203. Yes, but it would be an expensive policy?—It would be an expensive policy, yes.

10,204. And obviously more expensive than the use of gold for a purpose for which it is intended?—I think so, yes. It would be a more expensive policy and the reward which you aim at would be much longer delayed. I suppose it is possible but it is rather difficult I think to say that you are building up a reserve with a view to replacing the rupees by gold coin without risking the immediate demand for conversion of rupees into gold which is the danger feared from the other policy.

10,205. It might be considered that you would also be risking, would you not, the possibility that your process of sterilisation would break down under the pressure of the public demand for the basing of a bigger structure of credit upon these increasing holdings of gold?—I think that, so far as one can see the psychology of the people of India at the present time, they would be keener on seeing the reserve grow in size than they would on its being used. That is not peculiar to the people of India.

10,206. To summarise these questions and your replies, I understand that it would be your opinion that, both for the sake of economy and for the sake of obtaining these beneficial results, whatever cost is involved in embarking upon such a policy, the longer you wait, the more you prolong the process, the more you lose?—Yes. I don't think the policy of final gold is worth having for its own sake. It is a step towards a better currency system and is desirable for the immediate purpose of encouraging and stimulating the habit of right investment and banking in India and if it is delayed beyond a certain point I think that it is hardly worth while aiming at it at all.

10,207. There are just two points of view that have been suggested to the Commission which I wanted to put to you in order to ascertain your opinions upon them. The first is: What would be your opinion of a proposal which has been made to the Commission which would go with the proposals outlined by yourself so far as this, that both notes and rupees should be made fully convertible into gold but that there should be no limit placed upon the amount for which the rupee is legal tender at all, that that further step should not be taken?—That, I think, was my proposal this morning as the step which should be taken in the near future.

10,208. Yes, but the proposal is that that should not be an object of policy at all?—You would leave rupees in the same position as the silver dollars in the United States or the silver *five-franc* pieces, a gradually decreasing element in the total medium of circulation, ultimately becoming unimportant and negligible.

10,209. The effect of this being, I may point out, to avoid the possibilities of a rush for the conversion of rupees which might result from an announcement of the policy that the rupee was, on a certain date, to cease to be legal tender to an unlimited extent?—So long as the notes are convertible into rupees there are definite disadvantages in doing anything drastic with the rupee, but once you have got your notes not convertible into rupees, then I think that the biggest risk involved in the over-valued rupee is eliminated. Because it would almost, as a matter of course, if the bullion value of the rupee became greater than its currency value, follow that you would let it go out of circulation and substitute some either less expensive coin or a note. Then, if that does not happen, you would be happy enough with the rupee continuing as unlimited legal tender.

10,210. Then, as I understand it, if the convertibility of the note into the silver rupee is terminated, you would be content, after making the rupee convertible into gold, to leave it unlimited legal tender?—Yes, with the thought at the back of my mind that, if at any time its position of unlimited legal tender became troublesome, one might then take steps to limit the legal tender.

10,211. This might have a very important effect, might it not, in limiting the magnitude of the obligations involved in making the rupee convertible into gold?—That is very nearly the same question, but not quite, as we were on this morning. It is very hard to say what would or would not have the effect of making those rupees which are kept in hoards come out suddenly and convert themselves into gold. It is anything that does have that effect that creates the difficulties of the gold standard. But I suppose it is undoubtedly true that, if you don't put in the forefront of your scheme any proposal for limiting the legal tender of the silver rupee, it will be less liable to come out than if you do put such in the forefront. But that is about as far as one can put it.

10,212. There one can always refer to the experience of to-day. As a matter of fact, the rupee does not come out now?—It does not come out, except very gradually, now.

10,213. If there are any hoards?—If there are any hoards.

10,214. If there are hoards, they are hoards which are held, although they might be converted into gold at the present moment?—There certainly are some hoards and some hoards certainly have been converted into gold, especially during last winter. As stated in my previous evidence, the extent of these hoards is a matter of considerable uncertainty.

10,215. As I understand it, if you get rid of the convertibility of the note into the rupee, you place a wholly minor emphasis upon the abolition of the unlimited right of legal tender as applied to the rupee?—It certainly diminishes the emphasis very much.

10,216. The final question in this connection, to exhaust all possible suggestions that have been made to us, is: what is your opinion of another proposal, that it is possible and right to limit the legal tender of the rupee forthwith without providing any opportunity for converting the rupee into gold? It is said that if anybody holds rupee hoards they hold them *suo periculo*, and, to put it broadly, if they are so foolish as to do so, it is at nobody's risk but their own?—I think you would risk a good many charges of bad faith if you did not give very ample notice and though the charges might be such as were capable of argument for and against, I think you would risk leaving a feeling that you had been dealing rather fast and loose with your currency, which is a very dangerous feeling for a Government to create among the people for whom it provides currency. It is true that the rupee has not got printed on it that it is redeemable in anything in the way in which a note is, but it has been issued for nearly a hundred years as unlimited legal tender—for some years the only unlimited legal tender in the country, and I think you

would have to give very ample notice before you took that unlimited legal tender away. Nor do I see that any great advantage would be gained by immediately restricting that legal tender. You could not in practice evade the necessity of redeeming rupees in some other form of currency, if you had created a large surplus of rupees in the country. You could hardly then leave the holder to carry them at his risk and say that you are not interested.

10,217. What is the specific loss which the holder of a large rupee hoard, say of Rs. 100,000, would suffer, supposing that to-morrow it was declared that the rupee was legal tender for Rs. 100 only?—It depends on the way it is worked. If the result was that only such rupees as were absolutely required for carrying on the subsidiary transactions of the country remained usefully in circulation, holders of some unknown figure between 200 and 100 crores of rupees—we ourselves would be holders of 90 crores of that—holders of some very large number of crores of rupees would have nobody on whom they could unload them in theory.

10,218. In practice would they find it any harder than they do now?—In practice either they would find it very difficult, in which case they would be forced to carry them for years, perhaps decades, at a loss of interest, or else alternatively to sell them at a discount, or else the Government would find itself forced, in spite of the absence of legal obligation, to give some other form of currency for them. And you would then be in exactly the same position as if you had not given notice before they had come to the Government. I do not think that in practice the Government could evade its obligation in a wholesale manner by giving notice to-morrow.

10,219. Might it broadly be put thus, that the holder of a large hoard of rupees, say 100,000, would have then no practical purpose for which he could use his rupees, but neither has he now?—That is so.

10,220. So that he would not be any worse off than he is now?—Well, probably in theory, but in practice I think he at present regards himself as having the right of using his rupees for the purpose for which all money exists, for exchange when required into something valuable, and if you suddenly take it away from him, he would immediately set to work to convert it into money which he could use for the purpose for which he has kept the hoard. I think it would be rather sharp practice on the part of Government.

10,221. Of course one is confronted with the difficulty of understanding for what practical purpose a large hoard of rupees is held by anybody at the present time?—It is always difficult to understand, if you are brought up otherwise, for what reason anybody keeps a large stock of coin under his dining table or wherever it may be.

10,222. In working out the practicability of the scheme contained in the memorandum relating to a gold currency which you have presented, you say that there is nothing more important for us than to clearly apprehend the additional amount of gold which would be needed for India in order to enable this policy to be put into effect. I want to be quite clear that we have apprehended precisely what your own estimate is as regards the additional amount of gold which India will need over a period in order to carry this policy out. May I just put it to you and see whether any additions or corrections are needed in the original estimate. The estimate to which I refer is contained in Mr. Denning's memorandum on a Gold Standard for India, and as I understand from that memorandum, the estimate of the additional amount required is 137·2 crores, made up in the following manner, as set out in paragraph 18 of Mr. Denning's memorandum: 137·2 crores, made up as to 110 crores of gold required for the conversion of rupee hoards, and as to 27·2 crores as the additional gold required for the reserves, making 137·2 crores in all, equivalent to about 103 million sterling. May we take it that, according to your calculations, that is the additional amount of gold which would first and last be required to carry this policy into effect?—That is an estimate which I think all those who have been concerned in producing it regard as an outside maximum of the amount of gold which would be needed for the purpose.

10,223. Just to complete the account of the estimates formed, we understand that it would be required, as to 15 million sterling of the 103 million sterling, at the inception of the measures proposed?—Yes.

10,224. As to a further 35 millions within a year, and as to the remaining 53 millions over a period of 10 years; 15 millions at the inception, 35 millions within a year, and the balance of 53 millions, making 103 million sterling in all, within a period of 10 years?—Yes; naturally that last estimate does not profess to be anything more than a very rough shot. You have got a psychological factor, as the most important factor determining the pace at which the demand would come, and it is one which one cannot estimate. But the other figure, 103 millions within 10 years, may be regarded as an estimate of the maximum amount and for that we are willing to take real responsibility.

10,225. Recognising that it is the best shot that can be made?—It is meant to be a shot at the maximum, not at the probable figure.

10,226. I understand further that this is a maximum figure which you prudently put in the forefront as the greatest possible requirement?—Yes.

10,227. Could you clear our minds by referring to those factors which might tend to reduce that figure?—I have made one suggestion in my memorandum which would reduce slightly the amount of gold to be required in the form of a currency reserve. That is however comparatively unimportant. Really my figure in arriving at this estimate is the total of the rupees now in circulation or in hoards which would come out and be melted down. On that, the note on the amount of rupees outstanding by Mr. McWatters, dated the 30th November, 1925, contains a summary of all the information in our possession. The two important figures are, what is the amount of rupees still outstanding, not melted, and the second one is, what is the amount of rupees that will be required for the purposes of normal circulation in any circumstances. A low estimate of the latter figure is 150 crores, Rs. 5 a head of the population. A high estimate of the former figure is between Rs. 350 and 400 crores. Taking the probable figures, the amount still outstanding, not required for circulation, almost certainly does not exceed Rs. 200 crores and probably does not amount to more than 150 crores. This figure is based on the estimate that it is 200 crores.

10,228. The amount still outstanding, not required for circulation, is probably round about Rs. 300 and 350 crores?—As a maximum it is 200.

10,229. Then the estimate of the amount of rupees which might be presented for conversion, 110 crores, does not seem unduly small?—90 crores of those 200 crores are in our possession. 110 crores of that 200 crores are not in our possession; that leaves 110 crores to be presented. 110 crores is the amount not in the possession of the Government at present of those 200 crores that would on a maximum estimate be presented.

10,230. If 110 crores is the maximum which might be presented for conversion, a figure which you prudently take as the basis of your calculation, is it possible to estimate a minimum?—I think the only minimum is *nil;* one does not know what will be presented. There is no minimum that one can put down. It is possible that theoretically 100 crores more have been melted down than we have allowed for, and it is possible that a considerably larger circulation than 150 crores is required by the population. In that case the only hoard in existence will be the Government of India's own hoard of 90 crores.

10,231. I understand, however, it is your opinion that it would not be prudent to undertake the obligation of the conversion of rupees immediately without having made provision in advance for being

able to convert the maximum, which is 110 crores?—It would seem to be a mistake to enter on this very big operation unless you felt certain that you would carry it through to a finish. It was however for that reason that I suggested in my previous evidence that before embarking on the obligation, India ought to have an understanding with the Bank of England and the Federal Reserve Bank of New York to enable her to be assured of getting all the gold required. She has under her own control 29 crores of gold in the reserves and the possibility of converting 80 crores, taking these figures of sterling securities, into gold. But once those run out, she is entirely dependent on the power of borrowing outside.

10,232. You will forgive me for returning with a certain amount of reiteration to this question, but I imagine it is a question upon which it is impossible to be too clear for the purpose of our deliberations. Let us, therefore, be perfectly clear that, in your opinion, although this be a maximum figure of 110 crores that might be presented for conversion, it would be imprudent to embark upon a policy which would involve the undertaking of a legal liability to convert rupees into gold without seeing your way to being able to convert the maximum amount of rupees which might be presented?—The maximum?

10,233. This maximum of 110 crores?—Yes, I think it would be unsafe to embark on the operation unless you saw ahead the possibility of dealing with the maximum figure you regard as within sight.

10,234. Referring to the point upon which you last touched, it is said by Mr. Denning in his memorandum at the end of paragraph 18; "it would probably be necessary to enter into arrangements with the Bank of England and the Federal Reserve Bank of the United States of America, in order to reduce the disturbances in world prices to a minimum." I remember on our previous discussion asking you a general question as to what was the nature of the arrangements which you had in contemplation. I think upon that occasion you felt some difficulty in saying in anticipation what the arrangements which you proposed should be. I do not know whether it is possible to cast any further light, for the information of the Commission, upon what the general outlines of any proposal which you would contemplate making with the Bank of England and the Federal Reserve Bank would be in order to reduce the disturbance in world prices?—The necessity for some kind of negotiations arises in the first place because India wishes to convert a very large amount of sterling securities into gold; that means a drain on the Bank of England gold reserves and in view of the old relations between the two countries and the services which have been rendered to the finances of India by the City of London, it will be rather imprudent, to put it at its lowest, to attempt to convert 80 crores of sterling securities into gold without some discussion with the Bank of England as to its effects on the British market and the reactions on India which might be serious. India does not want to destroy her credit in the London market by doing something of this sort arbitrarily and even it she did, it would not be in her interest to do so, because the effect must necessarily be either to drive England off the gold standard or to cause an appreciation in gold unless the Bank of England can turn round quickly and make some arrangement with America. Moreover, the Government of India has not in sight a sufficient amount of gold even after it has sold all those securities to carry the thing through to completion. It must, therefore, contemplate as a possibility that, in order to obtain the maximum amount of gold required, it will require some temporary external credits which must inevitably be either in America or in England. If it is going to hope for any reasonable success, it must consult the Bank of England and the United States Federal Reserve Board in advance before it embarks on the scheme as a whole. Then, of course, there is the third point, namely, the sale of silver.

10,235. Granting the obtaining of those credit of course it is not a matter of right?—Not a matt of right. There is no reason why either America England should lend anything to India, and of cour there are maturing debts of various kin coming on. But still the last thing that shoul he risked by India will be to antagonise the London market so that she would be neither able to borrow the extra money to carry this scheme through if she does require to borrow nor be able to refund or reborrow the amount required to meet the various existing obligations that will come in the course of payment. Obviously it will be very disadvantageous to everybody if that sort of thing be done by India. Then there is the third point, that the proposal involves the sale of 600 or 700 million ozs. of silver at the maximum which very much interests the money markets of the world and the countries with a silver standard and silver producing countries. What I had in mind was that before India could embark on the scheme and before she proceeded to liquidate her sterling securities, she should enter into counsel either with the Bank of England or the Federal Reserve Board or both so as to fortify in advance with some arrangement for a credit, not necessarily to be drawn upon, both with the Bank of England and still more important with the Federal Reserve Bank of New York on which she would draw as and when she requires additional gold over and above her available reserves. She would draw on one or the other according as the Bank of England or the Federal Reserve Bank were willing to encourage the outflow of gold.

10,236. That is, in substance, drawing on the security of her silver?—It would really be on the security of the silver. But it would be a temporary advance as I said. It would not be a permanent addition to her debt but a temporary one pending the time when she would be able to liquidate her silver and buy gold.

10,237. The temporary advance being liquidated by the sale of silver?—One feels that a credit of something like 150 million dollars in New York with 80 crores of gold securities in London would be a useful thing to have before you decide to embark on the scheme as a whole. It does not at all follow that you would necessarily draw the whole of that credit. Of course the amount of gold required might prove to be less; but it is probable that you would draw some of it from New York in order to equalise the drain of gold from New York to India rather than make it all come from London.

10,238. Then, as I understand it, the nature of the arrangement which you would make is complex. There is, first of all, an arrangement which would seem to consist rather in the nature of an explanation of the policy of India in order to prepare the minds of the gold centres of the world with the circumstance that India was going to sell a certain amount of securities and draw her gold?—Yes.

10,239. Secondly, there would be a frank explanation between the authorities in order to avoid any difficulties in the renewal of India's maturing liabilities?—I only mentioned the existence of those as being a reason why you should not go ahead with this plan without consultation.

10,240. There is a possibility of trouble if the authorities were to get at arm's length?—Yes.

10,241. Thirdly, and possibly the most important consideration in this connection, is the necessity for fresh credits to cover the balance, which would be frankly a matter which the money markets of the world, represented by the various central Banks, might be willing to grant or refuse to grant?—Yes.

10.242. It would be necessary to obtain their cooperation in order to secure the fulfilment of the policy as regards fresh credits?—Certainly.

10,243. The fresh credits being credits which would he in part or in whole liquidated by the realisation of the sale of India's silver?—Yes.

10,244. The only point which is perfectly clear in this connection is that the first of the two are matters which India may expect to carry out as of right; but the second, the obtaining of fresh credits for the fulfilment of any such policy, is a matter in which India, in common with any other nation, has got no position to claim the credits as of right?—India has an absolute right to do what she likes with her own securities. It may be unwise to do a particular thing because the results may be very damaging to herself; but, as a matter of right, India has the right to sell those securities.

10,245. As regards the third heading, the heading of obtaining fresh credits in order to cover the demands necessary for the fulfilment of the policy, that is essentially a matter of negotiation, in regard to which there are equal rights on either side, debtor and creditor: they go together?—The borrower has no right to borrow; but if the creditor chooses to lend, it may suit the borrower to borrow and *vice versa*.

10,246. The next question, which I remember asking you before, is one of primary importance, and it may not be wholly irrelevant or impertinent to consider it just once more, and that is the question: What consideration would India carry in her hand in order to induce those who have gold in the world's money markets, in the gold centres of the world, to agree to granting fresh credits which would have the result of the withdrawal of gold from those centres in India?—Well, to begin with, the City of London prides itself on always carrying out its obligations, of being able to stand against any difficulties. Now we say that the time has come when we want no longer to hold this sum now held in the London money market and we want to turn it, or some of it, into gold. You have been our bankers for many years; now are you going to turn round and say if we ask for gold you will refuse it? I think that India has the right to look for goodwill at any rate to the City of London in enabling her to carry out this operation. But the claim of India is very much stronger than that. It is that India would be able to say, very rightly, that the economic development of India is a world interest of very great importance. By helping us now you could greatly speed up the economic development of India; assist her in her progress economically, not only in a narrower sphere of gold, by being able eventually to secure an economy of gold, but also, by getting India as a partner in the world's trade, in the world's money markets. That is an argument directed to the world in general. It is a particularly strong argument, I think, for England, for I believe that the economic interests of England and India are identical, that England hardly has any greater economic interests than the economic progress and prosperity of India, and if England and the British Empire and the United States can be convinced that, taking a long view, this operation will conduce to accelerate very largely the progress of India's economic prosperity, then I think that that is an argument which sound people in those centres would listen to and if they were convinced act upon very readily.

10,247. If it is not inappropriate to say so, I have finished my questions where I began. I have just two questions on which I should like to ask for your opinion to clear up matters in regard to evidence that has been given to the Commission. It has frequently been suggested to us in evidence that the introduction of the availability of gold for currency would so increase confidence that all the gold needed for the carrying of this policy into effect would be furnished by gold hoardings already in the country. Do you think that that is a possible consideration?—I am afraid, optimist though I am, I regard that as almost incredible. I do believe that the effect of introducing a gold currency will after a time be to reduce very largely the amount of gold hoarded in India, but I am afraid its first effect will be very largely to increase that amount.

10,248. So that the practical outlook is to contemplate the necessity of providing an additional output of gold, in the first place at any rate?—At any rate I think that whatever view you take of the probabilities it is important that you should not embark on this operation without having regard to the possibility; and the possibility certainly is that you will need this large amount of gold. At the same time I regard these figures as maxima; they would not in all probability be approached even nearly.

10,249. It has been frequently put to us in evidence, if I may say so somewhat vaguely, that India, having a trade balance which is habitually in her favour, can get all the gold needed for the carrying into effect of this policy without more ado than by natural processes and without expense. Do you find anything intelligible in that view?—India is of course taking a very large amount of gold. Imports of gold from other countries reach her at present in payment of her trade balance. I do not quite understand the meaning of the claim that she could get it all by merely using her trade balance. I believe she could if she were prepared temporarily to borrow but I do not think that you could embark on this proposal without running very great risk that you would so turn the balance of trade against you that you would not be able to complete it within the time proposed or at all unless you have some arrangement for borrowing abroad temporarily.

10,250. I would like your opinion on a question, the answer to which is a foregone conclusion in view of your last answer; but nevertheless it might be useful to have the reply in black and white in view of the evidence tendered to us. Are the present reserves sufficient to enable the full obligation to convert rupees into gold to be undertaken forthwith?—I think the answer is yes or very nearly so; except for the fact that there are 90 crores in the existing reserve of silver which you cannot liquidate rapidly, and you must contemplate having to borrow in order to liquidate that silver and to liquidate the other silver which you would get from the public when you offer gold in place of it, they are probably sufficient, the actual amount is enough but it is not in the right form.

10,251. Hence your final calculation that the ultimate cost of your scheme would be practically negligible, although there would be a cost during the transition stage?—Yes, that is partly, of course, based on my view that the existing reserves are rather more than sufficient for the existing sterling exchange standard system. You start with a surplus.

10,252. I understand it is your opinion that the ultimate reserve which you would have to hold under the scheme which you have outlined would need to have less real assets than there are in the reserves at the present time?—Yes.

10,253. That, as I understand it, is not because the liabilities would be less under that system, but because the assets are at present in excess of what they need be?—Both. Under the gold standard system I think the liabilities of the reserves would be less owing to the fact that you would have replaced the rupees in hoards by fully valued gold; but the main point is undoubtedly that I think the existing reserves are somewhat unnecessarily high.

10,254. To the extent outlined in your proposals in the final memorandum on the Indian Currency system?—Yes, it is indicated there.

10,255. (*Sir Maneckji Dadabhoy.*) Sir Basil, your conclusion, then, is that we should not undertake the obligation of conversion till we are absolutely satisfied that we are prepared to meet the full demand of 110 crores?—103 million of sterling, yes.

10,256. (*Chairman.*) 137 crores.

10,257. (*Sir Maneckji Dadabhoy.*) Yes, 137 crores. And I understand you to say that you are very doubtful that we shall be in a position to obtain this amount of gold. Have you any reason to suspect that the attitude of the United States Federal Board will be hostile to India?—I do not think I expressed

the view that it was doubtful. What I expressed was that it was a formidable proposal. I think I did express when I was speaking in evidence here before the opinion that while the expert authorities both in London and America would probably agree fairly readily that in theory this amount of gold could easily be spared so far as the gold was concerned, they would feel at the same time that the task of persuading their general public that the amount could be spared without damage to the currency system would be a very formidable one.

10,258. Is not America already a little bit embarrassed by her hoards of gold?—Well, there is more than one party. There is a party that holds she has too much gold, and there is a party that thinks nobody can have too much gold; it is the same here.

10,259. But as you stated that the economic development of India is a world question more or less, the whole world is interested in it; is not America likely to view the question from a sympathetic point of view?—I think that argument would meet with a sympathetic response in many quarters, but the silver position has to be considered too.

10,260. You stated that our demand would probably antagonise the London market?—No. But I say that certainly the man in the street would be rather alarmed.

10,261. The man in the street, but the financial magnates and others would take a different point of view, and look upon it as a whole Empire question?—Many financial magnates are also in this connection men in the street. I was thinking of the authorities in the Bank of England, and I think they would recognise the true position.

10,262. What are your main difficulties in the matter of acquiring credit abroad? Our financial position in this country?—It is not that we could not quite easily borrow 30 or 40 million sterling at the present time or borrow the equivalent in America for the purpose of expenditure on imports into India other than gold but I think that obviously before they agree to any such loan the Bank of England authorities will have to consider what would be the effect of that on the market, whether they could lend that amount of gold; it is the nature, the purpose for which the loan is required that creates the difficulty.

10,263. It is the nature of the demand that creates the difficulty?—It is the purpose for which the credit is wanted that causes the difficulty.

10,264. But all the civilised countries now-a-days have adopted a gold standard and I suppose if they find that India wants also to adopt a gold standard, it would be a legitimate aspiration. Why should that purpose be misunderstood or misconstrued in other parts of the world?—You say all the civilised countries of the world have adopted a gold standard. All of them tend very largely, as I was saying this morning, towards the adoption of an international exchange standard with gold as the standard of value but not as the medium of circulation. The reason there would be objection, one could anticipate objection being made to a loan to India for the purpose of buying gold, would be that it would seem to the lenders that the loan was going to be taken out simply in gold, which was going to be buried, if one may put it so, in India, not going to be available for the support of the world gold standard in future but going simply, after having been dug up at considerable expense in South Africa, to disappear again into the ground in India.

10,265. Then as regards our internal resources, Sir Basil, I fear you are a little bit too nervous. You will admit this much. There are large hoards of bullion in the country?—Yes.

10,266. Are you in a position to estimate them?—No; I wish I was.

10,267. Now once the idea prevails in the country that gold could be easily acquired for silver, would not these large quantities of hidden bullion come out very readily?—I think that the holders of those large quantities of gold bullion would require a year or two or 3 or 4 years of ocular demonstration of the of the capacity of the authorities to give gold for silver at will before they would allow any important quantity of gold to come out of that hoard. If that be so the whole of the demand would come in the earlier part and would get no assistance from gold coming out of the gold hoards in the country.

10,268. I quite understand your point of view; but will the demand in the first two or three years be so egregiously large that it would simply embarrass our position so that we wouldn't be able temporarily to meet it from the gold in our possession?—My assumption is that you need 103 million sterling extra gold within a short period.

10,269. What period, how many years?—That is one of the difficulties of the case. It may be 2 or 3 years. We have assumed that the whole would not come in within less than 10 years, but the greater part would come fairly soon. You need 103 million extra gold and the reserves we have got for foreign exchange purposes are not quite adequate to supply that. That is assuming of course the normal import into India of gold that already goes on; this is a condition of it; it is a very heavy temporary drain on the foreign exchange, the external exchange reserves of India.

10,270. You are aware, Sir Basil, in 1924 79 crores of rupees worth of gold was imported into India?—Yes.

10,271. What has become of that huge quantity of gold?—I think quite a considerable part of it has probably been used for releasing rupees from hoards and replacing them by gold; there is some evidence of that in the statistical record regarding rupees. Some of the people who have hitherto hoarded rupees finding gold so cheap paid out their rupees and took in gold in its place. As far as the rest, it is the same question as before, "Where does the gold that comes to India go?" It spreads all over the country in small quantities, in the form of bangles and ornaments and small bars and so on, and it is very hard to say to what extent it is in ornaments or to what extent it is hoarded up, or to what extent it is simply the equivalent of money in the pocket.

10,272. As you know, during the last ten years an enormous quantity of gold has been imported into India and that must exist in some shape or other, in the shape of bullion or in the shape of ornaments? It must exist?—Except in so far as it has crossed the land frontiers, which is not a very large amount.

10,273. I do not think that any large amount has crossed the land frontiers: so that, if all that gold exists, and if the idea went round immediately that gold was available freely in the country, do you not think people will not only cease hoarding of gold but they will also freely bring out the gold they have and put it to more useful purposes instead of hoarding it and keeping it stagnant without earning any money on it? Will they not say "we will put this in securities and get something on it"?—If you could persuade one or two of the very large holders, whose names are probably in our minds, to pay out a large amount of gold and take in exchange gold bonds, then you would enormously simplify this problem; but I agree that the ultimate effect on these people will be to make them bring out their gold and use it for investments. It will not however happen in the first year or two, and it is the first year or two that will present us the most difficulty.

10,274. You are aware that there is an apprehension, rightly or wrongly, in the minds of the uneducated people, that whatever gold can be imported by outside agency, apart from that, there is a tendency on the part of the Governments of European countries not to allow India to obtain gold, and the very existence of that idea strengthens the mischief in this way?—I think you are putting in one form what I have said in another, that I believe that the introduction of a gold currency would increase the confidence of the people and lead to investment.

10,275. (*Sir Reginald Mant.*) Sir Basil, there is only one point that I want to discuss with you in this connection: the main obstacle to the immediate introduction of a gold currency is the surplus stock of silver rupees in the Government treasuries and in hoards?—Yes.

10,276. The Chairman suggested to you that in lieu of the scheme propounded in Mr. Denning's memorandum for selling off that stock of rupees, it might be advisable, as I understood to postpone the operation and trust to the absorption of rupees for currency purposes: and I understood you to say, correct me if I am wrong, that you thought that it would be more economical to sell off the silver than to wait for the absorption of the rupees?—If I may summarise what I think I said, it was that the object of the introduction of the gold standard with a gold currency was to secure confidence and increase the banking and investment habits of the people quickly. It is hardly worth while doing that, if it is postponed for a very long time, particularly in view of the fact that the currency system which you are suggesting, namely, a gold standard, is not the best possible currency system but only a step towards it. From the point of view of the true economic interests of India therefore it is worth while incurring the capital loss involved in selling the rupees now rather than waiting for the future. It is also, I think, more economical because, as worked out in my plan here, the actual cost to the budget of the Government of India is somewhere in the neighbourhood of a crore at the most, whereas the proposal for accumulating interest on the gold standard reserve in gold year by year itself costs something like two or two and a half crores, a year.

10,277. You do not mean that, looking at the problem solely as one of the disposing of the surplus silver, it would be cheaper to sell it off than to hold it?—No, that was not the point: that you simply must sell the silver, but that you must incur the loss which is involved in having the surplus silver on your hands.

10,278. I have been looking at this table of absorption of currency (Appendix III to the Historical Memorandum:) and I find that in the ten years beginning with 1899-1900 (leaving out the first year because it was a year of reaction from a famine year) up to 1908-09, the average absorption was a little over 5½ crores and in the next five years immediately preceding the war the average absorption was about 8¾ crores. Then we come to the war; there was a very large absorption of rupees during the war and immediately after it, and then a reaction. But taking the average of the last eleven years in that table there was an average absorption of over ten crores a year. That seems to show that there is a steady increase in the demand for rupees in India?—Yes; I think it is rather advisable in considering these tables to ignore the war years almost entirely, except for one purpose, and that is, to remember that they saw a very considerable rise of prices and an enormous issue of rupees which has created a very large surplus of rupees as compared with the requirements temporarily, which has not yet been worked off. There is undoubtedly a regular demand for rupees year by year; but it is rather striking that if you take last year, 1924-25, which was a year of very active winter trade, this absorption was only 3·65 crores.

10,279. But at the same time there was a very large absorption of gold?—Yes; that is of course the position; if there is a large absorption of gold the pace at which the rupees will move off will be a very slow one.

10,280. India has been rather starved of gold, and I think we may treat it as abnormal?—Yes.

10,281. And we may expect a resumption of the normal demand for rupees?—Yes; I think Mr. Denning has somewhere assumed something like eight or nine crores a year as the average absorption.

10,282. That is a moderate estimate almost, judging from this table: it might run to 10 crores or considerably in excess of 10 crores? Looking at the problem simply from the question of the most economical way of disposing your silver, would you not agree that it would be more economical to hold it until it was required for currency purposes than to sell it, putting on one side for the moment your argument that it would be desirable to convert it into gold?—Quite apart from the question of the introduction of the gold standard, whether it would be desirable or not to sell some of the silver in the reserve: That is a problem that I have had in my mind ever since I came out to India, as to whether we were not rather wasting money in holding this very large stock of rupees with no prospect of their being required within a reasonable period, and I think the only reason why I have not made any suggestion for dealing with them was because one felt that there was a general currency inquiry coming on and the question would have to be taken up then; but I am inclined to think that it would be economical now to sell a small portion of those rupees and take the loss involved and use the proceeds for investment with the result that such investment would more than make up for the loss incurred in selling the rupees.

10,283. You have not worked that out mathematically?—No; not exactly; but I have worked it out in various ways; your difficulty would be what price you would buy silver at when you want to issue it later. If you estimate that you can buy silver later at the price that you sell it for now, then it more than pays you to sell. But the question as to how much higher price you have to pay when you do buy is something in the nature of a speculation.

10,284. If you started selling silver, you would depress the market and when you came in again it would go up?—Yes, that is our difficulty.

10,285. So on the whole I gather you do not hold that it would be economical or rather it would be doubtful economy looking at the question as it stands at the present moment, not to sell off and trust to absorption?—It is a matter on which you have got to take so many views; the future price of silver, the effect of sale of silver now, the capital loss that you incur by selling the surplus stock of rupees and various other things. I think my own view is supposing nothing else were being done by this Currency Commission except continue the pre-war system, I would then take up the question of selling off some of the surplus silver, and I think I should probably recommend their sale.

10,286. At present you treat it as an open one?—Yes.

10,287. (*Sir Purshotamdas Thakurdas.*) I take it, Sir Basil, that you would like this Commission to recommend this scheme for improvement of the existing currency policy as one which will go through successfully and which has the least risk of breaking anywhere midway?—Yes.

10,288. To that end, you suggest that arrangements should be in view for getting the amount of gold which may be considered necessary in order to see the scheme well started?—Yes.

10,289. And you suggest that the maximum quantity of gold that should be available in case of need is 103 million pounds sterling?—Additional gold, yes.

10,290. That is the figure in Mr. Denning's memorandum and you just now said "additional gold." In paragraph 12 of Mr. Denning's memorandum, I see this: "The bullion merchant, however, would obtain his gold from Government instead of importing it." Does he not include the requirement of the private importer in the 103 million gold?—No. Well, the answer is perhaps not a simple "no." 103 million pounds gold represents the amount of gold which would be required to be imported into India over and above what is at present being imported for the purpose of converting rupees hoarded by the Government or by other people.

10,291. By the Government?—90 crores into gold.

10,292. Oh, the 90 crores conversion is also covered by this 103 million?—In so far as it is required. We

don't propose to convert the whole of it into gold. Some of it into gold securities.

10,293. May I get a little more clear about that?—137½ crores of gold is the amount that is required to bring up the gold reserves of the currency at the end of the period to the minimum figure estimated to be safe and in addition to provide what we expect to go into circulation in place of rupees and the gold that we expect to go into hoards in place of rupees in hoards.

10,294. I want to understand that. I understood that 103 million gold or the equivalent of 137½ crores rupees worth of gold was required, and you add 110 crores of rupees which you expected to come out of the hoards to be tendered to the treasury for conversion into gold?—A hundred crores to come out of hoards and ten crores to go into circulation.

10,295. That is in paragraph 18 of Mr. Denning's note?—And 27·2 crores as an additional reserve.

10,296. Yes. What Mr. Denning calls "the addition to the amount of gold at present held in the paper currency reserve"?—Yes.

10,297. You just now, I understood, said that that also included conversion of 90 crores in the Government treasury?—In so far as the silver to be sold includes the 90 crores of silver in the Government treasuries. Our estimates is that that may be worth 45 crores of gold and that it would therefore more than pay for the 27 crores of additional gold which we require. I want 27·2 crores out of that 90 crores. Instead of holding silver in future one would hold gold in the reserve.

10,298. Would you mind explaining how you will be able to buy the gold? I am thinking of the quantity of gold to be imported into India?—May I repeat the answer then. You put it perfectly correctly just now. What is required is 137·2 crores of additional gold, of which 100 crores is to replace silver in hoards, 10 crores is to replace silver rupees in circulation and 27·2 crores is to add to the gold reserve in the paper currency.

10,299. The 90 crores is outside and if it is decided that the 90 crores should not be at present converted into anything but should be retained as rupees, they would not be included in this?—That does not alter the amount of gold you require. It affects the way in which you purchase.

10,300. You expect then only 10 crores of rupees to be converted from rupees in circulation?—That is the estimate, yes.

10,301. And you are counting on 100 crores of rupees to be offered to the treasury for conversion out of rupees in hoards?—Yes.

10,302. The whole figure, therefore, or more accurately, the major part of the figure therefore consist of what I hope you will agree is a mere guess as to what is the amount of rupees in hoards?—Yes. We have frankly said that we are not in a position to guess what the amount is. We are in a position to give some statistics to show what its maximum figure is and this figure is in our view the maximum figure.

10,303. All these figures, I take it, are maximum figures—outside maxima?—Yes.

10,304. Now, if I remember it correctly, Sir Basil, Mr. Denning said in one part of his memorandum, in paragraph 12 of his memorandum, that it would be possible by special arrangement with Indian States to postpone the conversion of their rupees in hoards, if any?—Yes.

10,305. So, in spite of this possibility, you think that 100 crores will have to be converted?—No. If that possibility materialises, I think it would reduce the 100 crores.

10,306. And your assumption is that the States hold the majority of the rupees in hoards, or is it the masses that hold the bulk of the hoards?—I believe that there are some very big hoards mostly in the Indian States, which consist of British India rupees, but that probably the majority of the rupees that we are talking of, if they exist at all, are the sum of a large number of smaller hoards.

10,307. Smaller hoards with the masses?—With the masses, yes; including hoards of 80 or 100 lakhs with individual banias and things of that sort.

10,308. A hundred lakhs, that is a crore, with some private individuals?—I heard of one the other day; I don't know if it is true.

10,309. The estimate of 100 crores of rupees being in hoards is of course only justified by the one that you give of Rs. 5 per head of the population being the rupee currency in circulation?—Yes.

10,310. In view of the various special circumstances regarding the people here, namely, want of education, some of the climatic handicaps, the long distances, and the want of facilities for encashment, do you think Rs. 5 is not too much on the low side?—It is meant to be a low figure.

10,311. Oh, you purposely kept it a low figure. Then it is possible that these 100 crores may turn out to be an extravagant over-estimate?—Certainly.

10,312. Now, Mr. Denning's scheme for a gold standard is divided into 4 stages?—Yes.

10,313. Do you think provision for all this quantity of gold should be made before a start is made or do you think that it should be made as we pass on from one stage to the other?—Your difficulty is the same difficulty as what we were speaking of a little earlier, that it is impossible to foresee at all accurately what would be the effect upon those who are at present holding their store of value in the form of overvalued silver rupees of an announcement that in future the real store of value in India was going to be gold; and so long as that is the case you cannot say whether the whole of this demand for gold may not come very quickly indeed.

10,314. Sir Basil, but that stage does not come on until the very final stage?—No, but I assume that, if the Report of the Commission took the form of recommending that this proposal should be brought into operation in four stages, and stage 1 was introduced, intended to lead to stage 2, and 2 to 3, and 3 to 4, and if people took fright and unloaded their rupees at the first stage, you may have your full demand at once—I don't say you would have it, but you have to protect yourself against a risk of this character.

10,315. But, as you yourself suggest, any such announcement would have to carry with it a sufficiently long notice?—Oh, I was speaking then of the taking away of the unlimited legal tender character of the rupee. You would not announce any date for that. All that would happen would be that the Government would presumably accept the Commission's Report suggesting an ultimate stage possibly ten years hence for the disappearance of the legal tender of the silver rupee.

10,316. Exactly. And in acceptance of that, Government would perhaps think it necessary as you said in reply to the Chairman, to see that a sufficiently long notice is given of its intention when this date is fixed. Do you think that, in spite of this, the people of India would rush for gold at the very start?—I don't profess to know. But I think you have got to prepare for their doing so.

10,317. Even at the first stage?—Well, you need not necessarily at the first stage have actually in hand or in sight the whole of the 100 crores, but you do want to know that you can put your hand on it before the end of the stage.

10,318. Or do you want to know beforehand that you have got the goodwill of America or England in this matter. Would not that be enough? I mean if you did that by making sure that they would not be opposed to it, if you had an agreement in principle that they would assist you. I thought if you had general sympathy from them to this?—But I should be happier in dealing with a banker to be dealing with something more than an agreement in principle.

10,319. Even though you felt that the agreement might cost a good deal?—I don't think the agreement would be necessarily costly. I am much more concerned about the difficulty of getting an agreement than with the cost.

10,320. I thought you were going to tell us something regarding this in Mr. Denning's memorandum, in paragraph 12, where he says "the bullion merchant, however, would obtain his gold from Government instead of importing it." You said of that, 103 millions is extra gold. But it includes some of the demands of the buillion merchants?—The assumption is that 103 millions is extra gold. The normal amount of gold would continue coming in to India as it does now, irrespective of this extra demand. That normal demand might go on as at present on the money market without going through the currency reserves, or it might go through the currency reserves, but it does not affect the total required by the Government or the total of the extra gold required, whichever form it takes, whether it goes through the money market or adopts the new form of going through the currency reserve. Do I make myself plain? The gold would go on coming in, but it might be brought in by the exchange bankers and presented to the Government in exchange for notes and the bullion dealers might buy their gold from Government so that the gold would go in and out or it might be bought by the bullion dealers direct from the exchange bankers.

10,321. You mean instead of their importing it, as they do at present, direct?—Yes; go through the Government.

10,322. But why should there be any change in the method of importation by the private man?—Because you have introduced a new system under which gold can be got direct from the Government. It does not matter. This point is entirely irrelevant so far as the total of the gold required is concerned. It does not alter the position of the Government.

10,323. The reading of paragraph 12, gave me the impression as if that was included, but now you say that it is outside?—This is in addition to the normal demand of India.

10,324. When the Government gave out sovereigns at their option from 1901 till about the war time, the consumption of sovereigns by the public was not anything big?—No.

10,325. It only worked out to 7 crores a year?—I have not got the figure in my head; I have no doubt that is about the figure.

10,326. The absorption of sovereigns from 1901 to 1912-13 was 60 millions in all, with exchange at 1s. 4d. as it then was, that is, it was 7½ crores. Why do you think that the people would now take more gold?—I think that my assumption is that for currency purposes they would take even less gold than they did when they got the sovereign for optional circulation. I have also expressed it as my opinion that once you go through the initial stages the actual demand for gold in India would be reduced. It is this initial stage, the special inducement that you will put forward to the holders of overvalued rupees, not for circulation but for hoarding, to convert their hoards into gold. If you can get rid of that liability, I agree there is nothing in it.

10,327. Would you call the initial stages the first two stages or all the four stages?—I do not refer to any of these particular stages but the initial stage of acquiring the rupees out of the hoards and substituting gold for them.

10,328. We are in the realm of guesses?—Yes.

10,329. (*Sir Purshotamdas Thakurdas.*) Now regarding the quantity of gold and the possibility of our having it and the possible attitude of America towards it, I was reading the other night a speech delivered by the Right Hon. R. McKenna before a Committee of Members of Parliament (it is in the Monthly Review of the "Midland Bank Limited" for February-March, 1925, and I would like to read this part from his speech):—"So far as I am able to judge, I should say that the supply of gold at its present value is more than sufficient to meet the world's demands and that consequently we shall pass into a time of slowly rising prices, more active trade and increased employment. The world's output today is about £80,000,000 a year at par value. There is accumulated in the Federal Reserve Banks of the United States an excess of upwards of £300,000,000 over legal requirements. A considerable demand has of late been made from India, Germany and Australia, but these three countries cannot absorb anything like the total output. The demands in other countries will probably be quite small. . . . . gold will come to this country without our being obliged to attract it by high money rates. . . . ."

10,330. (*Chairman.*) What is the date of the speech?

10,330A. (*Sir Purshotamdas Thakurdas.*) The date of the Review is February-March, 1925, I cannot say what is the date of the speech, it is a speech before a Committee of Members of Parliament. Mr. McKenna stated that the particular question had long occupied the attention of Members in the House of Commons and that he was greatly honoured to be asked to speak on this subject; that is why I said that it was a speech before some Members of the House of Commons. So this does not show any great difficulty about it?—There are a good many views in the world to-day as to the future course of gold prices. Professor Cassell is very seriously concerned about the shortage of gold in the world. There are then some people like Mr. McKenna and others, for whose view there is a great deal to be said, who hold the contrary view that there is rather more gold than is actually required to support the present basis of credit. My safest course is to leave it at that.

10,331. I was wondering whether in view of this sort of statement from a person like Mr. McKenna one may not conclude that there should not be any difficulty of getting gold from either America or through London provided the case of India is put before them in the manner in which you suggested?—It provides the advocates of the cause of India with a strong argument for assuring themselves that there are people who hold that it could be done.

10,332. (*Professor Coyajee.*) There are a few arguments for the gradual introduction of the Gold Standard which I desire to put to you. In the first place, with gradual introduction, no sudden and great demand would be made by India on the world's stock, and the difficulty of large borrowings of gold as pointed out by you would be avoided, because we should be bringing in the interest on the paper currency and gold standard reserve securities in the shape of gold for some years, say 8 to 10 years, and therefore we would not have the difficulty of large borrowings of gold to carry the policy through?—If that is what is really meant and if the interest on the paper currency and the gold standard reserves is to be entirely devoted to the purchase of gold, it involves a charge of 4 or 5 crores a year on the Budget. That is one difficulty.

10,333. Then another argument is that during this period of transition say of a decade, a trial could be given to an improved gold exchange standard, or, on the other hand a shorter and quicker line of advance could be found towards an international gold exchange standard. Is that an advantage?—I think I can agree with that in the form in which it is put.

10,334. Thirdly, we could benefit by the lessons of currency developments and methods of introducing a gold standard and conducting them in western countries?—I think we are in a position to do that even without waiting for two or three years. One argument that does seem to be an important one is that there is at the present moment a large surplus of gold in the United States of America. It ought to be easier to get that gold for a special purpose now when it is surplus to the requirements of one country than it would be to obtain gold after gold has become evenly distributed all through the gold reserves of the various countries.

10,335. (*Mr. Preston.*) Assuming that as soon as gold could be obtainable without touching the gold in our present reserves and taking into account the long time that a gold mint would require to come into operation and the slow progress of minting gold coins, would you consider a period of 10 years as early a date as possible to accept the full liability of a

gold standard?—I think that there are several assumptions there which I would not assume. But I certainly think 10 years is a quite reasonable period.

10,336. You think 10 years would be quite a reasonable period?—Yes.

10,337. Now assuming then that we adopt the method that you yourself suggested this morning that whenever additional currency is required beyond the actual amount of the home charges and which you thought might on an average be about 5 million sterling a year, if in addition to that you were to add an equivalent equal to the 10 crores of local Hundi currency that you create?—What is the amount now, 12 crores?

10,338. Would it be a fair assumption to say that taking the average period of the next 10 years the yearly accumulation of gold would be 7 million sterling?—I do not think you can take the Hundi emergency currency into the calculation because the whole purpose of that special provision is that the currency should be additional emergency currency created against self-liquidating securities and should be automatically self-liquidated shortly after. It does not in itself envisage any addition whatever to the permanent currency of the country. You must therefore leave that out of account. I think 7 crores a year as an addition to the currency is probably a high average. I should not like to commit myself without a little more thought but five is not unreasonable.

10,339. Let us take 5. You say that 10 years would be quite an early period. Under your assumption then that would give us 50 million sterling in addition to that and owing to the slow progress which in my opinion the Mint would take in turning out coins, we could very readily arrange a credit in the City of London for 10 or 20 million sterling on the surplus silver reserves you have got in India?—So far as our credit is concerned I think we could very easily obtain credit either in England or in New York at present on the I.O.U. of the Government of India.

10,340. I am not speaking in the ordinary sense of a sterling loan to be raised in London. I am speaking more of a private credit to be arranged by Financial Houses and Banks?—I do not think there is any difficulty about the credit of the Government of India or its power to obtain for a purpose which is approved a loan either in London or in New York.

10,341. (*Mr. Preston.*) We have been in close touch, with Financial Houses during the last few years who provided finance for countries on their silver reserves pending the sale of the silver in London by means of six months' bills, and it has been very cheap finance to them; and the Government of India, if they were merely to express their desire, not as against the sale of the silver, but merely pending the bringing into operation of the gold standard and ask whether a credit on that basis could be arranged, there would be asolutely no difficulty. That I feel certain.

10,342. (*Chairman.*) Sir Basil, you have something to say on that?—I accept the general statement; I think from the point of view of the strength of the Government of India's credit either in London or in New York there are no very great difficulties in arranging on very reasonable terms an external credit for a reasonable amount for reasonable periods.

10,343. (*Mr. Preston.*) I was merely desiring to get your opinion as to whether you would agree in principle with such an operation?—I should have to consider whether it will be the cheapest way of Government obtaining the money. Subject to that, I would agree.

10,344. I am looking at it from the point of view of addition of the accumulation; so that the accumulation there will be, the accumulation of 5 millions *plus* the 20 millions which we can get. Would that appeal to you as it stands?—If we can persuade the authorities of the City of London and the City of New York to allow us the use of our credits for the purpose of drawing our gold, there will be no difficulty.

10,345. I don't think we need bother about going to New York as long as we can discount the bills and get the gold from London?—The Bank of England would want to know how much its reserve is going to be diverted by this operation or if it is going to be replenished and they might very well do as they did with the Australian Government this year and say that in the present circumstances we cannot afford to allow the issue of a loan in London. It is a question of the strength of the Bank of England reserve.

10,346. That was at the period when the gold standard was still in force—Granting it was just after the introduction of the gold standard, the reintroduction, the return to gold parity in London, it is exactly the sort of purpose for which a credit from New York was obtained by the British Government in case of such a demand for gold when it was introduced.

10,347 Ten years appeal to you as the nearest period; and taking an accumulation of 5 millions a year for a period of 10 years you get 50 millions and that you are in favour or you are not averse provided we could get sanction to float bills for 20 millions and as monthly shipments of about half a million sterling would be sufficient, then we need not disturb the London money market in any way?—I think that the disturbance to the London money market is exactly the same. I do not see that you are making any different proposition from what I was making unless you mean the postponement of the introduction of the system. I suggest introducing it at once. The various stages are set out in that memorandum and the final completion is as I suggested at the end of ten years, whereas your suggestion is the introduction itself ten years hence?

10,348. If your mint is in working order you could commence operations on the arrival of the first 500 shipments from London. Might it not, therefore, be well to invite the mint master to say how long it would be before the mints could undertake coinage and at what rate of outturn per day they could turn out coin?—I don't personally think that there is any check on the progress of the scheme, as regards the question of rate of turn-out of gold coin. I do not regard the amount of gold coin to be demanded as enormous. It is bullion rather than coin for which I anticipate the demand. I don't think postponing the thing for ten years would make it very much easier to introduce.

10,349. That is only allowing for a sufficient period to enable the mint to get sufficient number of coins to make this attempt?—For the purpose of accumulating sufficient amount of gold?

10,350. You say you might have a frontal attack. If from your point of view you think it would be more advantageous to give out gold, then there would be no harm in doing so as shipments of gold come forward to India. We have got to make some sort of beginning whatever system we adopt. Taking this method would that not be a quick means to a satisfactory conclusion?—I think it might be made a means to a satisfactory conclusion; but I am inclined to think that it is possible to adopt quicker methods.

10,351. (*Chairman.*) Just to take one or two points in your examination, first of all as regards the question of the world's gold prices, is that a matter about which you care to give any fuller evidence?—I don't think that the evidence that I could give would be of any appreciable value as compared with the evidence that the Commission would be within easy reach of a few months hence.

10,352. You would rather refer us to the more direct sources of information as regards the prospects of the world's gold supply in relation to demand?—Yes.

10,353. Recognising that there are opinions by authorities which are expressed in a contrary sense, as regards the prospects?—Yes.

10,354. As regards the question of the credit of the Government of India in the world's money centres, I understand you express the opinion that the credit of the Government is more than adequate to raise any amount which might be necessary to carry this policy into effect?—I believe so at present.

10,355. But nevertheless when you come to the question of obtaining financial accommodation, the lender would consider the purpose for which the credit is granted as well as the amount?—Yes.

10,356. You contemplate that it will be necessary to satisfy the contemplating lender as to the purpose for which the credit is granted as well as the sufficiency of the security?—I think that the authorities in England would be reasonably entitled to ask whether the purpose of any loan which the Government of India went to the market for in London was to take away their gold reserve and to take any steps that are in their power if they thought that the action of the Government of India was likely to damage the general position.

10,357. The intending lender will consider not only whether the security is adequate but whether there are any other complications?—The individual issuing house sometimes does not consider those; but the attention of the issuing house concerned is sometimes drawn to broader questions by authorities who are interested in them.

10,358. You point out to us that recently, although the credit of the Australian Government was no doubt more than adequate to raise a loan which it required in London, it was nevertheless, for motives of general policy, referred to other sources of lending?—Yes, for the very reason that the position of the Australian Government in London at the moment was that she in any case was going to draw gold from London and the authorities did not desire to see such an addition made to the amount of gold the Australian Gevernment could draw from London at that time.

10,359. There is only one other matter on which I want you to fill up a small gap in our knowledge on this important question of the amount of additional gold needed to carry this policy into effect. I understand that you have considered the amount of gold necessary for the conversion of hoards, for the replacement of rupees in circulation, and for the fortification of the reserves?—Yes.

10,360. What about the replacement of notes by gold in circulation? Has any allowance been made for that?—No allowance has been made for that; but if the ten crores was assumed as the amount that will go into circulation it does not make a very large difference.

10,361. Then was the ten crores meant to cover both the replacement of notes and rupees?—Yes.

10,362. Now, lastly, to exhaust any possible addition to the supply of gold needed, have you contemplated the possibility that the fact that gold was made more readily available might actually lead to an increase in the amount of gold locked up in hoards?—I don't think it is strictly true that the gold is more readily available in one sense, at any rate, during the first and second stages of the proposal. But at the same time it is the mere fact that gold is available that is brought more prominently to the attention of the people. Actually Sir Maneckji Dadabhoy was inclined to hold, if I judged rightly from the tenor of his questions, that the result of making gold more readily available would be to bring out gold from hoards rather than to take it in.

10,363. What do you yourself think?—I have assumed that in the earlier stage, it will have no effect one way or the other on existing gold hoards and that the second effect would be to reduce the total amount of gold hoarding.

10,364. You are inclined to believe that the result of making gold more visibly available will be rather to increase than to diminish the demand for gold for fresh hoards?—I would say that there would be neither increase nor decrease in the first stage. In the first stage while it will lead to gold replacing silver it will have practically no effect on the total amount hoarded and in the second it will certainly be to diminish the amount hoarded.

10,365. Now, lastly, a question which I should have asked before but which escaped my attention. I want to ask you about the mechanism suggested in Mr. Denning's memorandum for drawing gold to India, which is no doubt within your memory. It is in paragraph 13 of Mr. Denning's Memorandum on a Gold Standard for India. To what extent is it possible to feel confident that this method of procedure will actually place the additional gold required at the disposal of India for the intended purpose?—The assumption is that the operation coincides with a period of good monsoon, when India has a considerable balance of exports over imports to be covered either by Government remittances or by import of gold or by both. If temporarily you withdraw the facility for getting Government remittances, I think that the exchange banks and others would be forced to bring out gold in order to obtain currency with which to carry on their operations. I think there is no doubt as to the certainty of the effect of such operations. It simply comes to this: that Government withdraw from the market and leave a gap which is to be filled by the import of gold into India in order to build currency on it.

10,366. What is the reply to the comment that, assuming a good year in which there is a large export and flourishing trade, any additional gold drawn to India by this method may merely pass into circulation as the necessary supplement to the currency of the country required by the prosperity of trade and does not become available for the replacement of rupees?—If it remains in the Government's balances, or rather in the currency reserve balances, currency is issued against it; the position of the Government is considerably improved, and it could probably then do some remittance which otherwise it could not do and avoid external credit to that extent.

10,367. If it remains in the currency balances, notes are issued against it?—Yes; the position that is envisaged I think is that the exporter from India is exporting largely and his exports have to be paid for. The exchange banks have undertaken the liability to meet his demands for currency and they would quickly find themselves with all their balances in London and none in India if they could not sell sterling to Government. They would have their sterling in London and would not be able to meet their obligations in India. They would therefore use the sterling in India to bring the gold out. They would take the gold to the currency authorities and get currency with which to pay their Indian obligations. They would obtain their rupees in that form or alternatively they might simply sell the gold. I have not given the operation quite correctly in this case. They would sell the gold in the bullion market and get rupees for it; in that way the rupees coming in would eventually be the rupees that have come out of the hoards.

10,368. Why would it be sold?—In the latter case because there would otherwise be no currency with which to pay for the bullion to that extent.

10,369. The gold is brought to the currency authority and currency is obtained against it. Then there is a fresh outstanding form of liability against this gold held by the Government, so that the gold is not available for the conversion of fresh rupees. Is that it?—Well the proportion of gold has been increased in the currency reserves at that stage of the operation.

10,370. So that a proportion of it can be used for the conversion of rupees?—And the Government is then in the position of being able to stand any reasonable demand which may arise for conversion of rupees

into gold at the currency office without importing fresh gold. It can wait there till the rupees come to it.

10,371. Supposing the gold is sold by the exchange bank to the bullion broker and the bullion broker sells it to the public, the bullion broker receives so many rupees with which he discharges his liability to the exchange bank. What does the exchange bank do with the rupees?—The exchange bank I suppose in that case will pay them into the currency office; it will get a cash balance at the Imperial Bank I suppose.

10,372. My difficulty, which may be an unnecessary one, is that this argues a period during which an extension of the currency is necessary, and it would seem that the import of gold is no more than is necessary in order to provide for the extension of the the currency?—There is some extension of the currency. I think it is the reflection of the fact that currency which is at present in hoards has come out into use as currency again and its place has been taken by gold and rupees have come out from hoards into circulation. There is temporarily at that stage necessarily a considerable increase in the total circulation, but that must pour into the currency office because it has nowhere else to go to, and that is one of the means by which the rupees will come out from the hoards into the hands of Government where they will be surplus in the form of rupees and ripe to be converted into another form of reserve.

10,373. Once they get into the hands of Government, all is well?—They must come into the hands of Government at some stage I think because if they do not come into the hands of Government there won't be this extra demand for gold because there won't be extra rupees to pay for it if the rupees do not come out of the hoards. They must come out of the hoards in order to pay for the gold which they have asked for. If they do not come out there is no demand for bullion, and the bullion stays in the reserves.

10,374. Now turn to the other side of the picture, and that is the possibility of a bad year. If you have a bad year, with diminishing exports, so far from being able to keep the exchange above the limits of the upper gold point you might be fighting for your life to provent it falling below the lower gold point, and there would be no question of drawing gold?—Of course if the Government is out of the market for remittance it is a very improbable position that the exchange will be at the lower gold point.

10,375. It would have to be a very bad year?—It would have to be a very bad year, I think, at that stage.

10,376. And if there were two bad years?—Well we went into that matter to some extent the other day and I think the view I took was that the worst moment was when the imports ordered in a good time are coming in in a bad time and have to be paid for.

10,377. Yes, that is so. There is one question which I asked on a previous occasion on which I would like to get a clearer idea, and that is, following up all possible hypotheses, the question as to what line of action should be suggested in the case of a minimum response to the offer for the conversion of rupees into gold. This is the supposition that nothing happens. Supposing the full obligation has been accepted to convert rupees into gold and it is to remain a continuing liability, and supposing that rupees are not presented for conversion into gold, you will then be confronted, will you not, with a sort of Damocles' sword which will be constantly hanging over your head and which might materialise at the most inconvenient moment?—Yes, except if you come to the conclusion that you had overestimated the amount of rupees that was to come out.

10,378. Nevertheless a considerable period of time would have to pass before you became confident of that conclusion?—You would during that period of course, instead of having a shortage of gold in your reserve, tend to have a very large proportion in your reserve in the form of gold.

10,379. All that one can say about it is that you would be holding an expensive reserve and not deriving any benefit from it?—It would not be so expensive as if there was a tremendous demand.

10,380. What would the difference be?—You would not in those circumstances have to resort to any temporary credit abroad.

10,381. But you would have to raise the credit to get the gold into the reserve?—No, you would have to arrange credit, not necessarily to use it, because you would rely mainly in the first instance on the sale of your securities. Your aim would be during that period to keep the amount of gold in your currency reserves up to a comparatively high figure and you would take no steps to increase it specially until a demand arose.

10,382. Do you contemplate that it would not be actually necessary to draw on your credits unless and until that demand materialised?—You might have to pay something for your credits, even though you might not use them.

10,383. On the analogy of similar credits Great Britain has recently raised in the United States?—Yes; that ought to be a very small expense.

10,384. I think that completes all the questions I have to trouble you with upon this heading, Sir Basil?—I do not feel that I have given a completely satisfactory answer to the question you put as to the drawing of gold to India and its effect on the currency. I should like if I might to put in a memorandum on that point—the course of events that is adumbrated in Mr. Denning's memorandum regarding the withdrawal of the Government from the remittance market and the forcing of imports of gold.

10,385. I am very much obliged to you for the suggestion, because, if I may say so, I have decided to treasure up your answers for subsequent consideration, feeling that I have not attained perfect clarity myself in regard to some of them?—I hope my answers were correct so far as they went, but they were not I think clear. I did put it down on paper for myself at one time just because of the obscurity of the hypothesis involved.

10,386. The question about which it may be necessary for the Commission to get a perfect clarity of mind is as to what exactly would be the effect of this system in operation in a period of good trade and increasing exports?—Yes.

10,387. And how the additional forced import of gold, if one may use the word " forced " without any derogatory meaning, would operate to reduce the silver hoards. I think that would be of very great interest. I do not know whether there are any further questions that the members wish to ask Sir Basil. There are various headings we have not touched upon, and if there are any further questions to ask I believe we can have the advantage of his presence here to-morrow morning?—If the Commission desires I will be here to-morrow morning.

10,388. (*Sir Purshotamdas Thakurdas.*) I think, Sir, there are one or two points on which I should like to question Sir Basil to-morrow morning.

10,389. (*Chairman.*) It occurs to me there may be some further points which may have arisen in connection with the ratio and possibly some of us might like to ask questions about that; I have none myself. Under those circumstances perhaps, Sir Basil, it will not be inconvenient to you to be here at 10.30 to-morrow morning?—Certainly.

(*The witness withdrew.*)

TWENTY-SEVENTH DAY.

Thursday, January 7th, 1926.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*)

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER
Mr. A. AYANGAR } (*Secretaries*).

The Hon. Sir BASIL P. BLACKETT, K.C.B., K.C.S.I., recalled and further examined.

10,390. (*Chairman*.) Sir Basil, are there any particulars which you would care to add to the answers which you gave us yesterday or by way of further elucidation of those matters?—The question of the way in which the extra gold would be brought to India and what its results would be was one which I said yesterday I would like to add something to. I have tried to think it out in a way that is clear. The question was how would the operation alluded to in paragraph 13 of the memorandum on a gold standard for India really work. The assumption in that paragraph is that owing to the action of the Government in using its balances in England to meet its external expenditure the exchange banks would be in the position of having over-bought sterling and having no means of covering themselves except by importing gold into India. This import is assumed to be additional to the usual private imports. In order to get currency the exchange banks will present the gold to the Government at the currency offices for exchange into currency for circulation. This will strengthen the gold in the currency reserves and there will be an increase in the note circulation; but the Government will have been drawing on their sterling reserves to meet their charges in London, and in doing so will, of course, effect a reduction of the sterling securities in the reserve against which there will be an equivalent reduction of notes by cancellation in India, the extra gold imported being assumed to be equal to the amount of the remittances. The position will be that the sterling reserves will have been reduced by a figure which is taken in that memorandum at 46 crores over a whole year; the sterling reserves will be reduced by 46 crores, the gold in the reserve will be increased by 46 crores, and the note circulation will remain the same. All that will have happened under that assumption will be that the sterling securities will have been converted into gold. But there is another possibility. It may be, and is on the whole, likely that at the beginning of the introduction of the scheme the additional import of gold by the exchange banks for currency purposes will be sold to the bullion merchants rather than to the Government, because the Government would be charging a small seigniorage and the bullion merchants would probably give a slightly better price than the Government. The exchange banks will, therefore, sell the additional gold to the bullion merchants, who will be prepared to meet the first demand for conversion of silver rupees in hoards in that case by means of the extra gold imported. The bullion merchants will then sell the extra gold to the holders of those hoards of rupees with the result that the volume of silver rupees in circulation would be increased by the amount of the rupees that comes out of hoards. On the other hand, there will have been a corresponding reduction of notes in circulation, owing to the action of the Government in cancelling notes in India against sterling securities transferred in London from the paper currency reservo to balances. At that stage, therefore, there will be an increase in the silver rupees in circulation corresponding to an equivalent reduction of notes in circulation. The next step will presumably be that there will be a return of the silver rupees that have come out of hoards into currency offices in exchange for notes. The resultant increase in the circulation of notes will replace the notes cancelled by the reduction following on the Government remittances to London through the reserves. So the final result is that the hoards of silver rupees of the public have been reduced by 46 crores and replaced by gold, the silver in the reserves has been increased by 46 crores, and the sterling portion of the reserves has been reduced by 46 crores. That is to say, the hoards have been bought off to the extent of 46 crores, and the silver portion of the reserve has been increased against reduction of sterling. In due course the silver portion would thereafter be replaced as the rupees are melted down and sold by gold or sterling. I think that is an analysis of the position which brings out the implications of paragraph 13.

10,391. You have given us a very clear analysis. In the latter case which you have analysed, we have followed the rupees actually back into the currency office?—Yes.

10,392. In the former case we have not followed them quite so far on the supposition that gold is brought by the exchange banks to the currency office for currency. In the former case we have got as far as this, have we not, that the gold reserves of the Government of India are strengthened in proportion to the note issue, and therefore there is a proportion of gold available for the conversion of the rupee?—Yes.

10,393. But the final stage by which that gold becomes converted into rupees would still have to be taken in some form or other?—Yes; the position at that stage is that the gold in the paper currency reserve has been very greatly increased and is available for the purpose of meeting the return of rupees from hoards desiring exchange into gold.

10,394. (*Chairman*.) The Commission is now in possession of the contemplated working of the proposal. I have no further questions myself to ask you; but there are various matters on which my colleagues may still require your assistance, if you will be so good as to deal with any supplementary questions from them.

10,395. (*Sir Purshotamdas Thakurdas*.) Regarding the Genoa Conference and the arrangement arrived at there by the various powers, it has been said that the problem which the Genoa Conference had to solve

was quite different from the problem which has to be solved in the case of India: it has been said that in the case of the European problem it was a question of putting on sound footing the destroyed currencies of the major part of Europe, but that in the case of India it is a question more of bringing out the gold which is in the country but is not available for currency purposes; and that therefore the remedy suggested by the Genoa Conference would not apply and would not be a correct remedy for India. So you agree with that, or would you point out where you differ from that opinion, Sir Basil?—I think that the proposals put forward by the Genoa Conference are of universal application. The circumstances of certain of the European currencies which were dislocated at the time of the conference undoubtedly differed from the circumstances in India, but in my opinion the proposals of the Genoa Conference can be universally applied.

10,396. Irrespective of the banking facilities or the habits of the country and of the long usage or custom to which the people may be addicted for a hundred years or more?—I think so, yes.

10,397. The provision of adequate or inadequate facilities does not make a substantial difference between the two?—I think it makes a difference in the point of view of approach to a solution of the problem; but I think that the application of the general principles laid down at Genoa is the same, whether it is a country like Latvia, or Austria or Germany or India.

10,398. The goal for all the countries I take it in your opinion would be the same: but would not there be a difference in the stages by which you approached the goal?—There may be a difference in the stages.

10,399. Could you not make it a little more definite than that? Would you not think that a difference in stages is necessary?—The goal in each case is, I think, paper currency inconvertible internally but completely convertible on a gold basis for the purposes of foreign payments, the object of that arrangement being to give a perfectly stable internal currency for all the countries of the world based on a gold standard, arrangements being made to economise the gold by not having it wastefully used in circulation in the various countries concerned, but kept in central reserves, the ideal aimed at being that you might go on, from having national reserves of gold, to have something in the nature of international reserves of gold; and I think that applies just as much to India as to any of the other countries; India is quite capable of being a valuable partner in that international arrangement, just as capable as any of the other countries, and a most important partner in the arrangement.

10,400. But India could be such a partner only if India is brought to the goal in a steady manner; if any of the means adopted in that should be regarded otherwise it would be a setback to this progress towards the goal?—It is most desirable, of course, that the currency system adopted by India should be one which is generally regarded by the people of India as a desirable one.

10,401. And should be accepted by them as such?—Yes.

10,402. In the case of these European countries the question was how to get gold backing for their currency systems?—In some cases, not in all.

10,403. In the case of the majority of the countries which really gave anxious thought for their finance?—The anxiety of those who were concerned in the Genoa Conference was undoubtedly to try and restore confidence in and stability to the currencies of the disordered countries of Europe.

10,404. For which countries it was a question of how to get the gold necessary for the backing of their currencies?—It was not always a question of how to get gold; it was a case of how to get them to use it.

10,405. Wasn't it a question also of giving them credit in order to start their currency programme?—It went a stage further back and pointed out to them that you could do nothing as regards the getting back to anything like stability until you stabilised the budget.

10,406. But after the budget part was over?—It was not in all cases a matter of a real shortage of gold. It was an unwillingness to face the fact in a great many cases that the currency had essentially broken away from its pre-war parity, and it could not be usefully thought of in terms of its pre-war parity.

10,407. These countries, Sir Basil, didn't have gold imported on private account?—Not to any extent comparable to that which takes place in India.

10,408. In India there is a free import of gold and the import of gold last year was much more than what Government imported?—Oh, yes; the Government did not import anything last year.

10,409. I mean much bigger than Government have ever imported in one year?—Oh certainly.

10,410. Therefore, the remedy that has to be devised in the case of India should be one which is different from that required by some of the States of Central Europe?—I don't think that the currency policy alone can finally solve the question of the Indian habit of importing gold for private purposes.

10,411. No. Not the currency policy alone but a correct currency policy in keeping with what Indians can understand and appreciate would help that solution very materially?—I hope so, certainly.

10,412. I take it that you also think so and agree with it?—That is the basis of my recommendation of the gold standard.

10,413. Then in that case, Sir Basil, bearing in mind that the bulk of the evidence before the Commission has been for a gold standard and a gold currency and that not a single witness, as far as I remember (I speak subject to correction by any other member of the Commission) not a single witness has indicated inconvertible paper, do you think that a policy which indicated inconvertible paper (you can later on put it in any shape you like) would be the correct safe policy in the direction of the goal of the Genoa conference?—I should hesitate to count heads when I was weighing evidence. If I got really good evidence from two people in favour of inconvertible paper, I might regard it as more important than evidence against it from 200 people.

10,414. Yes, if it was of such outstanding merit and if you saw such merit in it. But where it was a question of getting popular approval of it and getting something which would be acceptable to the country, I don't think we can get out of counting heads?—Except that I hope that the report of Commission will be a real education to the people of the country, and it is after all the duty of those who understand the subject to educate the others to appreciate what is really good for them rather than to say that because you ask for something though we do not think it is best for you we are going to give it to you.

10,415. If there were not any material defects in what was accepted by the country and looked forward to by them, could you turn it down lightly?—I think we are getting into rather a hypothetical region What I do say is that I do think the demand for gold in circulation in India is based on some misunderstanding of currency and I would like to do my best to make people realise the benefits of something other than actual gold in actual circulation.

10,416. And I take it that from what you have told us before now it would be a fair inference that you are for steady measures which would lead in that direction?—Certainly.

10,417. (*Sir Purshotamdas Thakurdas.*) May I ask questions, Sir, regarding the ratio?

10,418. (*Chairman.*) I think it would be convenient now to cover all outstanding questions.

10,419. (*Sir Purshotamdas Thakurdas.*) Then I will ask after any other member who has questions to ask on the question I have finished.

10,420. (*Chairman.*) I think, Sir Purshotamdas, you had better proceed, and then we will have a general sweep up.

10,421. (*Sir Purshotamdas Thakurdas.*) I propose now, Sir Basil, to ask about the question of ratio. In your evidence at Delhi you said that in October, 1924, the Government apprehended that in the absence of definite action by them the rupee may quickly go up to 1s. 7d. or 1s. 8d. sterling, which would have meant 1s. 5d. or 1s. 6d. gold at that stage, and that Government decided that some action would have to be taken to prevent the appreciation of the rupee for 1s 6d. sterling which was then 1s. 4d. gold. Could you give me the reasons that induced the Government to change their policy and eventually allow the rupee to reach 1s. 6d. gold which was exactly what they appear to have wished to prevent at the earlier stage?—1s. 6d. gold?

10,422. Yes?—The Government did not change their policy. The Government, as was explained in the previous evidence, intervened at the moment when exchange was at 1s. 6d. sterling with the intention of preventing it from rising above 1s. 6d. sterling. The moment of their intervention was actually the moment when exchange was for the first time for some time past at 1s. 4d. gold. The reason for their intervention at that moment was that it was the beginning of the busy season and they had to intervene and take some action and for the time being fix on some rate which they would regard as the maximum they thought desirable for the time being. The rate they fixed on was 1s. 6d. sterling. The fact that 1s. 6d. sterling became 1s. 6d. gold during the next four or five months was a matter which arose out of the appreciation of sterling in terms of the dollar, as the moment approached when sterling and gold became on a par again. The Government of India did not change their policy in any way. They stuck steadily to their figure of 1s. 6d. sterling.

10,423. And they would have stuck to the figure of 1s. 6d. sterling whether the sterling reached gold at all or not?—For the time being they choose 1s. 6d. sterling as the figure at which to keep exchange steady, not with reference to its value in terms of gold but with reference to the steadiness of the rupee—sterling exchange.

10,424. I see. Considering the course of exchange since 1898 when it was stable at about 1s. 4d. for 20 years, rising and unstable for 3 years thereafter, 1918-20, varying from 1s. 4d. to 2s. 10d. and unstable for 2 years, 1920-22, rather steady at 1s. 4d. for one year, 1923, and again rising up to 1s. 6d. for one one year, 1924, and recently steady at the latter figure, do you think in these circumstances, all adjustments at the level of 1s. 6d. could possibily have been made?—I think, I said in the previous evidence that in my view the majority of the adjustments arising out of the various changes that have taken place in the value of the rupee over the last ten years were in process of being completed at the rate of 1s. 6d.; that there were some still to go and others would probably take a little longer, but broadly speaking the adjustments were approaching completion. I don't think that one can talk about it as adjustments as from 1s. 4d. to 1s. 6d. It is adjustments to a rate that for the first time for 8 years has been steady for over a year.

10,425. Yes. Would you name the principal items of adjustments which are not yet complete?—I think that cotton is one of the instances in point. The price of both raw cotton and cotton goods. World conditions have affected the position very considerably and cotton has been rather out of equilibrium with other prices. I have not in my mind at the moment any general list of cases in which adjustment has been completed or is approaching completion, and of course it is a matter where it is difficult to be precise.

10,426. Of course at Delhi we agreed that wages had not been adjusted, neither industrial nor agricultural?—I said that I didn't think there had been any fall in wages as the result of the recent rise in the rupee but that there was a general tendency for money wages I thought to rise in India over a long period and for real wages to rise too and that I didn't expect a large fall in money wages as a result of the fixation of the rupee at 1s. 6d.; that its effect would be, if anything, rather to postpone or prevent the rise in money wages which would otherwise have taken place.

10,427. The representatives of the Bombay millowners giving evidence before the Commission definitely mentioned it as their conviction that they do not expect to be able to put down wages without great disturbance to the relations between labour and capital in Bombay. Asked whether they do not apprehend having to raise wages if 1s. 4d. was stabilised, Sir Victor Sassoon definitely said that this association apprehended nothing of the sort as their experience during the last 25 years has shown that labourers expect an increase in wages only when the mills are thriving. Do you share this opinion of the mill-owners or will you give us the reasons why you differ from them?—The mill-owners said, as I understand it—I have not seen their evidence—that they see no possibility of putting wages down much as they perhaps would like to do it, without a strike. Therefore, they want the assistance of this Commission in putting them down by putting the rupee to 1s. 4d. instead of 1s. 6d. That is how I would read that statement.

10,428. That may be one way of putting it. But I don't think that is the way in which it was either meant to be taken or understood?—That is its effect, I submit.

10,429. That may be, and I am quite prepared that it should go on record as your construction. I am only concerned with the question to this extent. You said that the tendency of wages in India is to rise and 1s. 6d. has prevented the rise. An important section, a very large employer of labour in Bombay has definitely said that they don't apprehend any rise except when the industry is prosperous. And that if 1s. 6d. was stabilised they fear that they will not be able to continue to pay on the same scale as at present, and a long and perhaps very distressing struggle may have to be started between capital and labour. That is the extent to which I am concerned with them?—I quite see their difficulty. Their difficulty is that they feel that with the rupee at the 1s. 6d. level, the money wage which they are at present paying is actually higher than they can afford. And they would like to get out of the difficulty by a reduction in the rate of exchange, quite naturally.

10,430. Not for that purpose. However, we won't discuss that. Therefore, you share their apprehensions in that if 1s. 6d. continues, their apprehensions regarding a long struggle between capital and labour may come to be realised?—I don't know that I necessarily share their apprehensions but I recognise that they have had some difficulties.

10,431. Do you agree with them when they say that if exchange was stabilized at 1s. 4d., they would not have to pay an increase?—I must say that if I were a worker in a Bombay mill, when exchange was down at 1s. 4d. I should ask for an increase.

10,432. They say that labour would not strike for higher wages?—It does not definitely mean a reduction in the money wages of the labourer. Therefore I do not say that they would strike for higher wages because it will be concealed in the form of a fall in exchange. But it would certainly be a reduction in the real wage of the labourer; whether it would be justified or not, I think I am not in a position to say.

10,433. I am sure that there has been no reduction in railway freight since the appreciation in the rupee?—Yes, I think there has been some small reduction.

10,434. A general reduction in railway freight rates?—No general reduction as yet; there have been some small reductions and I hope that considerable, rather bigger reductions both in railway freights and railway fares, are coming fairly shortly. That is a matter which will perhaps be known by the time the Commission has reported,—as to whether there has been a further reduction,—but I think it is quite definite that as a result of the improved position

with which the improved exchange has something to do, the railways are earning considerable sums for their reserves and are hoping to be able to use those reserves for a reduction of fares and rates.

10,435. Of course that is a matter of State secret until the Finance Department notify it and I do not propose to ask you on that. There is one general question. Until there is a corresponding reduction in railway freight rates and carriage or for export of goods to the coast, you would recognise it as a maladjustment?—I think that the present rates of railway freights and fares are historically due partly to the difficulties of the Government of India in budget matters during and after the war and partly undoubtedly to the rise in prices and general financial difficulties, and that as things grow easier, a reduction is due. That is one of the reasons and the other reason is the improved position of the exchange. I do not know that it is quite true to say that there is a maladjustment at present between railway freights and other prices, because I think if you compare the pre-war position with to-day, the railway freights have not gone up by more than on the average 30 per cent. whereas the general cost of living and general wholesale prices have gone up by almost double that amount.

10,436. Railway freights have not gone up by more than 30 per cent.?—I think I am right in saying that; I remember figures being given in a debate in the Assembly about a year or two years ago.

10,437. I remember those figures roughly but I am not questioning you about them. What I want to ask is whether in cases where the general level of prices for a raw material which is exportable is advanced by say, 70 per cent. over the pre-war level of prices, if the other charges payable on that raw material after it leaves the field and before it is put on a ship, has advanced 30 or 40 per cent. in such case does the appreciation of the rupee not mean a reduction to the grower to the extent of maladjustment in these intermediate charges between the farm and the ship?—Appreciation from what?

10,438. From its pre-war figure?—One cannot expect the prices of all the various commodities to settle down in exactly the same relation to each other as they were before the war. I think as a general statement I could accept what you say, that where charges have gone up more than in proportion to other prices such as if railway fares which you mention have gone up more than in proportion to the other costs, there is some further adjustment which is likely to take place, or is desirable.

10,439. Can you tell us approximately the period when the balance of adjustments is likely to take or should take to make the maleffects of the appreciation disappear?—I think the vast majority of the adjustments take place within a year or 18 months and there are some which necessarily—the customary prices and things of that sort—take very much longer but I think the vast majority take place within a year or 18 months.

10,440. One or two witnesses that I have in mind I think put down the period at between 7 to 10 years?—There may be individual cases where an adjustment may not take place for a life time but I think 99 per cent. of the adjustments take place very much quicker, within a couple of years.

10,441. Between say 18 months and 5 years?—I say within a couple of years.

10,442. Is it the intention of Government to make any reductions in the pay of their subordinate and menial staff and of the superior services in view of the appreciation of the rupee?—Again the appreciation of the rupee from 1s. 4d. before the war to 1s. 6d. now, meanwhile prices, the level of prices having altered all along the line. I think it is generally true that if you take 1914 and the cost of living or wholesale prices or retail prices then and compare them with what they are to-day and then you take the wages and salaries of either the subordinate services or the higher services, the salaries have gone up less than in proportion to the rise in prices. That is certainly true of the higher services; it is not perhaps true in all cases of the subordinate services; but I believe it is on the average true that even in the case of the subordinate services the increase in wages has not been entirely in proportion to the increase in prices; that is, the subordinate services along with the rest of the population are paying some share of the cost of the war.

10,443. In 1922, when the rupee was under 1s. 4d., it was generally recognised that the increases given in the pay of various Government servants were about commensurate with the rise in the cost of living?—Was that agreed generally? It certainly was not true of the higher-paid services.

10,444. I am only asking you whether it was not the general feeling that no more increases were either called for or should be given?—Certainly there had been a tendency I think in view of the increase in the cost of living and so on to think that one after another the increases in the salaries to the subordinate services should not be more than the State ought properly to bear in the difficulties in which it was, but I do not think it was established that to any general extent there had been an increase in the pay of the subordinate services more than in proportion to the increase in the cost of living.

10,445. You have heard it that the range of pay in private service, of private individuals, etc., shows an inclination towards some curtailment?—I believe that is so at present.

10,446. Need not Government follow it up?—I think Government are in the position of not having followed the rises quite to the extent of the private employers, and therefore one is not likely to follow the fall quite so readily. But I may mention, speaking for myself, that the general effect of the increase in the rupee up to 1s. 6d. recently has been to enable me in many cases as Finance Member to rufuse increases that I might have had difficulty in refusing otherwise.

10,447. On the score of the appreciation of the rupee?—Yes. It works negatively much more than positively; it is much more difficult to work it positively.

10,448. With reference to paragraph 4 of Mr. McWatters' memorandum, there the deficit in the Central Budget owing to a ratio of 1s. 4d. being adopted is put down at 3·16 crores excluding railways. Against this it is pointed out that there would be a higher revenue from increased customs on articles which are liable to an *ad valorem* duty. Mr. McWatters gives the figure for the higher return on *ad valorem* articles at 2·62 crores on the following two assumptions, (1) that the figure of imports is not diminished, (2) that the price of imported goods is raised by the full amount of 12½ per cent. Allowing a reduction of 62 lakhs for variations due to the two assumptions of Mr. McWatters, there is a net loss of 1·16 crores in the general Budget of the Government of India, excluding railways. Do you think that the Central Government are likely to make up this 1·16 crores by increased revenue under the head of income-tax as local industrial concerns and the general commercial community as a whole claim to be better off with a lower exchange than a higher exchange?—I am afraid I do not follow those figures. I have not seen Mr. McWatters' memorandum.

10,449. You see, 3·16 : 2·62 is what he gave by a subsequent memorandum. You would like to see that memorandum? He put in a memorandum which I asked for in Delhi, but unfortunately it is not with me?—I do not think I have seen it. The assumption is?

10,450. The volume of imports is not diminished, and secondly the prices of imported goods rise by the full amount of 12½ per cent. in rupees?—I wonder if you could kindly repeat the question.

10,451. The first part is only a summary of the memorandum. With reference to the paragraph in Mr. McWatters' memorandum, the deficit in the Central Bank due to the ratio of 1s. 4d. would be 3·16 crores excepting railways, and, of course, not

counting capital expenditure. Against this there would he a higher revenue from increased customs on articles which are liable to *ad valorem* duty. Mr. McWatters gives figures for the latter at 2·62 crores on the following two assumptions, (1) that the volume of imports is not diminished and, (2) that the prices of imported goods rise by the full amount of 12 per cent. Allowing a deduction of 62 lakhs for variations due to the two assumptions of Mr. McWatters, there is a net loss of 1·16 crores. Do you think that the Central Government are likely to make up for this 1·16 crores hy increased revenue under the head of Income Tax as local industries and the commercial community claim to he better off with a lower exchange than with a higher exchange?—I do not think that there would he an immediate increase either in the customs duty or in the yield of any other tax to the extent proposed. The increase in the customs duty would prohably fairly he seen over a period of two or three years. But the increase in Income Tax seems to me to be very problematical. I said last time that I thought that ultimately, after a period of some years, it made no difference to the Government what rate of exchange there was. But the temporary effect of a lowering of the rate must necessarily be an immediate increase in taxation. I do not think that you would get the full two crores in the two years that you are speaking of, and so far as other taxes are concerned, it will he more like three years before you get the additional yield from existing taxes as a result of the lowering of exchange.

10,452. May we take the two separately just to understand the position a little more clearly? Regarding the increase in the return from the customs, is it not indeed a mere matter of calculation? After all the rupee prices would advance to the extent of $12\frac{1}{2}$ per cent. as hetween 1s. 6d. and 1s. 4d?—Yes; but of course, there is a considerable lag. Most of the valuations are annual. Some are longer than annual, so that it would not he until you had had a year at the higher prices for imports that you begin to get the henefit.

10,453. I fully agree. I am not thinking at all of the higher prices. I am only thinking of the conversion of the sterling into rupee?—Your customs duty is paid in rupees on a tariff valuation.

10,454. And the invoice price is converted from the sterling into the rupee, either on 1s. 6d. basis or on 1s. 4d. basis?—In a great many cases the valuation is annual.

10,455. But is your annual valuation in rupees or is it in sterling convertible at the current rate?—In rupees.

10,456. Even for *ad valorem* articles?—Yes; so that you have got to consider a longer period.

10,457. One year at the most?—Yes; and certainly not less than one year on the average.

10,458. And that year need not necessarily mean delay because when you adopt 1s. 4d. in your budget that would be about the time when you fix prices for the customs revenue?—The valuation is fixed on an average of prices over the preceding period. It is an automatic result of an average of prices for the preceding year.

10,459. And if the exchange went up to 1s. 8d., don't you think you would have to give the commercial community the benefit of the higher exchange and take lesser rupees?—In such a case you would change your system of valuation rather arhitrarily.

10,460. But surely you had to thus change before now. Of course, the war period is rather had in that sense?—We had the position of course. It is very frequent. Any of those who have been dealing in imported articles will know that. The traiff valuation, the change on the first of January in the tariff valuation, has made a very hig difference in regard to a good many of these articles owing to previous figures. For instance customs on cotton goods. There was a big fall in the valuation of cotton goods introduced rather exceptionally, I think, in the middle of the year in view of the special difficulties of the cotton trade.

10,461. You had to put down?—We did put it down rather exceptionally early.

10,462. There therefore is a precedent which would not prevent you from putting it up now if justified. It will perhaps depend on the extent to which the Finance Department assert themselves?—I doubt if we could force anything of that sort.

10,463. One of the reasons embarrassing the Government of India in a scheme for gold standard and gold currency is the quantity of gold required hy the Government for the new policy and the cost of the same. With exchange stabilised at 1s. 4d. gold to the rupee you require less gold for every rupee that may be offered for exchange in gold and the amount of gold actually required will be appreciahly less than the amount of gold which you estimate on the 1s. 6d. basis. What importance do you attach to this consideration of the fixing of the ratio of exchange between the gold and the silver rupee?—It is a very attractive method of reducing the cost of the gold standard which has not escaped our attention. But it seemed to us that you could hardly deliberately set ahout to reduce the value of all your silver rupees now in the hands of the puhlic in order that you might possibly redeem them at a less price. It did not seem to he a consideration that the Government could very seriously put forward, either put forward as a reason for doing something or give weight to as a reason for doing something, that they would he ahle hy putting exchange at 1s. 4d. rather than at 1s. 6d. to pay less for the rupees which they want to redeem.

10,464. Consideration for those who hold rupees in hoards? Not fair to them?—It is hardly fair deliberately in order to be able to redeem those rupees at a lesser rate. I recognise it is a very important contrihution.

10,465. What about those, Sir Basil, who hold their hoards and their savings not in precious metals as hoards hut as silver ornaments?—The precious metal of silver ornaments is not a promise of the Government to pay. It is not a bit of silver stamped by Government stamp. It is an ordinary commodity.

10,466. Even though you may recognise, as I am sure you will, that the silver ornaments represent the hoards, the savings, of the poorest classes in India?—In some cases of course: that is one of the difficulties.

10,467. In the majority of cases. Who else wears these ornaments?—The richer classes have it in the form of silver utensils. I was not confining the word ornament simply to personal ornaments. But I accept the point. One of the difficulties of course of the proposal for a gold standard is that it will reduce the value in the hands of the large hulk of the population of the silver which they hold.

10,468. As against the consideration that the Government wish to show towards the people who hold rupees in hoards and to those who hold rupees in circulation it may not matter at all, don't you think that the other consideration ought to weigh equally if no more?—I think I should say not so much, because it is not a Government promise to pay. But it is an important consideration. We had proposed, you rememher, to protect the holders of silver in this country to some extent by the imposition of a four anna per oz. import duty, which will be a protection to the holder of the silver ornaments to that extent.

10,469. Yes; hut that would be a round-ahout way of giving protection and if we merely agree that some protection, or every possible protection which may he given should be given, would not the lower rate of exchange he the most direct protection that you could give?—I do not think the lower rate of exchange in any way helps the holder of silver ornaments.

10,470. Is silver not worth less in rupees at the higher rate of 1s. 6d?—It will have very little effect in reducing the amount of silver that you will have to liquidate.

10,471. Of course not; but it would make a difference in the price that the holder of silver ornaments will get?—It makes a difference from the point of view of Government between the currency value of the rupee and its value as bullion. But it does not add anything to the bullion value of the silver in the ornaments.

10,472. Except that the market price of it is higher in rupees?—I do not think it is any the higher.

10,473. To-day the price of silver here is 71 rupees. If exchange was 1s. 4d. you think that the price will be 71?—But the commodity price would not be any higher.

10,474. How do you mean the commodity price?—Rs. 71 for 100 tolas at present. If you had the exchange at 1s. 4d. . . . .

10,475. It would go up by Rs. 9?—Only Rs. 9? Yes.

10,476. Then silver could not be imported into India at less than Rs. 80 per 100 tolas?—It would, certainly, I agree, be worth more in terms of rupees. But those rupees will be worth less in terms of commodities. But you have done nothing to help the holder of the silver ornaments by allowing him to get rather more rupees at a rather less value. He gains nothing by getting more rupees if they are worth rather less.

10,477. The question then is at what stage is the rupee worth the same, and you come back to the same point?—Yes.

10,478. A witness in his written statement before the Commission has the following. I may say, Mr. Chairman, that this is by Professor Junnarkar of the Dacca University, whose written statement I have here. He says "The rise of the rupee in terms of goods is artificial in so far as it has resulted from an artificial limitation of currency, and temporary in so far as it does not appear to have affected services. It is urgent in the interests of the country that this 'deflation' must cease, and a provision be made for an automatic increase in currency in accordance with the needs of commerce and industry." Do you agree that the rise in the rupee has resulted from an artificial limitation of currency?—I think that the value of any currency depends ultimately on the supply. It is supply in relation to demand.

10,479. I am afraid I have not been able to follow you?—The rise in the value of the rupee is due to its being less abundant in relation to the demand than it would have been if there had been more of it. It is exactly the same as has happened in England for example in getting back to the gold standard. You may say that the return of sterling to the gold standard is due to an artificial limitation of the supply of the former.

10,480. Now let us look at it from this point of view which I think would be easiest understood. If deflation was really required by the country or if the country really needed deflation the deflation would be made by the direct method available to you, namely, by offering reverse councils. You stopped that and you deflated without any method it is said?—I do not agree that the offer of reverse councils is the only possible method of deflation.

10,481. It is the only one by which you can accurately gauge whether deflation is needed by the country or not?—I do not agree at all. You cannot accurately gauge whether deflation is needed by the country by any method whatever.

10,482. Then does it remain at the sweet will of the person or persons managing the currency to decide whether deflation is necessary (or called for) or not?—It will always remain at the will of some one or somebody.

10,483. Then the automatic part of it is unnecessary?—It cannot be absolutely automatic. As I say it depends on the discount policy of the Central Bank. With the most automatic system, the discount policy of the Central Bank is the key to the successful working of the system, however automatic.

10,484. Well where you have no Central Bank and no discount policy as in India as she was between 1921 and 1924, don't you think that the only correct method of gauging whether the country either could stand or needed deflation is to offer reverse councils?—No, I don't.

10,485. And you therefore then would not agree, I take it, that the limitation of currency was an artificial method?—No, I would not agree with it in that form.

10,486. Could you tell us why, then, the Government of India did not offer reverse councils in order to test whether the commercial community really needed deflation?—Because I do not think it would have tested it.

10,487. But I thought that was the direction in which you proposed to perfect your gold exchange standard scheme?—You could not offer reverse councils unless you had some fixed figure. You had not got any fixed figure of exchange except two shillings to the rupee. If the two shillings ratio which stood then was the ratio for which you were working, there is not the least doubt that there was a very large excess of currency in the country over what was necessary in order to secure a ratio of two shillings to the rupee, and a very large amount of contraction of currency would have been necessary in order to bring about the two-shilling ratio. But if you assumed, as I did, and at any rate as the Government of India have done for the last three years, that the two shilling ratio was not the one at which they were aiming, then, unless you had some other ratio already fixed at which you were aiming, it was impossible to offer reverse councils or have any definite policy of deflation. You cannot have an automatic policy until you have got your rate of exchange fixed.

10,488. Exactly; I follow your point, and I would then only ask whether if there was any effective ratio on the statute you would consider it imperative not to deflate without offering reverse councils?—I do not think that actually offering reverse councils would be the thing, but something having an equivalent effect, yes.

10,489. But I thought when you suggest putting it on the statute under your perfected system of the gold exchange standard, that that would be the most natural method of deflation?—What I suggest is not offering reverse councils, which is really offering drafts on the India Office, but what I do suggest is that the Imperial Bank should be required to sell foreign exchange at a minimum rate by themselves.

10,490. Something corresponding to reverse councils in our present scheme, imperfect as it is?—Something corresponding to that.

10,491. Yes, that is why I mentioned reverse councils, because you have nothing corresponding to it now except in the reverse councils?—An equivalent method is the transfer of securities from the paper currency reserve in London to the Secretary of State's balances and a corresponding transfer here.

10,492. And cancellation of notes here?—Yes.

10,493. Do you think that our resources, Sir Basil, are ample enough to prevent any depreciation of exchange from 1s. 6d. in case of—I will name the five heads that I have:—

(i) adverse balance of trade;
(ii) scarcity or famine in India;
(iii) disturbance of credit abroad;
(iv) slump in gold prices in the world at large and a relative fall in world prices as compared to Indian prices; and
(v) unrest in India causing withdrawal of capital.

Should any two of the causes enumerated above combine in any one year, do you not apprehend a severe demand on the resources of Government which would tend towards the downward course of the exchange?—There is not the least difficulty in maintaining exchange at whatever rate you might fix,

provided it is reasonable, subject to your discount policy being right. It may mean a very severe amount of stringency in the money market at certain stages, but provided you face that I do not think there is any great difficulty in maintaining your rate, whatever you may choose to make it. I think that it is ultimately simply a question of your policy in regard to making rupees scarce or otherwise. It can be done by the credit and discount policy of the Central Bank.

10,494. I understood from your evidence at Delhi, Sir Basil, that no justification is necessary for retaining the 1s. 6d. rate beyond the fact that Government have succeeded in maintaining it for a year, and that justification, if any, will have to be for altering the rate?—Yes.

10,495. The imperfect gold exchange standard under which we have been working till now, do you not think that it discounts materially the *de facto* rate because the methods by which the *de facto* rate was reached were methods which imply complete mismanagement?—I do not see the connection. My reason for thinking that the 1s. 6d. rate does not require to justify itself against any attacker is that it is the rate which has been in force for nearly a year and a half. The fact that that rate was reached as a result of particular action does not seem to me to affect the issue at all.

10,496. It is contended that that rate was not reached by either methods or immediate circumstances which were natural, as we admit that the gold exchange standard till now prevalent is imperfect?—I do not think that it was reached by methods that were particularly unnatural. As I say, unless you had a fixed rate you could not have reached it by any method.

10,497. Therefore, the unnatural part came in with the ineffective rate on the statute for the last four years?—The unnatural part came in with the rise of silver above its bullion value. From that moment onwards the ratio which was natural was divorced from the pre-war rate and you did not have a new one till the Babington-Smith report came out. That new one was not successful, so you really had the same difficulty of the divorce of the rupee from any fixed rate continuing till now.

10,498. The circumstances lent themselves to the unnatural handling of it, irrespective of blame to anybody?—The circumstances themselves divorce the rupee from its moorings and it has never been moored since, and as long as the rupee remains divorced from its moorings it cannot be at any natural distance from those moorings because they do not exist.

10,499. Would not the rupee have stayed at its proper ratio if the authorities had wished it so?—When the authorities had decided what the proper figure was.

10,500. Therefore, the unnatural part was that the authorities did not decide what the proper figure was?—The unnatural part was that there was and there is no proper figure until this Commission has reported.

10,501. (*Sir Purshotamdas Thakurdas.*) I understand that the Bank of England is responsible to buy and sell gold, without limit of amount, within the gold points?

10,502. (*Chairman.*) The minimum amount for the sale of gold?—Subject to a minimum.

10,503. (*Chairman.*) There is no maximum.

10,504. (*Sir Purshotamdas Thakurdas.*) I was thinking more of the maximum. Now if the Imperial Bank is to undertake a similar obligation, to sell either gold or sterling without limit within the gold points, do you think the Imperial Bank have the resources, which by experience have been found to be wanting in the case of the Government of India before now, without sterling borrowings?—I believe their resources are ample enough for them to undertake the obligation at the present time. So long as the Government of India have a very large programme of capital expenditure on new development involving considerable capital expenditure outside India, the question of sterling borrowings or external borrowings by the Government of India will arise from time to time inevitably, but I do not think that the resources at present available in the reserves are by any means insufficient to enable the obligation in question to be undertaken at once.

10,505. You do not think that it might compel the Imperial Bank to borrow in London in order to carry out its obligations?—I do not think so. They might find it convenient to do so from time to time, rather than actually sell some of their sterling assets to borrow on them.

10,506. And if they had to borrow, if they were compelled to borrow under certain circumstances, do you think they could borrow as cheaply as the Government of India?—Probably, yes, on security. I do not contemplate their having to borrow otherwise.

10,507. The Government of India can borrow without security?—Yes, at least without specific security.

10,508. The Imperial Bank will not be able to borrow ordinarily without security?—I do not suppose any bank can.

10,509. To that extent the Government of India's credit is better?—The Government of India has a different kind of credit; but I do not contemplate any circumstances arising in which the Imperial Bank would require to borrow without security. It is almost inconceivable.

10,510. (*Sir Reginald Mant.*) Sir Basil, I have only one question to ask you in connection with what you have said about paragraph 13 of Mr. Denning's memorandum, namely, the method by which gold will be forced into the country; you said, I think, that if the exchange banks were forced to import gold they would probably sell it to the bullion dealers in India. Now, we have been told by Marwaris and others connected with the bullion trade that India had recently been importing as much or even more gold than she could consume?—Yes.

10,511. Now, if the exchange banks were to sell their gold to the bullion dealers the only result would be, would it not, that the imports on private account would be correspondingly reduced?—The assumption is that there is an extra demand for gold for conversion of these hoards of silver rupees into gold, a demand which is not at present in evidence, though it must be assumed to be latent. There will be this extra demand in our assumption which must be met by an extra supply. If the extra demand does not arise the extra supply will no doubt not be imported.

10,512. The demand would only become evident or cease to become latent if you took some steps to demonetise the rupee?—The assumption, I think, is that you will have announced as your policy a policy that you will ultimately take away the unlimited legal tender privilege from the rupee, which is rather a different thing from demonetisation, and that that announcement will make the holders of rupees more inclined to exchange them for gold than they have been hitherto.

10,513. So, the net imports of gold into the country would not increase unless rupees came out of hoards?—Unless these hoards exist and unless the holders of them set to work to convert them into gold, then there will be no extra demand for gold.

10,514. And then your system would not bring in any more gold into the country?—It would not bring in more gold into the country on private account, but it would have the result of converting your sterling securities in the currency reserve in England into gold held in the currency reserves in India.

10,515. Then the exchange banks would under that assumption have to bring their gold to the treasury here?—Yes; they would have to take their gold to the currency office.

10,516. (*Sir Maneckji Dadabhoy.*) Assuming that we go back to 1s. 4d. ratio, you have pointed out that there would be a deficit in the Budget. We

have been told by some witnesses that the Government are financial bookies and that they have no right whatever to make profits on exchange. May I know your views on that aspect of the question?—This is a compliment that I do not remember being applied to me before; I am not sure that I am ready at the moment to answer it. In normal circumstances it is most desirable that exchange should be stable, and if exchange is stable any profits on the exchange that may be made will be naturally quite small and incidental to Government's operations; but I think that in so far as Government have to undertake exchange operations, such as every Government has to undertake, when it is paying money abroad, it is entirely legitimate to try and do it at the best possible rate.

10,517. Then I understand you to say that it is a perfectly legitimate source of revenue to make money by exchange?—It certainly is entirely illegitimate to manipulate exchange in order to make profits for the Government; but it is entirely legitimate to try and do your exchange operations, whatever they may be, at the best rate possible for the taxpayer.

10,518. We have been also told that this deficit in the Government revenue can be made up by increase in customs duties. You have answered partly in reply to Sir Purshotamdas, but I would like you to make the position clear. What will be the position in the internal economy of such increase in the customs duties?—The suggestion is not, I think, that there should be an increase in the rates of custom duties, but that the result of lowering the exchange value of the rupee will be to increase the rupee prices of imported articles, and that since those imported articles are taxed for customs purposes *ad valorem*, an *ad valorem* tax will bring in more money. As soon as the adjustments following on a change in the exchange rate have been completed, I do not think the economic position of the country is in any way affected. Temporarily the effect of a falling exchange might be a considerable reduction for the time being in imports.

10,519. We have been also told by some witnesses that as the selection of the ratio lies between 1s. 4d. and 1s. 6d., and as the adjustments have not been fully completed, we ought to take the mean; what is your view on that?—It seems to me nonsense.

10,520. There is no soundness in that argument?—I cannot see any rhyme or reason in it.

10,521. Then I draw attention to paragraph 224 of your evidence where, in reply to this question by the Chairman, "And the consequential question as to the method by which the bank would pay for the privilege of note issue," you said, "that is, of course, to some extent, dependent on the particular system adopted, though it is to some extent independent. But it does raise the question of the reconstitution of the bank, because one possible method would undoubtedly be to make Government in some form or other a shareholder in the bank." Will you please indicate if you have any suggestions to make in which form Government should be made a shareholder?—I do not think I can take my evidence on that point further than it was taken last time, until there is some concrete proposal before the Commission.

10,522. You have no concrete proposal to offer on the subject?—Not in a definite form.

10,523. Because it is a very difficult question to make Government a partner in the bank at this stage and a shareholder in the profits without in a way depriving the shareholders of their legitimate share of the profits?—I believe that all interests concerned can be adjusted with reasonable consideration being given to the interests of all, by some arrangement which would no doubt stereotype the rate of dividend received by the shareholders at something about the present figure and give the Government a share in profits up to a certain point subject to the building up of an adequate reserve. There are many precedents in the statutes and the arrangements between Governments and the central banks in various countries, and as soon as a decision has been reached as to the major question, I believe that the application of those parallels to the Indian case will be found, I will not say at all easy, but quite capable of solution.

10,524. (*Sir Alexander Murray.*) Sir Basil, we have been told in connection with this increase of exchange to 1s. 6d. that all the adjustments have not been completed, and in particular wages have been referred to as an item still requiring adjustment. Now, I take it that wages are adjusted in accordance with the cost of living, speaking generally, and increases of wages are given to keep pace with the cost of living. That is the fact presumably that industry and Government and everybody else has in view when increases of wages are given?—Yes; increase of wages, in a period when prices are changing rapidly, is influenced mainly by the question of the cost of living. In more normal circumstances other factors than merely cost of living come in; because, if cost of living is the only consideration, that really means a stereotyped standard of comfort of the wage earner for ever at one particular level.

10,525. Quite true; taking 100 as the cost of living index figure in 1914 and to-day's cost of living figure at 153 (the latest that we have here), that is an increase of 53 per cent.; and you would allow also for an increase in comfort and other things some margin. What allowance would you make for that?—I should not be prepared to give a figure at present.

10,526. We have had it in evidence that on this side of India the increase in wages in the jute mills was only 50 per cent.; in the coal mines it has been said that it was less than 50 per cent. Now in view of the fact that the cost of living index number is 153 and that the wages increase on this side of India is only about 50 per cent., would you say that the adjustment is more or less complete?—It looks in that case as if the wage earner had got the worst of the bargain and that he should have got higher wages.

10,527. How much more?—It depends entirely, I suppose, on the individual case, on the question whether his efficiency has been improved or gone back, and to what extent it is fair that the wage earner should bear in the form of reduction in the standard of comfort some part of the extra charges due to the war.

10,528. Now, turning to the Bombay side, taking the pre-war index figure at 100, we have been told that to-day's level is 231; that is to say, there has been an increase in wages of 131 per cent?—What is the increase in the cost of living?

10,529. From 100 to 153?—It looks here as if the wage earner in that case had dealt with less clever employers than on this side of India.

10,530. But taking your own suggestion that there must be an increase in the standard of living apart from the increased cost of living, what will you say, keeping in view the difference between cost of living to-day in Bombay and the increase of wages in Bombay, the cost of living having gone up by 53 and the wages having gone up by 131 per cent.?—If this is really the fact, it seems to me that the probability is that the Bombay millowners are paying an unnecessarily high wage; but I must confess the statistics that I have had do not suggest to me that there has been any appreciable increase in the real wage of the Bombay mill-hand from 1914 to the present day.

10,531. The figure I am giving you is the figure that was given in evidence on behalf of the Millowners' Association in Bombay by Sir Victor Sassoon?—I had figures which ultimately came from the Labour Office which suggested that the increase in the real wage of the Bombay mill-hand at the time, in September 1925, when the strike first broke

out was at most 11 per cent., so that a reduction of 11½ per cent. in wages practically brought him back to the real wage of the pre-war days.

10,532. Could you perhaps find the figures? Because the figures I am quoting are figures from the Labour Office in Bombay and the figures from the Mill Association in Bombay?—I will see if I can get those figures and put them in.

10,533. But assuming that the figures we have got from the Mill Association are correct and that the wages are to-day at 231 as against pre-war 100, and the cost of living is only round about 152, would you suggest that it is a good argument for the people in Bombay to use that, unless exchange is reduced to 1s. 4d., they cannot put pressure on their workers to reduce wages into closer relation with the cost of living?—It still remains true that, if the wages are higher than the industry can stand or ought to stand, the direct method of a reduction of money wage is a preferable method to the indirect method of trying to conceal from the worker that you are trying to reduce his wage by reducing its value.

10,534. But how would you arrive at the amount of wages that an industry can stand?—I think I should probably go to Sir Alexander Murray and ask him.

10,535. Well, Sir, I merely wanted to get your opinion as to whether, in view of what the employers on this side of India have paid in the way of increased wages since 1914, and in view of what has been paid in the mill industry on the Bombay side, whether it is a sound argument for Bombay people to use that the increase of exchange to 1s. 6d. has adversely affected them from the wages point of view?—I think that probably it is true that the recent movements in exchange, coupled with the arrangements they had made with their workers, had tended to make their charges for labour rather higher in relation to the cost of production, rather a larger proportion of the total cost of production then they were before.

10,536. It has also been suggested to us that Government themselves increased the wages of their officers and men and are not now reducing them in keeping with the reduction that might be necessary in view of the increase in exchange. In reply to Sir Purshotamdas, I think you said that they had not given as much of an increase in wages as would have been justified probably by the increase in the cost of living at the time?—Yes.

10,537. Now, I see that the cost of living was, the highest figure we have here is—in 1920, 190, in 1921, 177, in 1922, 165. Now if the cost of living has dropped from these figures to 153 and you adjusted your wages in keeping with the cost of living at the time I have quoted, then there has been an increase in real wages now?—Certainly the recent fall in the cost of living has brought about an increase in real wages as compared with what it was two or three years ago.

10,538. So that even with exchange at its present level, the people to whom you gave increases are relatively better off than they were two or three years ago?—Yes, they are better off than they were two or three years ago, but whether they are relatively better off than they were in 1914 is another question.

10,539. Can you say how much you increased?—I have not got the statistics with me. It varies in various cases, but I am quite sure that none of the increases correspond to what the Bombay mill-owners claim they have given to their mill-hands.

10,540. (*Mr. Preston.*) Sir Basil, might I ask just one question in connection with the suggested import of gold with which we are dealing? When the exchange banks require additional currency for seasonable requirements the method hitherto has been that you have sold what is known as excess councils, that is councils beyond your home requirements?—Yes.

10,541. And we simply tendered you gold funds in London. You credited them to the paper currency reserve and in the ordinary course you invested them. So that the securities in your paper currency reserve on the other side increased according to the amount of extra councils?—The increase has not been so entirely automatic.

10,542. Well, shall we say generally speaking?—But if at any moment the Government of India sell sterling to an extent more than is required for its own balances in London, it has as a matter of practice treated these purchases as being on behalf of the paper currency and issued currency against them in India.

10,543. Yes, that would be a set-off against them. But what I want to make clear is this that really speaking the method that brings gold to India will practically speaking be identical with that which buys excess councils. As we tender gold to the currency office, you give us the equivalent in local funds as you did when we bought excess councils?—Yes.

10,544. (*Chairman.*) Mr. Murray, a Managing Governor of the Imperial Bank, suggested in his evidence that the most satisfactory method of settlement between the Imperial Bank and the Government in reference to the transfer of the note issue would be that a minimum dividend should be guaranteed to the shareholders, and that the Government should take the whole, or the majority, of the balance of profits after an adequate provision for reserves. I rather gather, Sir Basil, that your opinion moves in the same direction?—I would not say the whole of the balance as I think that you ought to have a careful arrangement for some going into reserve. Yes, I agree generally. I stated when I was previously examined that I had at the back of my mind a preference for a method of settlement between the Government and the Bank which took the form of a share in the profits rather than the form of direct payment for particular services. Such study as I have had time to give to the matter since then confirms me in my preference for something in the form of a profit-sharing arrangement.

10,545. (*Chairman.*) I have no further questions to ask. The Commission is very much obliged to you indeed, Sir Basil, for your further assistance, and apologises for any inconvenience which may have been caused to you by coming down to meet us here.

(*The witness withdrew.*)

TWENTY-EIGHTH DAY.

Friday, January 8th, 1926.

PRESENT:

THE RIGHT HON. EDWARD HILTON YOUNG, P.C., D.S.O., D.S.C., M.P. (*Chairman*).

Sir RAJENDRANATH MOOKERJEE, K.C.I.E., K.C.V.O.
Sir NORCOT HASTINGS YEELES WARREN, K.C.I.E.
Sir REGINALD MANT, K.C.I.E., C.S.I.
Sir MANECKJI BYRAMJI DADABHOY, K.C.I.E.
Sir ALEXANDER ROBERTSON MURRAY, C.B.E.
Sir PURSHOTAMDAS THAKURDAS, C.I.E., M.B.E., M.L.A.
Professor JAHANGIR COOVERJEE COYAJEE.
Mr. WILLIAM EDWARD PRESTON.

Mr. G. H. BAXTER, Mr. A. AYANGAR, } (*Secretaries*).

Professor C. J. HAMILTON, called and examined.

10,546. (*Chairman.*) You are a Master of Arts and a Professor in the University of Patna?—Yes.

10,547. What is your Chair in the University?—I am Professor of Economics at Patna.

10,548. How long have you occupied that position?—Since 1919.

10,549. And before that?—Before that I lectured in the Department of Sociology in London and then I lectured at Cambridge, and I was a Professor at Cambridge for two years.

10,550. You have been good enough to furnish us with a brief memorandum,† in which you have put forward the main outlines of your recommendations upon the subject of our reference, which perhaps you will be willing to expand to some extent in the course of our discussion this afternoon?—May I say that this note which I have submitted was written under circumstances of considerable pressure? I had just returned from England, where I had not seen the terms of reference of the Commission, nor had I known that I should be asked to give evidence; so that recently I have not been keeping up-to-date with the statistical aspect of the matter, for example. Secondly, after my return to Patna I had no time whatever to prepare a note, and have therefore written my note in a few hours without any books or works of reference of any sort, so that I feel it is probably extremely imperfect and deals only with one or two points. Would it take up too much time if I submitted a very brief statement that I have since written on one or two points not referred to in this?

10,551. Not at all. Please read it.—(*The Witness read his additional statement.*)*

10,552. In your original memorandum, paragraph 4, you say, "Having regard wholly and solely to the economic advantage of India I believe the balance of advantage is largely on the side of the exchange standard." Is that still your conclusion?—Yes. It is very certainly my conclusion if I confine my judgment entirely to what I may call the pure economic merits of the case. As I have already said I attached considerable importance to the desire on the part of the Indians that they should have a gold currency.

10,553. When listening to your supplementary memorandum, I understood there was a passage to the following effect, that the gold standard should be preferred in deference to Indian sentiment?—I think it is qualified. I said that unless there can be shown to be a very decided balance of advantage in favour of the exchange standard the gold standard and currency should be preferred in deference to Indian sentiment.

† Appendix No. 47.
* Printed as an Appendix to Professor Hamilton's oral evidence.

10,554. (*Sir Maneckji Dadabhoy.*) Before that you have stated that it should be in compliance with the Indian sentiment?

10,555. (*Chairman.*) In paragraph 2 of your memorandum, I was not able to follow exactly what is the final conclusion at which we should arrive from your statement. You say: "Is one to recommend a course of action because it is desirable that the Indian people should determine their own economic policy, or should one be true to the results of economic reasoning," and you say that the latter course is essentially preferable?—That is to say, my opinion I think is this: that supposing the two cases showed a smaller balance of advantage in favour of the exchange standard, while Indian sentiment was very strongly in favour of gold currency, then I would say, sacrifice the relatively small advantage. If on the other hand, I feel that the advantage in favour of the exchange standard was really considerable and that probably in the course of a not very long period Indian opinion would be converted to recognise that fact, then I should maintain that it was the duty of anybody deciding to recommend that policy which was economically preferable to a large degree.

10,556. The considerations perhaps seem rather to involve a balance between economic reasoning and a consideration of sentiment which you deprecate in one passage in your memorandum. Let me ask you, after weighing all the pros and cons, which standard do you believe to be that which should be adopted?—Both from the point of view of Indian desire and the point of view of economics?

10,557. When a decision has to be made all considerations have to be taken into account. Ultimately a decision has to be made?—I should sum up myself by saying that I strongly believe that the exchange standard is preferable to the gold standard.

10,558. In arriving at the conclusion that the exchange standard is preferable, you have given a very clear account of the pros and cons. I understand you lay much stress upon the suspicion felt of an undue element of management in the currency system?—I lay stress on what?

10,559. You lay stress, and you agree that stress should be laid, upon the currency system being as free from management as may be in order to encourage confidence and allay suspicion?—I do certainly hold that. At the same time what I was chiefly thinking of, in my note, was that the suspicion now in the minds of Indians regarding what they call a managed currency is unjustifiable because in my view no currency system, when you include under the head of currency the provision of representative money and all the rest of it, can possibly exist without a large measure of management. I think that

the trend of events in India seems to be in the direction of transferring a good deal of the "managing" function from Government offices to banking institutions, but the management will remain.

10,560. In the first place, the transfer from officials to bankers would, in your opinion, encourage confidence that whatever element of management there was in the system was properly controlled?—I am not at all sure that it would.

10,561. The question is, would it encourage the belief that it would?—I say I am not at all sure that it would. What I think, as far as I can visualise the matter, is that it would probably tend to conceal the element of management and in that way the part of the currency system which was obvious and more or less in some way visualised by the public would appear much simpler. To that extent perhaps it might encourage confidence.

10,562. Do you think that the people of India would have more or less confidence that, in so far as management is necessary, their currency was properly managed if the control was in the hands of a Central Bank rather than in the hands of Government?—I personally don't see any reason why that should give greater confidence or sense of greater confidence. It may be so. I am afraid I see no reason why it should be so.

10,563. In a very interesting passage in your supplementary memorandum you deal with the position as regards hoarding and the opportunity of the people to obtain the gold which they require. I understand that your point there is that, in so far as gold is required by the people of the country, it can be obtained with equal facility and be no dearer under an exchange system than under a system based upon a gold currency?—I was assuming in making that statement that the exchange standard included some administrative provision by which you could in practice get gold currency easily. That I take it is not a necessary part of the gold exchange standard; but assuming that it were so, as it existed before the war for example, that is broadly my opinion.

10,564. Is it in your opinion desirable that an exchange standard should be accompanied by a provision that a gold coin is to be legal tender, and that gold is to be minted for holders of bullion into the legal tender gold coin?—No. I think from the standpoint of pure economic reasoning such a provision is a disadvantage. Obviously it seems to me, the two chief advantages of the exchange standard being, as I have suggested, economy on the one hand and greater security on the other, the greatest economy is achieved when you do away with an expensive currency such as gold to the greatest extent. In so far as you facilitate gold circulating it seems to me to detract obviously from its economy. To that extent the trend of development before the war, on the one hand of developing the exchange standard and on the other of giving the people the currency they require, was a compromise, a sacrifice of the purity of principle.

10,565. You dwell upon the disadvantage that, in so far as gold passes into circulation, it is an expense to the country. What is your opinion about the contention that having gold in circulation under those circumstances also reduces the elasticity of the currency of the country?—I am not sure that I follow the suggestion in your question.

10,566. The suggestion is this, if I may make quite clear what the contention is that has been advanced. Supposing the whole of your currency is in notes, then any provisions for seasonal expansion cover the whole of your currency. Supposing half is in gold, then the provisions cover only half the currency. Therefore the more the gold the less the elasticity. Would that be a serious consideration as regards putting gold into circulation?—Well, I am afraid I do not see the force of the original argument. If you have a currency made up half and half of gold and notes, and the total of your circulating medium is x at any moment, when it has to be $x + n$ at some other moment, whether the currency consists entirely of gold or partly of gold and partly of notes or entirely of notes does not seem to me to affect the quantity of additional currency that may be required at a given time. If you suggest that people are holding their sovereigns, not as currency, but really withdrawn from currency in the form of hoards, then the question is different. But at any rate it merely means this, that your currency with gold in circulation at the moment of departure, so to speak, is not x, it is x minus the amount which is demobilised as currency. Whether in a time of stress it would come out from its hiding place and become currency again is perhaps a debatable question. It probably would; and that, I think, has been advanced as a reason why it should be more elastic, that the gold element would give greater elasticity.

10,567. Can it make any difference to the elasticity of a currency whether a hoard is held in the form of gold, or rupees, or in any other form?—It seems to me that it might do so in so far as people hold resources which on the one hand are immobile and on the other hand are mobile. If they hold gold ornaments or silver ornaments which cannot readily be converted into currency, then when some time of need arises I take it they have to go to the money-lenders and get 50 per cent. of the value of this property, and that 50 per cent. is coin, so to speak. If the other system prevailed they could coin the whole lot of it.

10,568. I understand you arrive at the conclusion that, as regards the desired purpose of encouraging the habit of investment for making a better use of savings than keeping them in the form of a hoard, there is nothing much to choose between the two systems?—I do not think so. I have asked quite a large number of Indian economists with whom I have come in touch for the reasons for the opinion that exists that it would make a greater difference, and so far as I have been able to learn they do not rest upon any very sure foundation. It is always stated that it would be so, but I have never yet been shown any special reasons or any steps by which the result would come about. My own feeling is that the immobilisation of wealth, in other words hoarding, is mainly the result in a conservative country of long tradition and practice and so forth. On the other hand, not only the backward development of banking, but the lack of any desire to use banking facilities and unfamiliarity with banking facilities—I think those are by far the greatest reasons, and I do not think the movement towards the investment of hoards will be greatly accelerated. I admit there is something in its favour, but I cannot see how it will profoundly alter things.

10,569. The case might perhaps be put in this way as briefly as may be, that security, as you tell us, is the underlying need of the saver in India, and to hold gold gives him that security in his belief?—Yes.

10,570. Having gold, before he will part with it he must be convinced that he can get it back again, and get it back not in gold's worth but in gold itself? The only way to persuade him to part with gold is to make him perfectly confident that he can get gold back, and the only way in which that can be done is by having a convertible internal currency, with gold available for circulation?—Those are the steps, I quite agree, and if that statement of the case were correct I should agree with the conclusion. But it does not seem to me to be correct, for this reason; that although it may be more difficult with a small holder of hoards, at any rate in the case of large holders, even though the banks or the Government are under no obligation to give gold on demand when paying back their deposits, it is perfectly easy, provided the currency system is in proper operation, to get full value in gold by buying the gold in the market.

10,571. Let us follow that in two steps. Supposing we have a pure exchange standard, without even any gold coin as legal tender or a Mint; the effect claimed for a gold exchange standard soundly based and operated is that it stabilises the gold value of the rupee, and therefore that the rupee is worth as much

in gold at one time as at another. Having the rupee, the holder can always go to the bazaar and buy gold for it. His power, therefore, of restoring his gold holding is no less under that system than under the full gold standard?—As I understand the function of the gold market and the bazaar there is practically no difference. What I have suggested is that if there is some slight saving by being able to demand either bullion or standard coins at the bank as compared with getting it through the bazaar, that saving would be very slight compared with the loss of interest which would be incurred by keeping the gold in hoards and not depositing it at all; so that the economic balance is strongly in favour of depositing.

10,572. Nevertheless, under such a system there is lacking a visible link between the internal currency and gold, the real link being comparatively an invisible one, that is, the convertibility of the internal currency into some medium of international payment?—Yes.

10,573. What is your opinion of a suggestion that, in order to make such a visible link under an exchange standard, the obligation accepted in legal form by the currency authority should be to sell gold bars to a minimum amount, not for export only, but for any purpose?—When you say "for any purpose," may I ask whether——

10,574. Without inquiring for what purpose it was required?—What I was going to ask was this: do you suggest in such a gold exchange system you would have the mint ready to coin your gold free of charge?

10,575. No; we are proceeding on the assumption that that is omitted from the system?—Then all I can say is that it seems to me quite clear that such an undertaking would be justifiable or not according as the ordinary gold market in the bazaar functioned well or ill. It would really be taking the function of buying and selling gold out of the hands of the private dealer and placing it in the hands of the public department; and if the private dealers are doing it fairly well now, why should they not go on doing it?

10,576. That would be correct with this limitation, that in order to save the Central Bank from having to do the type of business which it would be impossible for it to do, that is, small retail business in gold, there should be a substantial minimum?—I was thinking more of the large scale man; I admit that it might be more difficult for the man who wanted to buy a sovereign or two or three sovereign's worth of gold; he would probably lose a good deal, and therefore if you assume that the transaction is limited in any case to the man who is dealing on a fairly large scale, then I think what I said holds good.

10,577. I understand your reply is that it is not worth while because, why should the Government undertake to do the type of business which will be done, if they do not do so, by private enterprise?—I must admit that I am not myself very intimately acquainted with the organisation of the gold market: I am assuming that it is fairly efficiently organised and that you could buy and sell on very small margins and that therefore what you suggest holds good. I may be incorrect in my understanding of the working of the gold market, but I do not think there is any real difficulty that way.

10,578. In your opinion, supposing such an obligation were to be undertaken by the Central Bank and there was no question of any forcing of rupees out of hoards by such a provision as a limitation of the legal tender of the rupee, would it result in any very great demand for the conversion of rupees in hoards into gold?—I cannot myself see that it would; I cannot see any clear reasons why it should.

10,579. I suppose one might say "if it is not done now, why should it be done hereafter?"—That is my felling.

10,580. Unless there is any new impulse?—Exactly; I see no new impulse. Of course we are living in times fairly close to those in which gold was not imported, and we have a certain leeway to make up; and possibly the publication of the grant of a new right may accelerate the pace at which people would exchange other forms of wealth for gold.

10,581. I think perhaps it might be as well to bring out the point which you emphasise in your original memorandum, and that is, as I understand, that you see nothing derogatory to India's status in a gold exchange standard?—Nothing whatever. I think that is an entire misapprehension due to the fact that public opinion is apt to be a generation or two behind what one might call expert opinion. Public opinion in this as in every other country is largely formed by a gradual percolation of such opinions as have been frequently expressed by great authorities in the past, like Lord Rothschild and others, that no currency is a good currency unless it is automatic or unless it has gold in circulation as an essential condition. Such statements are extremely common in documents which are now public property.

10,582. You say "It is quite indefensible to regard the loss incurred by the sale of Reverse Councils as a direct consequence of the exchange standard." You mean on certain occasions?—I was thinking of the one important occasion just after the attempt to maintain the rupee at 2s.

10,583. I rather gather that your meaning there could be amplified thus: that it was the result not of an exchange standard, but of a standard which was not perfected as an exchange standard or perhaps the working of which was not?—Exactly: I should say myself that the failure of the Indian currency system to some extent was obvious during that time; but the failure was less in degree than the failure in the English currency system: the one started from a gold gold exchange system and the other started from a gold standard system with gold currency. The breakdown was due to the general results of the war and no country in the world escaped a breakdown.

10,584. In your opinion has India ever had a true exchange standard? Let me point out the bearing of my question. It has been put before us in evidence that the Indian exchange standard was not a true exchange standard adequately protected, because, for instance, there was no legal obligation to sell the medium of international payment at the lower gold point and an agreed ratio?—I agree to that, and I do think that a satisfactory exchange standard must carry with it complete convertibility for purposes of international trade both up and down.

10,585. That convertibility must be based upon a defined ratio?—I think that is implied, although I do not see myself that logically it is implied; you might have a fairly wide ratio of exchange within which fluctuations were permitted.

10,586. May I raise that by a specific question? That is an interesting point in your memorandum. In paragraph (*d*) of your summary of opinions here you say: "India is a debtor country and not a creditor country in the sense involved in this controversy. The question of a normally favourable balance of trade is irrelevant." I am not sure that I quite follow the implications of that sentence?—What I was thinking of was this: that for example, in Keynes' book one of the reasons given in favour of an exchange standard is that it is more suitable to a debtor country. That point is often taken up in this way, that India for a period of years mostly has a favourable balance of trade and therefore it is said India is not a debtor country but a creditor country, at least it is not a debtor country in that sense. What I maintain is that the balance of trade, as measured in the statistics of imports and exports, showing an apparently favourable balance of trade in India's favour, has nothing whatever to do with the question at issue. I may be wrong, but as I read Keynes' argument it is this: One of the dangers that one has to protect oneself against is the danger of a sudden demand upon gold or its equivalent by any creditor. Suppose you have a war or threat of war, and people wish to realise gold; then the creditor country may demand the return of its re-

sources invested abroad in the form of gold; that therefore raises the question, not as to the normal balance of trade, but as to the balance of indebtedness, the balance of ultimate claims which one country has on another. Obviously India, it seems to me, has very much more foreign capital invested in its own borders than it has capital invested abroad, and therefore India is a debtor country in the sense raised in this discussion.

10,587. What is really relevant to consider from the point of view of this argument is that India is a borrower country and not a lender country?—She has a balance of outstanding debts and not a balance of outstanding credits. Besides, if I may suggest, is it not quite clear that no country can have a favourable balance of trade, in the sense which is so often suggested, except for a very short time? This is suggesting that India normally has a claim upon other countries which she can make use of in order to get gold for its banking purposes. That does not seem to me to follow at all.

10,588. The peculiar characteristic of India is, then, that although she is making money and saving money, she keeps those savings largely in the form of metals and borrows the capital which she requires for expansion from abroad?—Quite; of course if you assume that all hoards of gold are going to cease and that all gold that comes into the country can be utilised for banking purposes, for the moment, for a very short time, there would be an addition. More gold would go into the banks. As soon as that had happened the inevitable equality of imports and exports for a period would be established and you would be importing more commodities, other than gold; and therefore the balance of trade which seems to exist now would disappear in that sense.

10,589. Finally, in (*f*) you say: "The adoption of a gold standard currency would be costly, and would partly presume acquiescence on the part of the United States in parting with gold for a purpose that would cause a severe depression in her silver industry and a depreciation of her own stocks of silver." Have you had your attention called to a memorandum setting out certain suggestions for the introduction of a gold currency into India?—I think I have been sent a copy of it, but I am afraid I have not read it.

10,590. May I just put very briefly the outline of that scheme. The outline of the scheme, on which I wish to ask you one or two questions, is this. The object towards which India should finally work as regards its currency system is that of a fully convertible internal currency, that is convertible into gold, and gold as the standard coin available for circulation. Notes and rupees should be made convertible into gold. As regards rupees, there should be a transition period leading to a further stage when the rupee should be limited as legal tender and dethroned from the position of a standard coin; that the gold necessary in order to undertake this fresh obligation of making notes and rupees convertible into gold should be obtained in effect by closing down the sale of Council Bills for the purchase of sterling, thus keeping the gold point well up at or above the upper gold point and forcing the import of gold into the country, thus obtaining the necessary supplies of gold in order to obtain the full amount which would ultimately be necessary to raise credits in the world's gold centres and to support the operation. It is estimated that in order to carry this scheme into effect, in the course of ten years some 103 millions sterling of additional gold would be required for India. That is an estimate based upon the number of rupees now in hoards which might be presented for conversion. Part of the funds necessary would be obtained by selling the rupees converted and by selling off the 90 crores of silver now in the Government's paper currency reserve. Have you been able yourself to form any opinion as to what the cost of such a measure would be?—No, I am afraid not.

10,591. Or have you worked it out upon any other basis?—A year or two ago I tried to work out the quantitative estimate but I am afraid that I have not recently done so, and I should not like to suggest any quantitative statements.

10,592. Assuming that the fulfilment of this policy would involve the sale of some 200 crores of rupees of silver in the course of ten years, would you be able to express any opinion as to the effect of that upon the world's silver markets?—Over ten years?

10,593. Yes?—Would the unloading of the silver be regular and periodical or would it be at the discretion of some authority?

10,594. It would be at the discretion of the currency authority in control of the operation, but it is calculated that, in order to fulfil the estimate of the cost of the scheme and so on, the operation would have to be spread over ten years?—Yes; but wouldn't it make trouble if it were known that you were under an obligation to convert so much every month or every three months in ten years?

10,595. On the question of policy, I do not think it is contemplated that there would be any tying of the hands of those who are carrying it out that there should be any announcement that so much silver would be sold every month or every three months?—That would have a very different effect on the market.

10,596. That would be most imprudent?—That is why I asked the question. Well, it seems to me that my opinion on that point is probably of very little value because I don't know anything about the organisation of the silver market. What little I have heard is rather to this effect; that the silver market is concentrated in rather a few hands and that it would be quite easy, or might be quite easy, to bring about a combination so that if they knew that for a period of ten years large quantities of silver would come into the market at practically sacrifice prices if necessary—it might have a very profound effect. It rather turns on the extent to which the silver market is competitive or not, and that is a point about which I am not very well informed. But my impression is that it would be quite easy to control the buying price at least to some extent.

10,597. What you particularly call our attention to here is the question of the acquiescence by the United States in such a policy, which might be expected to depress their silver industry and depreciate any stocks of silver they hold?—I was of course arguing on the obvious lines that the United States is the outstanding holder of gold at the present time. If a very large sum of gold was wanted by India it would probably have to be obtained by negotiation with the United States Government. The United States might be quite glad to get rid of some of its gold. On the other hand, the United States is very much interested in silver, partly as the holder of a large silver reserve and partly as being a country in which the silver production is an important industry. It would therefore obviously provoke a good deal of popular comment in the United States, I take it, if it were known that she was conniving at an action which would throw upon the world's markets large quantities of silver and depress prices, and she might herself be forced, as she has been in the past, to take some action to revive the forward price of silver. I mean the Sherman Act for instance. That is only a line of thought which appeared to me worth suggesting.

10,598. Turning to the other side of the account, do you feel able to express any opinion as to the effect upon world gold prices of an additional demand, for Indian use, of some 100 odd millions sterling worth of gold spread over ten years, the first 50 millions being required pretty soon, and the second 50 millions being required in stages over the remaining ten years?—It seems to me quite obvious that it would exert a very considerable influence. I know words like "very considerable" are vague. But, for instance, when Germany in 1873 acquired 50 millions of gold in a short period in order to adopt the gold standard, it was regarded at the time as one of the most powerful influences tending to bring about a fall of gold prices

Whether it would have the effect of positively depressing gold prices depends, it seems to me, on whether one may expect normally a movement of prices in the other direction. That is to say, your increased demand for gold might merely counteract a tendency to rising prices. Some economists feel that in future—leaving out inferences as to the demand for gold—prices are likely to rise considerably, and they would like to see the demand for gold multiply so as to counteract that. Personally it seems to me almost impossible to prophesy. The possible reasons which may work for a fall of prices or rise of prices are many. I can see some reasons to expect a considerable rise of prices in future and some reasons that prices will fall, but which of these two opposite sets of influences will prevail I feel it impossible to say.

10,599. Might one fairly summarise your answer by putting it thus, that it is difficult, if not impossible, to foretell what the relation between the world's gold supply and the world's gold demand is going to be, but that such an additional demand as that for India to which I have referred would constitute a major factor in deciding the course of world prices?—Undoubtedly, that is exactly what I feel.

10,600. I understand that you are in favour of the transfer of the control of the note issue to the Imperial Bank if sufficiently centralised control over the policy of the bank be secured. Have you any definite proposals to make as regards the securing of that control, by what measures it should be established?—No. I am afraid I should not like to say. It is too much within a sphere of things with which I am not really familiar. I feel that a powerful element of popular control, I mean centralised Government control, is important. It is to some extent secured, is it not, in the constitution of the Imperial Bank? But whether it is at present adequate or in what way it should be increased, if necessary, I should not like to suggest. I was thinking when I wrote of a good deal of the reasoning which had been followed in America in developing the Federal Reserve system, and, as I follow that development, I think and rightly that they have laid a lot of stress on securing public control.

10,601. It has also provoked a good deal of criticism that the public control has gone too far in the direction of permitting political interference?—Quite so.

10,602. Nevertheless, I understand you consider that it is not within your province to make any more detailed proposals on this heading?—No.

10,603. Now let me finally turn to the question of the stabilising of the rupee and the ratio. I am not sure that I follow the opinion expressed in paragraph 3, where you say: "there are no immediate evils to be anticipated from leaving things as they are, provided that Government does not itself initiate changes from the prevailing exchange rate"?—What I meant was this, that Government holds such an important power at present over the exchange rate that it might exercise that power to force the rate up to 1s. 8d., 2s. or whatever point you adopt. I should myself think that Government would be wrong in attempting to use its power to force the rate away from the existing rate, assuming that existing rate to be the rate which the economic forces tended to stabilise.

10,604. Then, in short, you are in favour of leaving things as they are, in the sense that, whatever system is devised, it should accept the current rate as the rate at which the rupee should be maintained?—Exactly. Of course, I suppose there are arithmetical difficulties attaching to certain rates. I mean you might have to modify them slightly so as to get better aliquot parts or something of that sort. But apart from that it seems to me perfectly clear that any attempt to force the rate away from the existing rate either up or down would be attended by very serious and unnecessary evils.

10,605. One moment before we go on. As I understand it, the arithmetical difficulties in relation to the rupee and the pound sterling would only arise if the sovereign were to be a legal tender coin?—Well, they would arise, would they not, in some degree even if the sovereign were not a legal tender coin?

10,606. Apart from that, is there any difficulty in accepting such a rate as 1s. 6d., which is the existing rate, from the point of view of account keeping? Is it less or more difficult than any other rate for the purpose of cross calculation of accounts?—Well I should think it is a little less convenient than 1s. 4d. I do not know, but it seems to me that you can express fifteen rupees to the pound more easily than you can express Rs. 13 and a fraction or Rs. 12 and a fraction. It is rather like the question of a decimal system.

10,607. I think you expressed an opinion in favour of the current rate as against any other because of the disturbances which would be involved in introducing any other rate. Could you expand briefly what the feared disturbances are and what their evil consequences would be?—Well they seem to me to be the well-known results of an appreciating or a depreciating exchange which are all the more severe when these results take place quickly. In the first place, obviously, if you publish beforehand a statement that you are going soon to work to a 1s. 8d. rate, you introduce a speculative element into exchange dealings. I think if you suddenly announce that you are going to raise exchange to 1s. 8d., for example, people would immediately begin to deal in exchange for the purpose of sending it to England and bringing back according to the rise or fall of exchange, and you get a whole lot of operations of that sort. Then you upset of course the normal international price-levels, so that you affect importers and exporters, and it is unnecessary to refer to the bounty that is for a short time given to importers by a fall in exchange and *vice versâ*. I do not see any reason why you should give these bounties or impose these penalties on two different sets of the community. Then of course if you decide to raise the rate of exchange say to 1s. 8d. in a comparatively short time you would inevitably, it seems to me, depress Indian prices. That would affect all sorts of interest. It would rather tend to increase the the incidence of land revenue. It would increase the burden of indebtedness of the peasant, and so on. On the other hand if you were to depress the rate of exchange, of course you give bounties where you would impose penalties. You have a whole series of disturbances and, on the one hand unearned increments, and on the other hand unearned decrements, which it is one of the main objects of a currency system to avoid.

10,608. Referring to the seventh paragraph of your memorandum, am I right in understanding you are of opinion that there are some reasons worthy of consideration which point towards waiting for a period before an attempt is made to stabilise the rupee?—I think there is a great deal to be said for it. As I say, I am speaking of course perhaps without a minute knowledge as to the processes of stabilization by buying sterling and the rest of it, but I do not myself understand that they are accompanied by any serious difficulties. The one important argument in favour of waiting a little longer seems to me to be this, that if you are going to stabilize, you are going to stabilize in sterling, and the future of sterling is still rather uncertain. It appears to me quite possible that in order to maintain sterling on a gold basis, English prices may have to be considerably reduced. The policy of deflation may have to go further. If this is so, it would obviously affect the normal exchange rate current between India and England, so that supposing in the course of a year or two Indian prices were to remain, other things equal, unchanged, whereas English prices were to fall considerably, that would tend to bring about a new rate of exchange in India. In my view if

economic circumstances were moving rather strongly towards the establishment of an exchange rate a good deal wide of the rate which you had adopted, you might have to exert a good deal of counter-influence to maintain the rate which you had adopted. At the same time it would be wise, supposing you do anticipate a period of further instability in prices, particularly prices in England in relation to prices in India, it would be rather wise to have the double safety valve of a variable exchange and a variable price level instead of concentrating the whole of the effect on one of these two safety valves.

10,609. One cannot, of course, stabilise both exchange and internal prices. Your suggestion would seem to amount to this, that for a time you would allow exchange to vary in order that you should maintain a greater stability in Indian internal prices if necessary?—I would like to retain for a time the double safety valve. I do not want exchange to vary unnecessarily; I approve of what I may call the manipulation—to what extent it may be exercised I do not know—which is now helping to maintain a stable exchange rate, but if we found at any time that there were strong economic forces tending towards the reduction of Indian prices, and that that could be modified by a moderation of the exchange, I would certainly let the exchange rate move as well as let the price level move so as to divide the effect between them.

10,610. Let me fully follow your opinion. Is that a policy which you would recommend at any time? —I think myself I would recommend it for any country, at any time. To that extent I am a follower of Keynes.

10,611. Supposing the time had come when, with all prudence, you had adopted a perfected exchange standard and the central currency authority had undertaken the necessary obligations in order to maintain that exchange standard, that is, to buy and sell foreign currencies at the defined rate, even after that, supposing world prices were to move in one direction or another you would be prepared, as it were, to modify the machinery of the exchange standard to allow the rate of exchange to go in one direction or another in order to keep your internal prices stable?—Yes.

10,612. And this recommendation as regards the immediate future is only one of the probable effects of the general policy that you are prepared to recommend?—Might I perhaps put it slightly differently in this way, that I recommend inaction for a short further space in India, not with the idea that there will ultimately be a fairly wide margin of exchange, but because of the special difficulties that seem to me to stand in the way of stabilization now, which will be lessened after a year or two. The point which you put to me seems to me to be rather this, whether I am not in favour of a universal change of currency principle somewhat in the direction of what is commonly known as the tabular standard; in other words in currency legislation you should include a provision by which along with some index figure you vary your exchange rate. That of course, as I say, is moving in the direction of the tabular standard and I certainly agree with it.

10,613. You do agree with that?—Yes.

10,614. You would rather see a tabular standard adopted for India immediately than an exchange standard?—No, I think there are two or three difficulties in adopting a tabular standard for India immediately; first of all, the imperfect machinery at present existing for contraction, there is no satisfactory index number, and secondly perhaps it would be unwise for India to take the lead in an important currency development rather than some other country—I do not know, I have not thought it out really. Undoubtedly I think that is the kind of currency reform towards which the world will move in future.

10,615. Then your suggestion comes to this, does it not, that India should follow the tabular standard for a year or two until things settle down and then go on to an exchange standard, because there must be some kind of policy for the immediate future?—It does come to that I think.

10,616. Do not the difficulties due to the imperfection of statistics and machinery upon which to base your tabular standard apply with equal force to the immediate future?—No. I do not think so.

10,617. How soon would you allow exchange to go up and down at the present time?—I think you would have to have regard to the demand for currency and the movement of prices so far as you knew them, but I do not think you can be said to have a tabular standard although you are being guided by such influences as if you had it.

10,618. Would you trust the Calcutta index number as a safe basis for currency policy, and, if not, what would you trust?—I think at present you have to make use of the best index numbers that you have got.

10,619. What are the special difficulties in the immediate future which you foresee and to avoid which it would be worth while to wait?—As to the immediate difficulties, as I think I suggested, I feel very uncertain in my mind as to the course of sterling prices in the near future.

10,620. Do you foresee a practical possibility of sterling parting company with gold again?—There is a possibility I think, but I think it is very improbable. What I think is probable is that in order to maintain sterling on a gold basis, deflation in England would have to go further. In other words, sterling prices would fall, and if the exchange rate between England and India is purely a reflection of the ratio between the rupee prices and sterling prices, any fall of sterling prices would affect the exchange.

10,621. Assuming that sterling does not actually part company with gold, supposing the standard adopted for India be not a sterling exchange standard but definitely a gold exchange standard, would this movement of internal prices in England confront the Indian exchange with any difficulty?—I think so.

10,622. What is the nature of the difficulty?—To my mind it seems that it would follow from this that the greater part of India's foreign trade is with England, is in sterling, and therefore the exchange rate between sterling and the rupee depends upon these two price levels. Supposing you fix the Indian exchange in terms of gold and not in sterling and that then sterling prices remained the same, it would affect the exchange rate between London and Calcutta. The London rate would no longer be a sterling rate and it would be an important factor in determining the business between England and India.

10,623. Is it your opinion that internal prices in Great Britain have not yet adjusted themselves to the recent rise of sterling?—Yes; of course, the adjustment may come about by a rise of gold prices, I mean, the American prices.

10,624. You have no doubt followed the recent course of English internal prices?—Yes.

10,625. Do you expect a further fall?—I think it is very probable. I think it is by no means certain; because I think all forces tend to make it unnecessary. My own view is that at present the money cost having reached the point at which stable relations can be established between England and other foreign trading countries, one of two things is likely to happen: either foreign money costs will rise or English costs will fall. I understand that in Germany there is a very powerful movement in the direction of raising wages and so on, and that might cause prices to rise. The same thing might happen in France. You may get a rise of prices. But the adjustment must come in one direction or another. It is English costs that are too high rather than the other.

10,626. I observe that the prices in Great Britain, as measured by *The Economist* index number, have fallen from the index figure of 180 in December, 1924, to 165 last August, which I am afraid is the last figure which I have. Does not this suggest to you that, except for very minor adjustments, prices in England are now adjusted to the higher value of

sterling?—In many industries, no. I think certainly not. I think the great feature of prices in England at the present time is the want of true level. The Economist index number is the result of one set of prices, mainly articles of export and import, and I think they would show more prominently a fall than a large number of other prices for goods which are only for internal production and consumption. I think that probably exaggerates the extent of the real fall of prices.

10,627. Are there any other possible dislocations foreseeable in the near future which, in your opinion, make it prudent to wait?—There are, of course, the forces bearing upon the cost of gold. If a large quantity of gold, say 100 millions, is required by India within the next few years, a good deal of importance must attach to the commodity value at which that gold is purchased. Obviously, therefore, if the price of gold is likely to be a good deal higher in 10 years it will be wise for India, assuming that it is going to make this change some time or another, to buy it now.

10,628. What would be the effect upon India's foreign trade and India's requirements of foreign capital if, for a limited but indefinite period, it were to be known that there was to be no fixed point at which exchange would be maintained at any standard, and that it would be allowed to vary under the stress of natural forces only?—I should imagine that the foreign trade would go on happily and healthily.

10,629. In spite of the risk introduced into trade by the possibilities of fluctuations of exchange?—Is it not now probable that, in the absence of any clear reasons for expecting a movement of exchange in one direction or the other, all business transactions will be based on the assumption of the existing exchange? I do not see myself how businessmen or financiers who wish to make a profit by speculating in a rise or fall of change could do so at the present time.

10,630. I feel in a way that we are confronted with this dilemma, that either exchange is not going to vary under the stress of these natural forces, in which case it must stabilise at once, or it is going to have a tendency to vary, in which case all those additional risks that a varying exchange introduces into foreign trade will come into play?—Quite. But what I am suggesting is not that a definite and foreseeable movement of exchange will take place but that such a change may and will take place. It seems to me not the nature of change which is likely to be the basis of any widespread commercial transactions. If it takes place suddenly, it will have the disadvantages to which I have already referred. But you cannot avoid some evils following upon a change of relative international price levels. If you do not have your movement of exchange, as I have said, you have your movement of prices. The question is whether for a time you should not wait to see whether the trend of things is in the direction of the present rate or markedly away from it.

10,631. To summarise, in your opinion, in view of the possibility of fluctuations in world gold prices in the next year or two, India has more to gain during that period by a greater stability of internal prices at the expense of a possibility of less stability of the exchange rate?—Yes.

10,632. (*Prof. Coyajee.*) You favour the retention of the gold exchange standard in an improved form. But supposing it was decided to introduce gold currency, then there might be two courses of action open. One is to introduce it gradually and the other is to borrow a large amount of gold from abroad and put it into circulation at a stroke, and I would request you to consider the comparative merits of these two lines of policy. Might I make the suggestions in favour of either course of action? If a gold currency was to be established then two courses of action might be open. In the first place a large gold loan from abroad might be taken out and by that instrumentality the gold currency might be introduced in a short time. It has, however, been contended by some witnesses that there are greater advantages in a gradual introduction of the gold currency in India. I shall put to you some of the considerations. In the first place it has been argued that if we bring out the interest on the securities in our paper currency reserve and gold standard reserve only in the shape of gold, then in about a decade we might have a considerable amount of gold in hand and hence no sudden great demand might be made on the world's stock of gold and the difficulty of large borrowings would disappear. Would you agree that it is one of the advantages of the more gradual introduction?—Yes, just confining myself to simple yes or no. It seems to me that you cannot consider that by itself. There are other things, possible qualifications. Merely by itself, yes.

10,633. Another advantage might be suggested that while this preparatory stage is being conducted, a trial is being given to an improved form of gold exchange standard with the rupees in our hands, a line of retreat is kept open if the improved gold exchange standard is found to be quite satisfactory we might halt there. On the other hand, a shorter line of advance might be obtained towards a possible international gold exchange standard. Would you consider that an advantage of the more gradual introduction?—Your last question implies, does it not, that you are retaining the gold exchange standard?

10,634. It means that?—Are you putting gold in circulation in the form of coins?

10,635. We are opening a gold mint and people might import gold bullion and hand it over for coinage and in that way a certain amount of gold currency might be introduced?—Then would it not be the case that supposing it were necessary to retrace one's steps and go to a pure gold exchange standard or to the other standard, to the extent that the country already has gold in considerable circulation would be a complicating factor?

10,636. There is no difficulty about gold currency here?—Then the point resolves itself into this: whether keeping the gold exchange standard, you gradually accumulate a quantity of gold in addition to the existing gold standard reserve

10,637. Certainly?—Yes; I think myself that probably it would lead people to believe in the virtues of the exchange standard.

10,638. That might be so. So I have already suggested. Might I point out a possible third advantage? There are 90 crores of rupees in our various Government reserves. These rupees might be absorbed in the course of the preparatory stage in the ten years, or so, so that there might be no necessity to undergo a loss by selling them abroad. Is that another advantage?—Yes; I should think so.

10,639. Then a fourth possible advantage might be that the rupee hoards and the silver hoards which are now gradually being changed into gold hoards might automatically be completely converted into gold, during the preparatory stage, so that when the final declaration of gold currency comes and the dethronement of the rupee results, there might not be many rupees which would be brought forward and handed over to the Government for conversion?—Is that assumption compatible altogether with the one you previously raised, that you are going to absorb a considerable amount of rupee currency?

10,640. Yes?—You are going to absorb your 90 crores of rupee currency in the course of comparatively few years by waiting and so you get rid of the difficulty of having to melt them down.

10,641. Is not there parallel absorption of gold and rupees going on almost every year?—Yes; but to the extent that you are introducing, say gold currency over a period of years, just while you are waiting to absorb your silver currency you are making it more difficult.

10,642. Still to a certain extent both processes go on simultaneously?—Yes.

10,643. And finally the longer process of introduction presents a number of tests of public advantage and popular preference of currency. The opening of the mints is the first test of whether people do really

want gold currency, and then the option of convertibility, a period of option of convertibility, that is to say, Government if they like might give gold for rupees. All these are various tests of public demand and also of the nature and extent of the demand for gold currency in India and of its possibilities. Is not that an advantage of the slower process, these successive stages?—I am not quite sure on this point. You open the mints and mint gold and you give gold in exchange for rupees?

10,644. You open the mints and you coin bullion, and there is an optional convertibility, that is, Government may if they like give gold for rupees?—Could you not say whether they do or do not because it seems rather important?

10,645. The discretion might be left with them?—What I was thinking was where is the gradual nature of the process. If a gold mint is opened and if gold bullion is coined freely and if the Government give gold in exchange for rupees, how is that to be made gradual?

10,646. Because it will take a decade or so before the final stage is come to, the compulsory stage at which Government is bound to supply gold coin for rupees. There will even be a still later stage when the rupee may be deprived of its legal tender character. That will be the final stage at which we shall cut adrift from the gold exchange standard and embark on the high seas. So that there will be various stages for testing both our capacity for gold currency and the nature and extent of the demand?—It seems to me that if you opened a gold mint and you in practice offered to give gold in exchange for rupees it would be very difficult to keep control of the rate at which the conversion took place and therefore you would have to be prepared with almost the maximum quantity of gold at an early stage.

10,647. The rate will be the current rate, say 1s. 6d. Then people might bring in bullion if they liked at that rate?—Well that is the only difficulty that I see in making the thing really gradually.

10,648. (*Sir Purshotamdas Thakurdas.*) The gold exchange standard you recommend is in practice a sterling exchange standard?—Well I am afraid I have all along been going on the assumption that sterling is also gold.

10,649. But when sterling happens to be divorced from gold, the gold exchange standard you recommend for India will become a sterling exchange standard?—No, I think if I had to choose between a sterling exchange and a gold exchange on the assumption of the difference between the two that I should argue in favour of a gold exchange.

10,650. But in reply to the Chairman I heard you say with reference to your remarks in paragraph 5 of your statement that you recommended nothing to be done regarding stabilisation of exchange because you were uncertain of the course of sterling prices in London?—Yes.

10,651. If you prefer gold to sterling why have that apprehension?—I think that point was raised, if I understand you correctly, by the Chairman and I said that even if sterling were divorced from gold, any considerable change in sterling prices must react very powerfully on Indian exchange.

10,652. Would that reaction be any more in India than it could be in South Africa, for instance?—I think the proportion of trade between India and England is probably greater than in the case of South Africa, but I am afraid I do not know.

10,653. The proportion of trade between England and India as far as imports from outside are concerned is fairly large but as far as exports outside are concerned it is comparatively more in the case of foreign countries than in the case of the United Kingdom?—Is it not 50 per cent?

10,654. Yes, something like that. At any rate the import trade with the U.K. is much larger than the export trade, and it is the export trade that brings into India the money and relieves financial stringency. In spite of that fact would you recommend a sterling exchange standard or what might become a sterling exchange standard?—I have, I think, said that I should prefer a gold exchange standard, but I have been arguing all along on the assumption that the sterling exchange will be on a gold basis. If that is not so then I should prefer that India should be upon a gold basis.

10,655. In view of the uncertainty of the position, Professor, which you yourself apprehend, would not you recommend that a sterling exchange standard should be outside the serious consideration of this Commission?—I do not think I regard a departure of sterling from a gold basis as a probability in the reasonable future.

10,656. Then on what basis have you made this recommendation that we must not stabilise or think of stabilising exchange for some time still?—Because I think that English prices, in order to maintain a stable relation between sterling and gold are very likely to fall.

10,657. Even though the pound sterling may not be disconnected from the gold fine point?—Yes.

10,658. You have a preference for an exchange standard as against a gold standard on what I understood you to say was principle. Was my understanding of your opinion in that connection clear? On economic principle?—On the two grounds that I suggested, first that it is considerably cheaper, the ground of economy, and secondly on the ground of greater safety.

10,659. Greater safety, may I ask what you mean by that?—Economic safety. What I mean is this, that some of the larger disturbances that people sometimes consider possible and as likely to lead to a breakdown of the exchange standard would equally involve a beakdown of the gold standard. A gold standard is not a thing which cannot be disturbed or broken down.

10,660. Both are liable to breakdown under certain circumstances?—Exactly.

10,661. But would you agree as an economist, Professor, that the gold exchange standard needs greater management and manipulation and is liable to more manipulation than the pure gold standard?—My opinion is that if you include under the term currency system both the provision of legal tender currency and the organisation of representative money and the various management that is implied in the contraction and expansion of your currency, if you include all that, there seems to be no more management involved under a gold exchange standard than under a gold standard with a gold currency.

10,662. Yes. It has been said that in order to safely trust the exchange standard you must look out for what has been called a superman. Do you agree with that?—If that is so, I think it would stand condemned—if it were true that it depended on the appearance of a superman.

10,663. (*Sir Purshotamdas Thakurdas.*) Would you agree with this quotation that I am going to read to you: " A further objection in principle which seems to me to be a sound and very serious one is that such a scheme "—the scheme referred to is the exchange standard*—" would involve operations of a more or less secret character by the Treasury or by some other authority or authorised individuals as compared with the automatic process of the gold standard."

10,664. (*Chairman.*) What is that a quotation from?

10,665. (*Sir Purshotamdas Thakurdas.*) It is from a speech made by Mr. Goodenough, Chairman of the Barclay's Bank Limited?—I altogether fail to see the necessity for secrecy. Are not many of the operations which are now carried on in England in connection with the currency and which would be carried on even with a complete return to the pre-war system, secret in the sense that the deliberations which lead to the movement of the bank rate are secret. Those to my mind are implicit in any currency system.

10,666. Are the operations equally secret. The considerations may be secret but are the operations also secret? I mean when the operations take place they have to be done more publicly than in the case of an exchange standard?—Having made a decision

* *See* question 10,762 below.

it seems to me the actual operation is not secret under either system.

10,667. Do you think that as far as the automatic part of the systems is concerned, both sides are equally automatic or liable to be made equally automatic?—I should prefer to put it the other way; both are equally unautomatic, if one may use the word, both are managed.

10,668. Both run the same risk of management?—In different ways but they are managed in both cases and to about the same extent.

10,669. You don't think there is any substantial or serious difference in degree of the point up to which each can be managed?—I should like in answering that question to guard myself against being thought to hold that the exchange standard as it worked before the war was perfect. I do not think so.

10,670. We are thinking of the perfect exchange standard?—Then my answer is that I think the amount of management would be the same in both cases.

10,671. I forget if you told the Chairman in the course of his examination as to the directions in which you would like the pre-war exchange system in India to be perfected?—No, I do not think I did.

10,672. Would you mind telling us now because you have a big "If" in your reply. Would you mind telling us the directions in which you would like to see improvement?—Well I am afraid it is rather a big question. My own feeling is that the chief defect in the exchange standard as it existed before the War lay in the machinery for expanding and contracting the currency. What I think you need in that connection is a real power of expansion and contraction, that will work not only on Indian currency but on foreign currency. You will in that way bring into operation what in economic text-books is commonly known as the compensatory action of exchanges, a term with which I expect you are all familiar. I believe under the pre-war system there was not by any means a perfect method for expanding and contracting the currency, and that it did not operate in this two-fold direction upon prices. It is in that direction that I think the most important modifications need to be effected.

10,673. I then gather that your opinion is that in the pre-war exchange standard as it has been carried on till now there was and there has been too much management and manipulation, and you would like less of it and more of automatic action?—No, I do not think it can be expressed in that way. I do not think that the change that I would argue for involves less management: it only involves a somewhat different management.

10,674. More automatic action?—No, I do not think it is more automatic.

10,675. Then I would like to understand; I am afraid I have not been able to understand you clearly?—Well, I do not know how to explain what I mean in any way but this, that before the war the gold exchange standard existed without a satisfactory machinery for expanding the Indian currency in times of increasing demand, while at the same time operating on the gold reserves, say, of the Bank of England: that is to take one instance: the result was that while you were expanding rupee prices in India, you were not, as you ought to be also, acting on sterling prices in England.

10,676. That is the imperfection which you have indicated?—Yes.

10,677. You mean it was not adjusted to the price level in London?—Yes.

10,678. And you recommend perfection in that direction, by connecting the two systems in such a manner that with a depression in England a similar depression happens in India?—No, I do not think I would put it in terms of depression.

10,679. Would that not be the result of the change that you recommend?—No, I do not think so.

10,680. How would it benefit us?—I am trying to consider what is needed when you have a disturbance of relative price levels. Supposing you have good trade in India, you have a demand for more currency: that tends to raise prices in India when you put your new currency into circulation. Now the very circumstances that give rise to the need for a higher price level in India probably also mean that there is need for a reduced price level in England so as to establish equilibrium. If you draw your new currency which is coming into India in such a way as to be operative on English price levels, you will have a double force exerted instead of a single force. One of my suggestions is that the new currency which is coming into India operates on Indian price levels but it is not drawn, as it were, in such a way as to also operate on foreign price levels.

10,681. Are our reserves in any way operative on English price levels? Our reserves happen to be in England, but are they used for the purposes of English reserves in any way?—I think so, yes.

10,682. The gold standard reserve and the paper currency reserve are useful for the purpose of adjustments of price levels in England?—As I understand the machinery the gold standard reserve can be considerably increased without taking gold off the English market or taking it out of the gold reserve of England and so on.

10,683. Inasmuch as it is kept there it has a bearing on financial conditions in London; they are said to belong to India and indeed in some cases are said to have been earmarked for India?—Yes, that is so.

10,684. Even then they have an effect on the financial conditions in London?—My point is that they do not have sufficient effect on the price levels in England.

10,685. And you are seeking to make that effect complete?—More immediate.

10,686. To that extent you think that our exchange standard needs perfection?—Needs improvement, yes.

10,687. With a gold exchange standard as you recommend it, I understand you are not in favour of a gold currency at all?—I think it is an obvious waste of money.

10,688. Exactly: You think that India should carry on with rupees and the paper currency as she has been doing till now?—Well, I should think it would be an advantage if you substituted even a cheaper form of currency than silver rupees as far as possible.

10,689. Namely?—Some cheaper metal or paper to a larger extent.

10,690. And have a rupee somewhat depreciated from the present coin?—I do not know that I would agree with the word "depreciated." I would say "made of cheaper metal."

10,691. I use that word because I want to know if I understood you correctly?—If you made the rupee of some cheaper material than is used at present, it does not seem to me that it would depreciate it; it would depreciate its intrinsic value no doubt, but not its exchange value.

10,692. I was thinking of its intrinsic value? I believe you would still call it a rupee?—It would depreciate its intrinsic value, but that would be all to the good, would it not?

10,693. I am asking you whether you think it is feasible in view of the great efforts they made not to depreciate the rupee only seven or eight years ago: they went to all sorts of devices in order not to depreciate the intrinsic value of the rupee, did they not?—I agree, but I think the reason for that was not because a cheaper rupee would not have been preferable, on its merits, but because any attempt to substitute a cheaper rupee for a silver rupee at that time would have led to great political disturbance.

10,694. You think that the time for overlooking that fear is now ripe?—Do you ask me whether I think that at the present moment the silver rupee should be replaced by some cheaper coin?

10,695. Whether the time is ripe to think of replacing silver rupees by anything which is intrinsically worthless?—Yes; I would like to see it more largely displaced by notes.

10,696. The considerations which justified the Government of India in 1917-18 in opposing a depreciation of the rupee do not weigh with the same force to-day in your opinion?—I think what I said was not quite the same thing; I did not suggest that at present the silver rupee could be displaced by an aluminium rupee or some cheaper rupee without disturbing people and leading to unrest. I did not say that. What I said was that I felt it was desirable to displace the silver rupee as far as possible by money of a cheaper material.

10,697. What would be the difference between the two, a depreciated rupee and the rupee that you recommend?—My feeling is that you are gradually displacing the silver rupee to a large extent by issuing notes more and more.

10,698. Excuse me if I point out that the note is a promise to give silver on demand?—In so far as it is used as a substitute for rupees it is cheaper. But I understand in the case of the one-rupee note it was perhaps more expensive.

10,699. The one-rupee note is out of print any way; but the other paper currency has the confidence of the people because it is a promise to pay. You think that has nothing to do with it?—It has something to do with it, I think, yes; but I think that you can go on increasing the issue of the note instead of the rupee gradually and considerably without disturbing public confidence.

10,700. Gradually of course?—Yes.

10,701. How many years would it take, you think, before we can think of an inconvertible paper currency in India?—Inconvertible internally?

10,702. Inconvertible internally into the silver rupee. I ask that question because you use the word "gradually"?—I do not know, I am afraid.

10,703. You would not be prepared to say?—No.

10,704. Regarding delay in stabilising exchange, may I ask if the fact of an ineffective ratio being on the statute book is not a serious matter for the country, the ratio of 2s. ?—I should have thought it had no effect whatever.

10,705. Do you not think that when you can buy gold at 1s. 6d. (which is equivalent to Rs. 13-5-4 per sovereign) and when you cannot tender gold bullion or sovereign at the currency office except at Rs. 10 to the sovereign, do you not think that that is a serious handicap to the automatic expansion of currency in India?—It seems to me that that obviously is an anomaly; but it does not at present check the expansion of the currency. It shows that you have a law which is inoperative and useless and ought to be altered; but I do not think it checks the expansion of the currency in the country .

10,706. Is it not that which has allowed the Finance Member to have the power to which you refer, namely, to put up the rate to any point that he likes?—I do not think I suggested that the Finance Member could put up the rate to any point that he liked.

10,707. You suggested in reply to the Chairman, regarding your remarks in paragraph 5, when you were asked to explain what you had in your mind in saying "Provided that Government does not itself initiate changes from the prevailing exchange rate" or rather I understood you to say that unless Government raises the rate from 1s. 6d. to 2s. you thought that nothing should be done. That is what I was referring to?—What I said, or what I intended to say, was this: that Government has the power at present of modifying exchange; but I did not suggest that it had the power to put it up to any rate that it liked. Within limits, certainly, yes.

10,708. Which are the limits which the Government set before itself?—I do not know.

10,709. Which are the limits that they had at all before them?—I should say, judging by results, that the present object of the Government of India was to maintain the exchange rate more or less where it is; but I do not know; I have not the confidence of Government.

10,710. Supposing it had been pushed up to 1s. 7d. or 1s. 8d., the same thing could have been said?—All I have suggested is that Government would not be justified in pushing up exchange further than it now is.

10,711. And what is there to prevent them from doing so? Supposing the Finance Member wished to do so within the next six, or eight months, what is there to prevent him from doing so except his good will?—There is, I think, probably a good deal to prevent him pushing up exchange indefinitely and to a large extent. His power is a very limited one.

10,712. You think his power is a very limited one?—Yes.

10,713. With regard to the question of ratio, Professor Hamilton, I understood you to say that if the rate is put up to 1s. 8d. there will be all the disturbance which would be caused by unearned increments and unearned decrements. Would those disturbances be permanent or would they only be during the stage of transition?—I think they will be during the stage of transition undoubtedly.

10,714. What is the period you give in India for the stage of transition? How many years or months? When exchange is disturbed from one level to another, how long does it take for these various factors to adjust themselves?—I do not think you can possibly answer that, can you?. There are some long period contracts; for instance when the exchange was at about 1s. 10d. there was a contract entered into between the Secretary of State and the private railways to remit and receive funds at a rate of 1s. 10d. Everybody knows of course that the exchange value of silver fell very much from that point. That meant that for years and years the railways were gaining on their transactions in one direction and losing on another. Well, as long as those contracts continued, to that extent the disturbance continued. Probably for a large number of transactions the disturbing effect dies away very shortly after the actual movement has ceased.

10,715. The contract which you mentioned is of course a special contract?—Yes, but there are a lot of long period contracts in the financial dealings of a nation.

10,716. What do you think of the adjustment of wages with an appreciation of the rupee? Do you think that is required also to be adjusted in order to say that the mal-effects of the change had disappeared?—I think of course that in India as in other countries there is an obvious time-lag between wages and rising prices. But I think the adjustment takes place in India though irregularly and more slowly.

10,717. Is the time-lag the same?—It takes longer in India, I should say probably.

10,718. Would you look upon this mal-adjustment in wages which you say takes longer in India as a serious difficulty?—Regarded as a fact by itself in isolation?

10,719. Yes?—It is obviously an evil. But the same circumstances which lead to disparity between wages and prices to the detriment of the wage-earner may benefit other classes who are not wage-earners and it is extremely difficult for that reason to come to a final decision as to whether rising prices or falling prices for the moment benefit the people as a whole.

10,720. I was only asking you the general question. The other case I can only put to you when I have a concrete case to put to you. Now, under (*f*) of paragraph 9, you have this: "that would cause a severe depression in her silver industry and a depreciation of her own stocks of silver." Where you say "her own stocks of silver" do I understand you to mean the Government of India's stocks of silver or the stocks of silver of the people of India?—Neither. I mean the United States stocks of silver.

10,721. (*Sir Reginald Mant.*) Mr. Hamilton, why do you say that a gold exchange standard has greater safety than a gold standard with gold currency. I think that was the term you used?—My idea of its greater safety lies in this, that at times of severe strain which may be exerted on a currency system under a gold standard with a gold currency, you have in the country as one of the principal forms of money sovereigns or mohurs or whatever it may be, gold coins You have the custom of converting other forms of money into gold and so on. Now, when you displace the rupees as the chief media of exchange and substitute gold, then if a crisis comes about so that you have to go back on your gold and declare the notes inconvertible for example, I think the internal disturbance, the sense of distrust and unrest, would bo much greater than if you had a system such as the gold exchange standard where the silver rupee or a note based on silver in the first instance were the chief exchange media and any result of a crisis resulted in an alteration of the exchange rate, because the alteration of the exchange rate is not a fact which goes home to the minds of the people at all in the same way as, we will say, a sudden refusal to convert notes or rupees into gold, if that practice had become common throughout the country. So that I feel that, supposing you had a war or any kind of disturbance of a big kind which made it necessary for you to refuse complete convertibility, it would be less disturbing, particularly for a country like India if the derangement took the form, as it did during the war of a breakdown of foreign exchange rate than if it were to take the form of a sudden declaration that you could not convert your notes or your rupees into gold. That was one of the principal reasons why I thought one was safer than the other.

10,722. In both cases the system would have broken down, would it not?—Yes.

10,723. Then, if I understand you rightly, you consider that the results of the breakdown would be more serious in the case of the gold standard than in the case of the exchange standard?—Yes.

10,724. You said in reply to the Chairman that you were not in favour of opening the mints and introducing what has been called an optional gold currency, that is a limited amount without the obligation to convert notes into gold, because you consider it uneconomical and a compromise. I think those were the two objections you took to it?—Yes.

10,725. It would be less costly, would it not, than a full gold standard?—I am not sure that I feel convinced that it would be less costly. If you have a gold mint and a gold currency with any effective power on the part of the people to use those institutions, it would be possible to substitute gold and make that the chief medium instead of notes and rupees to an idefinite extent, and I do not see why the expenditure should be less than if you published a law to the effect that you had to give gold in exchange for notes at your banks. It would probably take place much more rapidly in the latter instance but I do not see that in the long run the effect should be any different. As I understand, it merely turns on this: what are the real obstacles which you are going to put in the way of the use of gold as currency? If those obstacles are effective, you retain your cheaper currency medium. If your obstacles are not effective, you don't retain it. If the opening of the mint is to give gold in exchange for rupees as people find it convenient, this is a real check upon the use of gold. If this is a tentative offer, well to that extent it is a half-way house and partly achieves the economy of the gold standard and partly sacrifices it. But unless you are moving towards a free gold currency, that is a currency to the fullest extent to which the people want it, and are prepared to use it, unless you are moving in that direction, then I can only regard the opening of a mint and the tentative offer to give gold in exchange for other forms of money as a partial sacrifice, perhaps. I think Cannan says: "Let India have a mint if it is merely a sort of toy with which they want to play." Well, if you are going to regard it in that light, then I think you ought to try to explain to the people of India that it is a toy and nothing but a toy.

10,726. That is much the same thing as what you mean when you call it a compromise?—Yes.

10,727. Well, I gather that you are prepared to compromise on the question of the gold standard. I think you said that there was a very strong sentiment for it?—Yes.

10,728. And that if the claims of sentiment outweighed the economic advantages of the exchange standard you would then advocate gold currency?—Yes.

10,729. Well, does not the half way house suggest itself as a reasonable compromise, as a less costly measure and going a certain way in the direction of meeting that sentiment?—Undoubtedly, yes. I think so.

10,730. Therefore, in calling it a compromiso you are not really condemning it?—No, I am not condemning it. But I would only say that I would rather try and convince the people of India that they were moving in the wrong direction. If they cannot be convinced, then I would say, by all means compromise.

10,731. (*Sir Alexander Murray.*) Mr. Hamilton, I think you indicate that it would be advisable for Government to do nothing that might cause exchango to break away from the prevailing rate?—Yes.

10,732. Now, was it Government action, or rather Government inaction that enabled the rate to rise to 1s. 4d.? Does the same argument you use for 1s. 6d. apply to 1s. 4d.?—Certainly.

10,733. And you merely make that statement because you accept the prevailing rato for the reason that it is the rate at the time we happen to be sitting. If we happened to be sitting a year ago, would you make the same statement?—I am afraid I am there plunging into a question of which I am very largely ignorant. But I have a feeling that a year or two years ago there were reasons why it was desirable to deflate, quite apart from the rate of exchange. I do not know whether I am right or wrong. But my impression is that then the banks were overladen with loans which they could not very easily recover; that part of the demand for additional currency was due to the fact that their reserves had been to some extent absorbed in that way. I am only guessing, but I feel that there were reasons why it was desired to put a certain check on the expansion of the currency at that time in order to restore a healthier monetary situation and, quite apart from the effect it might have on exchange.

10,734. I am putting it this way that wo have had it put to us. The Government might have intervened at 1s. 4d. when the exchange came to the rate of 1s. 4d. gold, just as they have intervened now to prevent it from going above 1s. 6d. gold. And you give a reason which has already been given by some people, that it was on account of the stringency that Government did not intervene to stabilise at 1s. 4d. but went on expanding the currency. You said to the Chairman that you would prefer adopting a policy of "wait and see" because you were afraid that fluctuations in price levels in other countries might show that the present rate might not be the one to stabilise at. Now, in October 1924, which is the date at which exchange was at 1s. 4d. gold, I find that the index numbers of wholesale prices in India—the index number in India was 181, in the United Kingdom it was 170, and in the United State of America it was 152, the difference between India and the United States of America being 30. Now in view of the reason you gave to the Chairman

for wishing to wait and see, I suppose that also was a good reason for not stabilising in October of last year?—I think that supports the argument.

10,735. If so, to take the index number of wholesale prices, the latest figures that we have available, I am going to give you the figures of the countries that have gone back to the gold standard. In the United Kingdom the latest figure for the index number I have got is 156, in the Netherlands it is 155, in Sweden it is 154, in Canada it is 160, in the United States of America it is 160, and in India it is I think 157?—Are those figures reduced to a common basis?

10,736. We are taking 100 as being the index number for 1914, the pre-war index number. Well now in view of that fact?—There does seem to be an extraordinary similarity.

10,737. Practically an increase from the pre-war level in wholesale prices in all those countries of from 57 to 60 per cent. Is it not your view that the conditions justify stabilization round about the present level at the present time?—No I do not think so, because I do not know how far we can accept those figures, and even so I do not think it follows that the basis of the prices in the different countries is necessarily stable. Let me put it this way: supposing at the moment, take Sweden and England, you have a rise of prices exactly the same in the two countries as compared with 1913. It would seem that their relative prices were normally stable. It does not seem to me to follow that this is so. Supposing for example that the effect of bringing about a certain price level in England is to throw out of employment 2 or 3 million people, and the effect of bringing about that price level in Sweden is exactly the reverse, i.e., to absorb a lot of people. That might therefore result in this, that you have got an equilibrium partly in your price levels but you find an inequilibrium in your industrial conditions, and in order to bring about a proper basis of international exchange you must not only have an equilibrium of price levels but you must have your conditions of work equal. In order to absorb 2 or 3 million people, you must reduce prices, and that would react on the other.

10,738. Sitting here as a Commission we have to make up our mind one way or the other and make a recommendation. Such a recommendation could only be based on the evidence that we get before us in the shape of statistics or other information. Now can you furnish us with anything over and above these index numbers that will enable us to arrive at the conditions prevailing in other countries, besides the wholesale price levels prevailing in other countries?—I do not think that I could refer you to documents. I should certainly suggest a preference to certain considerations which I have already suggested, the volume of employment or unemployment, the apparent depression or otherwise of industry, the demand for or rather the state of credit, the healthiness or unhealthiness of credit organizations, all those considerations ought to be taken into account.

10,739. We are not discussing the Keynes policy at present. The point at issue was whether we should go on to a gold standard or a gold exchange standard and later on to a gold standard and to stabilize at a particular rate, prices will then move in all gold standard countries in unison. Should we consider prices in the different countries at the present moment, and if you find prices more or less on a parity taking 100 as the pre-war level, does that not really indicate to you that we should at this moment stabilize?—So far as it goes, certainly.

10,740. It so happens that the other countries to which I have referred have gone back to the pre-war gold parity, the United Kingdom, Netherlands, Sweden, Canada, the United States of America. Why should we not go back to the old pre-war parity? I mean we are now at 1s. 6d., not on a 1s. 4d. basis. Do you suggest that because our prices now happen to be on a level with those of other countries that have gone back to the pre-war working gold parity, that we should stabilize at a rate that is not a pre-war rate in a sense?—I do not myself see any advantage in returning to the pre-war rate.

10,741. Why is it that France and Italy are now struggling to get back to the vicinity of the pre-war parity?—The chief reason I take it is the difference of price level, that they no doubt have a currency which maintains prices, a level which is inconsistent with the pre-war parity, that is the difficulty, and also of course a form of currency which is internationally exchangeable.

10,742. It has been suggested to us that all the adjustments are not complete, and in particular wages have been referred to. As you are aware, wages on the Bombay side have not come back in any way in spite of the fact that exchange has moved up. Now can you offer any remarks in that connection?—The obvious answer I think would be either that Bombay wages should be levelled up or that it would be a saving if you bring down prices to the previous level.

10,743. (*Chairman.*) Two suggestions which would equally be acceptable to Bombay?—It seems to me a sort of mathematical answer. Well personally I should say, go on striking until the Bombay mill-hand gets better wages.

10,744. (*Sir Alexander Murray.*) Well as a matter of fact we have been given a figure that shows that if 100 is taken as the pre-war index number for wages in Bombay, to-day's index number is 231 showing an increase in wages of 131 per cent. On the other hand, taking the cost of living in Bombay we have been given figures which show, taking the pre-war index number as 100, that the cost of living to-day in Bombay is 153. Now the cost of living has gone up 53 and wages in Bombay have gone up 131 per cent. Have you any remarks in that connection?—It simply means that your two propositions are incompatible. Your first proposition was that it was well known that Bombay wages had not risen.

10,745. I did not say that?—I thought that was your first point.

10,746. I only say that the adjustments have not taken place, and that wages have not gone down although exchange has gone up to 1s. 6d.,—the adjustments are not complete?—I beg your pardon. I understood you to say that it is well known that the Bombay worker was not receiving a rate of wage which had fully responded to the higher price level.

10,747. My question was that if exchange goes up, other conditions in India must respond to that, and one of the adjustments that has not been completed is that wages have not gone down in keeping with the increase in exchange?—My impression was rather the other way.

10,748. The figures as they have been given to us are that wages in Bombay have gone up 131 per cent., and the cost of living has gone up 53 per cent. Have you any remarks in that connection?—I would say, as I said before, that if that is so regarding that limited interest alone, justice would be done apparently by returning to a lower rate of exchange. We are working in this manner, that the lower rate of exchange would imply an inflation of prices, in other words a rise in the cost of living, in other words bringing the cost of living into proper relation with the existing wage rate.

10,749. You suggest that because the workers in Bombay have got 131 per cent. increase in wages, that therefore the cost of living should be increased also? Is it not the other way about?—Certainly that might be an adjustment. You mean that the wages of the mill operatives ought to be reduced? But I do not think myself that it would be a permanent basis for decision on the part of a Currency Commission that a certain limited class of wage-earners are getting unduly high wages and

therefore the exchange rate should be altered so as to bring back the proper wage level.

10,750. (*Sir Maneckji Dadabhoy.*) You have advocated a policy of inaction for some time on the ground that "with the progressive settlement of the currency problems in other countries and when England has become finally adjusted to the gold standard the course of world prices will be less variable and more obvious." Do you anticipate a very early settlement of this question in Europe?—I should say myself that the next year or two is likely to see a very marked progress in that direction.

10,751. And you think that India ought not lead?—My impression is that probably stabilization at the present time could be effected successfully, but I say that the number of disturbing elements at work are still sufficiently grave in their possible results to make it wise for us to wait a little longer.

10,752. But there is an element of indefiniteness about it?—Undoubtedly, yes.

10,753. It may be five years, it may be ten years or it may be fifteen years?—No; I was not thinking as long a period as that. After all, the next year or two is likely to see a very general settlement of international indebtedness, and a rapid adjustment of wages, and so on.

10,754. And you say this policy of waiting would affect the investment of foreign capital in India?—Undoubtedly; it is likely to affect it to some extent; the uncertainty as to the ultimate rate at which exchange would be stabilised might have some effect.

10,755. And as such, it would be prejudicial to Indian interests?—Yes; unless your object is to exclude foreign capital.

10,756. That is not mine. You stated that when Germany adopted the gold standard in 1873 it had to acquire 50 millions of gold at the initial stage. Will you please let me know how long it took to acquire that quantity?—I am speaking entirely from memory and it is many years since I had direct access to the source of my information; but I think it was acquired within a short period, about a year or less; but I am afraid I cannot speak with certainty; but it was certainly within a short period, say a year or two.

10,757. Can you give me any reference about this?—I could if you allow me to look it up. I cannot say off-hand; I will try.

10,758. Did this enormous acquisition of gold cause dislocation in the United States or England or any other part of the world in the price of precious metals?—I think I could give you that at once. It may be wrong; but my impression is that W. T. Lyton in his "History of Prices" refers to that and he mentions it as one of the important factors bringing about the appreciation of gold and the fall of prices which of course everybody knows. I am not quite sure but I think he mentions it.

10,759. (*Sir Rajendranath Mookerjee.*) I understand from your answers to the Chairman that you entertain some doubt as to the trade balance being in favour of India?—Yes.

10,760. Having regard to the fact that India has now acquired the right of imposing fiscal duties and is also gradually progressing in industrial development, don't you think that the imports would greatly be reduced and exports increased as years go on?—If I understand your question, it seems to me that it leads to the answer that apart from a quite short period disturbance, the old doctrine holds good that the value of imports and exports, taking everything into account, must be equal and that it is quite impossible for the value of imports to fall and the value of exports to increase. You may be balancing by importing gold. But it seems to be quite impossible that a country can really increase its exports and diminish its imports. That is why I say that the extent of balance of trade is relative, because for a reasonable period of time, the balance of trade must be equal in every country.

10,761. Theoretically?—And practically. In Japan where they were always arguing for the securing of what they called a favourable balance of trade, they could not succeed in doing so.

10,762. (*Chairman.*) Just before we close, I wish to refer to the interesting quotation* from Mr. Goodenough which was made use of by Sir Purshotamdas Thakurdas. I thought, erroneously, when listening to the quotation, that Mr. Goodenough was contrasting a gold exchange standard with a full gold standard. I see on reference to the actual text of the speech that he makes use of these words: "such a scheme would involve operations of a more or less secret character by the Treasury, or by some other authorised individuals, as compared with the automatic process of the gold standard." The gold standard referred to as the British standard is, in effect, the exchange standard, and the "scheme which would involve operations of a more or less secret character" is the scheme of stabilising internal prices, in other words, a currency based upon an index number. Sir Purshotamdas has unfortunately had to leave; but I put that to him and he agrees that the quotation really is an argument against a managed currency in the sense of the sort of currency advocated by Professor Keynes and not against an exchange standard currency of the sort which we were discussing earlier to-day. Is there any matter on which you desire to amplify any of the topics of our discussion?—No.

10,763. (*Chairman.*) The Commission is very much obliged to you for your assistance to-day and for your memorandum.

* *See* question 10,663 above.

(*The witness withdrew.*)

(*The Commission concluded its sittings in India.*)

APPENDIX.

SUPPLEMENTARY STATEMENT SUBMITTED BY MR. C. J. HAMILTON, M.A., UNIVERSITY PROFESSOR OF ECONOMICS, PATNA.

1. Successive enquires into the Indian Currency System have, since the Gold and Silver Commission of 1886, accepted the principle that, whatever conclusions are arrived at, they should be derived solely from a consideration of Indian interests. I fully endorse this principle. Moreover, I think the aim of currency reform should be to establish a system that would be free from any special difficulties that might arise in consequence of India becoming a self-governing Dominion.

2. At the present time it seems outside the bounds of practical politics to consider possible currency systems other than the Gold Exchange Standard and the Gold Standard. Thus it seems unnecessary to discuss the Silver Standard, or the Tabular Standard. But I should like to associate myself strongly with those economists who regard the so-called automatic gold standard as distinctly inferior to one that would secure a greater immunity from large price fluctuations.

3. There is no doubt that for some time past the majority of Indian publicists, politicians, and economists have strongly preferred a Gold Currency and Standard to an Exchange Standard with a token rupee as unlimited legal tender and, on the whole, I think the Government of India has shared this opinion. On the other hand, the weight of authority of English economists and of financial advisers to the British Government has been opposed to the adoption of the former system for India. I feel confident from a careful study of the history of these discussions that this difference of opinion has been due, not to any conflict of interest between England and India in which English authority has preferred English interests, but to a different interpretation of facts and arguments relative to India's advantage.

4. I think that, unless there can be shown to be a decided balance of advantage in favour of the Exchange Standard, the Gold Standard should be preferred in deference to Indian sentiment, although I have already asserted my opinion that material economic advantage should not be sacrificed to sentiment.

5. In arriving at a decision as to the real balance of advantage it may be useful to examine briefly certain leading arguments commonly advanced against the Exchange Standard.

(*a*) that it is "artificial," "managed," and, therefore, liable to suffer from manipulation and may easily break down.

Behind these rather vague terms lie the following notions:

(i) that reserves are kept to an undue extent in England, to the detriment of the Indian short loan market.

(ii) that there is difficulty and risk attaching to the calculation of the amount of the reserves.

(iii) that there is imperfect adjustment of the supply of currency to the demand, causing either redundancy or stringency.

(iv) that the currency difficulties of the War and post-war periods were in some way due to the Gold Exchange Standard, particularly the loss associated with the Reverse Councils operations.

In England the characteristic feature of the currency and banking systems prior to the war was the almost complete separation between the provision of legal tender money on the one hand and the supply of representative money and the discharge of international indebtedness on the other. Only in times of great crisis was "management" of the legal tender currency required through the power to suspend the Bank Act. Normally all the manipulation and management was thrown on the banking system. In India, for reasons that are apparent in the history of her monetary system, Government has been largely responsible for both functions and the element of management, often popularly attributed to the nature of the Indian currency system, is mainly the inevitable counterpart of the banking function.

It is scarcely conceivable that, for a long time to come, the elastic element in the medium of exchange in India should be almost entirely, as it is in England, bank money. It must consist of legal tender currency. Hence, within the currency system there must be found a place for the expansion and contraction, the substitution of one form for another, of the money of the country. This introduces management; whether the currency system is the Gold Exchange Standard, or the so-called automatic Gold Standard. A large part of the management might be handed over to the banks, but it would remain part of the currency system in the broad sense. If the implications of this truth were fully understood I think that many popular objections to the Exchange Standard would disappear.

6. A central objection to the Exchange Standard advanced by many in this country is based on the argument that it fails to command confidence and that this checks the investment of foreign capital and leads Indians to hoard their wealth in gold and jewels instead of depositing it in the banks.

A fluctuating exchange rate may check the investment of foreign capital. With a stable exchange rate the element of confidence will depend, in the case of foreign investors, upon the resources of the country and the Government which rules it, rather than upon the existence of a gold standard and currency or an exchange standard.

Internally the matter may be different, because, whether or no the exchange standard is inherently sound, there may be a wide-spead popular belief on the part of rich men that it is risky, with such a currency, to invest in such a way as to give a claim merely to a representative token money.

I do not think, however, that the habit of hoarding rests to any considerable extent upon a distrust of the rupee. It is rather the result of long habit, of social custom, of prestige, and the absence of banking facilities. Why should a man with hoarded wealth transfer his hoards to banks upon the adoption of a gold standard and currency when he would not do so otherwise?—With an exchange standard he can obtain gold when he wants it at the same cost as under a gold standard. The value of his bank deposits are as much gold values in the one case as the other. It may be said that with a gold currency and an open mint people could more easily convert their gold ornaments into currency in time of need. But, under the pre-war exchange standard there was nothing to prevent Indians from hoarding in the form of sovereigns if they wished. It is true that if these sovereigns were then deposited in banks there was no legal right to demand sovereigns on withdrawal. But with a free gold market deposits repaid in rupees could be turned into gold at a less cost than the loss of interest arising from hoarding.

7. The two great arguments for a Gold Exchange Standard are based on the contention that it is considerably cheaper and that it is safer. These two considerations are not entirely distinct. It has often been laid down in pre-war days that the people of India should be given the form of currency they demand. Sovereigns were, in practice, freely obtainable. If the pre-war practice were revived it is not certain that the actual use of gold currency would be very much greater with an automatic gold standard and currency than under the system as it was in 1913. To make rupees limited legal tender would probably lead to a greater use of gold for hoarding of considerable sums. There would therefore be a waste of resources on this account. It is also certain that a larger reserve of gold would be required than under a gold exchange system. The chief difference, as I understand, lies in the fact that an exchange standard implies the power to withhold gold in case of need without an evident and open departure from strict obligation. In the case of a gold standard it implies recourse to obvious inconvertibility. The reactions to the former are likely to be far less serious than to the latter. It seems to me that the risk of an external gold drain, provided the rate of exchange is to be kept constant, is the same under either system. But with an automatic gold standard there is but one consequence of a strong adverse balance of claims: an efflux of gold or of promptly marketable command over gold. With an exchange standard there is a double safety valve. The exchange rate may be allowed to alter somewhat beyond the gold point in case of necessity. The risk of an internal drain is of a twofold character. There is the initial risk that the adoption of legal convertibility together with the limitation to the legal tender character of the rupee would lead to a large conversion of silver. This risk seems to me sometimes to be exaggerated. There is also the recurrent risk that conversion would be demanded in large amounts in times of political and social crisis. This danger I think might be considerable.

For the reasons that I have given the exchange standard appears to me to offer manifest and important advantages over the gold standard and currency. These reasons appear to me sufficiently strong to justify the retention of the exchange standard even in the face of opposition from a popular sentiment that, in my opinion, is likely to weaken very considerably in the course of the near future.
